Joyst at every Board, then 6s.; others say 6s. 8d. or 7s. per Square." The lapse of 170 years saw a great difference in the builder's opinion as to the best widths for floor-boards, for Primatt in 1667 considered 14in. and 15in. the widths "most decent" for good boards; and in 1832 Richard Elsam wrote: "Dry, well-seasoned, clean yellow deal battens not more than 4in. or 4½in. wide are the best sort of boards which can be introduced for floorings, for the boards are less liable to shrink than when they are wider." Other things being equal, wide boards make better floors than narrow ones, for there are fewer joints in the same area, and there is much less labour in laying them. To use narrow boards only because they shrink less than wide ones is to encourage the builder to use unseasoned material. At the present day the commonest floors are laid with narrow boards, "folding." This means that five or six boards are cut to the same length and forced down on the joists into a space an inch or so less in width than they would occupy if they were laid together, side by side, without pressure. Suppose, for instance, that six boards are to be laid, each of which measures 6in. wide. Here the whole would cover 3ft., if laid side by side on the joists; but, as the boards would shrink if nailed down in this way, the two outer boards are first nailed firmly to the joists 2ft. 11in. apart, two more are laid flat against them, and the two last, which will not, of course, go into the 11in. space left, are laid down with their inner edges raised against each other: a board is placed traversing these, and the workman jumps on it,

squeezing the whole together, so that the six boards are driven into and occupy a space of 2ft. 11in. instead of 3ft. The ends of the six boards come together on one joist, an arrangement which is considered objectionable: when, therefore, a number of heading joints are seen to be in line in any floor, it is obvious the boards have been laid "folding." The next best floor is that in which the boards are laid "straight joint." In this kind of floor no two adjoining boards are cut to the same length, all the heading joints are broken, each board is laid singly with flooring "cramps," "irons," or "dogs," by means of which every board is forced tightly against that previously laid, before it is nailed down. In folded and straight-joint floors, when the boards shrink, dust and other matters pass through to the ceiling underneath, which is objectionable. To prevent this leakage, when boards were hand worked it was usual to rebate the under sides along both edges to a depth of about ¼in. and ½in. wide, so that when the boards were laid a fillet from 1½in. to 1¾in. wide was placed under the joints in the rebates of two adjoining boards; in some cases these fillets were let into the joists flush with their upper surfaces; such a floor was "rebated and filleted," or "filleted" only when the fillets were set flush in the joists. Boards are now "ploughed and tongued" in good work; in a floor of this kind each board is grooved on one edge and tongued on the other, the tongue fitting exactly into the groove; boards are sometimes grooved only on both edges, the tongues being of wood or hoop-iron; it is of great importance in this class of

work to keep the groove as near the underside of the board as possible to prevent the wood in the upper or face side of the board curling up through being too thin. The heading joints in all good floors should be broken, and the ends of the boards should be ploughed and tongued as well as the sides. A good floor is made by rebating each board on both edges, from the top at one side and from the bottom on the other side, the rebate being reversed in fact; the rebate may be made deeper from the face than from the underside, and shallower from the underside; this gives a good working thickness to the upper edge of the rebate. In a floor of this kind one edge of each board need only be nailed: the rebate secures the other edge under the nailed edge of the next board. Dowelled floors were much commoner in good work than they are at present. Nails are not seen in the boards of a floor of this kind, for they are driven skew through the edges of each board to the joists. The first board laid in a dowelled floor is nailed through the face, close to the wall, where the nails will be covered by the skirting, all the other boards are secured with nails and dowels which are completely hidden. A number of boards to be dowelled are placed on the bench side by side edge up, across these, at right angles to the face are ruled lines about 16in. or 18in. apart; down the centre of the edges of the boards other lines are marked, and the intersections of these with the cross lines give the position of the dowel holes, which are bored with a brace and bit to a depth of about 1in. or 1½in., and into these holes dowels, usually of oak and about the size of a lead pencil, are driven.

faces of some boards the wavy surfaces produced by the planing-irons are distinctly seen. It is not to be questioned that if the irons in a machine are carefully sharpened and run at a high velocity with ample power, whilst selected straight-grained stuff is passed through it at moderate speed, well-prepared boards can be obtained; but these are not the ordinary conditions under which boarding for commercial purposes is turned out, and it may be safely asserted that the surface of a machined board is never equal in finish to that of a hand-planed board turned out by a first-class joiner. Hand-prepared floor-boards were never planed on the under side; it was always left rough as from the saw, and the axe was used to thickness it when it rested on the joists. The accompanying sketches show floor-boards of different qualities from Sundswall, Gefle, Fredrickstadt, Domsjö, Holmsand, Dram, Kallskar, and Skonvik. Sapwood is seen in nearly all of them, and not one is converted as it should be for flooring—that is radially, as shown on the large log on the right. On this log A, B, and C are boards cut as they should be for a floor; but if these were cut at right angles to their present lines they would be unfit for the purpose, as the rings would scale up on the surfaces from traffic and repeated washing. The three floor-boards on the top over this log show properly converted boards, and the two rows under show improperly converted boards and waney-edged slabs, which should not be allowed in any building. Six sash-frame sills are also shown, to give some idea of the class of work now imported. The life of one of these sills cannot be much more than 10 years at the outside, yet they are extensively used in speculative building in and all round London. Lathwood from Petersburg and Riga is, as will be seen from the five examples given, nearly all sapwood, and this is the class of wood invariably used for laths at present when they are cleft in the country. The accompanying tables (on page 336) of the present wholesale prices of flooring and matching will be of great use to architects and surveyors, as well as to builders. The tabular form is adopted to facilitate easy reference.

A HANDBOOK ON BUILDING CONSTRUCTION.*

THIS book, to which we draw attention to-day, has already been previously noticed in the *Building News*; but readers will be glad to know that the publisher, Mr. Batsford, has just issued the fourth edition in a "thoroughly revised and much enlarged" form, the whole being compiled to assist students preparing for the May Examinations of the Royal Institute of British Architects, the Surveyors' Institution, and the Board of Education. The authors are Messrs. Charles F. and George A. Mitchell. The success of their well-known work is the best guarantee as to its thoroughness and up-to-date character which distinguishes the volume. In point of bulk it bids fair to approach speedily the portly form of the once famous "Gwilt's Encyclopedia." The handy use of a book is, however, impaired when it takes too thick a shape, and for this reason we should prefer the work in two volumes, though at the same time no doubt a duplicate index is always more or less a nuisance, especially when a reference has to be made in a hurry. In a somewhat large appendix in the edition now before us, the Board of Education syllabus, published only on August 1st, 1903, is given, together with the examination papers on Building Construction for the past four years, with their plans and diagrams complete. Other papers are reprinted from the War Office Surveyors' Examinations and the R.I.B.A. Final for 1902. The additions to this edition are notably chapters on Electric Bells, Lightning Conductors, and Lighting by Electricity, treated in a concise form. It is beyond our limitations of space to go at length through this admirable and practical book for students. It covers too large a field and comprises too many subjects to permit of such a notice, even if such an extended review could serve any purpose just now. Every student, whether he is going in for an examination or not, will find Mr. Mitchell's book on building a ready and valued friend.

YORK CITY ASYLUM.

[WITH ILLUSTRATIONS.]

THE land purchased by the corporation as an asylum site comprises 156 acres. Of this area 128 acres are situate in the parish of Naburn and 28 acres in the parish of Water Fulford. The whole of the new buildings, with the exception of the isolation hospital, will be erected in the latter parish, as shown on the block plan. The extreme length of the buildings from north-east to south-west is about 740ft., and the depth from north to south 450ft. The approach to the asylum will be from the north end of the estate—i.e., the end nearest to York. A lodge will be built at the entrance-gates, to be occupied by an employee of the asylum visiting committee. The present accommodation is for 362 patients, but the administrative department is sufficiently large to allow for a further extension of two ward blocks to accommodate 124 additional patients—viz., 74 females and 50 males, thus bringing up the total accommodation of the asylum when completed to 284 females and 202 males, making a grand total of 486. The buildings are arranged somewhat in the form of a fan, the handle being represented by the main approach avenue, the outer edge of the fan representing the ward blocks—i.e., the part of the asylum that will be devoted to the use of patients. There are three blocks on each side of the centre, all facing south-east; those on the north-east side are for males, and those on the south-west for females, with accommodation for two assistant medical superintendents placed between the two sections.

The accommodation provided is in accordance with the requirements of the Lunacy Commissioners. The following table contains the details:—

Female side—		Block A.	
Epileptic, ground floor	40		
Chronic, first floor	40		
			—80
		Block B.	
Recent and acute, ground floor	30		
ditto ditto first floor	30		
			—60
		Block C.	
Sick and infirm, ground floor	35		
ditto ditto first floor	35		
			—70
Total females			—210
Male side—		Block D.	
Sick and infirm, ground floor	25		
ditto ditto first floor	25		
			—50
		Block E.	
Recent and acute, ground floor	20		
ditto ditto first floor	20		
			—40
		Block F.	
Epileptic, ground floor	30		
Chronic, first floor	32		
			—62
Total males			—152
Total males and females			362
Female side—		Extension blocks.	
Chronic, ground and first floor			74
Male side—		Chronic, ground and first floor	50
Total extension blocks			—124
Grand total			486

At the end of the main avenue is the entrance block. This has been planned to face north-west, and will be the nearest building of the main block to the city. It will provide porter's room, medical superintendent's office, assistant medical superintendent's office, clerk's office, committee-room, luncheon-room, room for chaplain (also used as a library), bakery, and steward's office, with lavatories and other conveniences adjacent. The upper floor will contain officers' quarters. On the left of the entrance block, facing north-west, are the engine-house, boiler-house, and workshops, with the steward's yard, engineer's yard, and the workshop yard. On the right of the entrance block, facing north-west, is the laundry block, with drying-ground; also sewing-room and general bathroom for female patients.

The space between the ward blocks and the departments above described is occupied as follows:—In the centre the administrative block, including steward's store, kitchen with the necessary larders, storerooms, and sculleries. These are flanked on the right by female visiting-room, servants' and nurses' messrooms, and nurses' recreation-room, with servants' bedrooms on the first floor, the left flank being occupied by similar accommodation for the male staff and male attendants. Between the administrative department and the assistant medical officer's block is the dining and recreation hall; also accommodation for matron and head

attendant, together with a dispensary and pathological room. The assistant medical officer's quarters are placed between the male and female wards, and so as to overlook the airing-courts. The general bathroom for male patients and the workshops for cobbler and tailor are immediately behind the engine and boiler-house block. Separate entrances and exits are provided for each floor of the six ward blocks, the dayrooms on ground floor being provided with additional exits opening direct into the grounds; these will be glazed and serve as windows. The ceilings of first floor immediately under the roof will be fire-resisting, in accordance with the requirements of the Lunacy Commissioners. Corridors of communication are designed so as to give the shortest and most direct means of communication with the wards from the administrative department. Subways will be constructed under the corridors of communication, laundry-blocks, ward-blocks, dining and recreation hall, entrance-block, and administrative-block, &c. In these subways will be placed all steam-pipes, hot and cold water pipes, electric-cables, telephone-wires, &c., and the engineer in charge will by this means obtain access to pipes, cables, &c., without passing through the asylum.

A water-tower will be erected adjacent to the engine-house; the height to the bottom of tank will be 90ft., and the capacity 18,000 gallons. Pumps in duplicate will be used for supplying the water tank; the supply will be from the York Waterworks Company. Hydrants will be placed in suitable positions around the building inside and out. Specially large hydrants will be placed in suitable positions for supplying the Corporation Fire Engine. The inside hydrants will be placed in convenient positions with two or three lengths of hose attached to hydrant ready for use. Hose couplings will be Morris's Instantaneous, and will be similar in every way to, and interchangeable with, the fittings of the Corporation Fire Brigade. Fire alarms and telephones will be provided throughout the buildings. Rainwater will be stored in two underground tanks, and will be used for laundry purposes and boilers. In the event of rainwater giving out, York Waterworks Company's water will be used. The medical superintendent's house will be placed between the female side of the asylum and the Naburn-lane. Six cottages for the accommodation of employees will be erected adjoining the Naburn-lane, and the isolation hospital will be built about 550ft. to the north-east of the main asylum block.

The heating will be by means of exhaust steam from electric-lighting engines, pumps, &c., and will be augmented, when necessary, by live steam passed through a reducing valve and reduced thereby from boiler pressure to atmospheric pressure. The steam at atmospheric pressure will be drawn by means of a vacuum into the various radiators. Each of these will be controlled by a thermostatic valve. This will allow air and water of condensation to pass away through the vacuum mains to pump-room in engine-house block. Each radiator will be arranged so that the access of fresh air can be regulated before it passes over the radiators into the rooms. Foul air will be extracted by means of air-ducts leading to extraction towers placed between each ward block. Each of these towers will be provided with a heating coil (connected to hot-water system, so that it is available in summer and winter alike) to provide the necessary circulation of air through the buildings. The chapel will also be heated on the atmospheric system, and, like other parts of the asylum, will be supplied with steam direct from pump-room. The dining and recreation hall, however, will be heated and ventilated on the Plenum system—fresh air being drawn from a small tower by means of a fan, and forced through heating coils, after which it will pass along underground air-ducts and discharge into the room at a height of about 8ft. above floor level, through wall-flues connected with the underground air-duct. Vitiated air will discharge through a shaft carried above the roof. The hot-water supply will be generated by two tubular heaters fixed in pump-room. The heaters will be arranged with connections, so that exhaust steam from engines can be utilised all the year round. Whenever there is an insufficiency of exhaust steam, live steam will be supplied to the heaters. The heaters will be connected up in duplicate, so that they may be worked independently of each other. Circulating pipes will be laid along the subways, with branch circulations to all draw-off points. To insure quick circu-

* Advanced Building Construction. Fourth edition, 689 pages 8vo. Price 5s. 6d. London: B. T. Batsford, 1903.

lation throughout the system duplicate pumps will be placed near heaters in pump-room. Two Lancashire boilers, each 30ft. long by 7ft. 6in. diameter, and working at a pressure of 125lb. per square inch, will supply steam for engines and pumps. Additional steam required for heating, cooking, laundry, &c., will be reduced to required pressures.

The estimated cost of the work, exclusive of architect's fees, laying out airing courts and kitchen garden, is £133,000. This works out at £280 per bed, exclusive of land. The architect is Mr. A. Creer, Assoc.M.I.C.E., city surveyor, York. Mr. Jno. C. Light, is the clerk of the works.

OBITUARY.

MR. THOMAS WILKINSON WALLIS, the well-known carver, has passed to his rest, ripe in years. The eighth child of a Hull cabinet-maker, Thomas Wilkinson Wallis was born in Matchell-street in that town on February 4, 1821. At fourteen he was apprenticed to a carver and gilder named Thomas Ward, also of Hull, being "out of his time" in 1841, when he immediately started work as a journeyman for his old master at 24s. a week. In 1843 he went to Louth, and was in turn employed by a local carver named John Brown at a salary of 23s. a week. At the age of twenty-three he started in business, embarking thereupon his life savings, which amounted to £26 13s. 2d. Very soon his talent brought him well-earned reputation. He first exhibited in London at the Society of Arts, and later at the 1851 Great Exhibition. He was there awarded the gold medal, and at the Paris Exhibition of 1855, and the International one in London in 1862. A most diligent handicraftsman, his naturally rather weak eyes began to fail him seriously at forty. Since then the outcomings of his cunning hand had been limited. He became borough surveyor of Louth, occupying that position for some twenty years. Old age and infirmities telling upon him, his latter days have been spent mainly in his garden. As a portrait-painter he particularly excelled—a life-sized presentation picture in oils of Mr. Harry Hems, of Exeter (1901), a life-long friend and admirer of the venerable sculptor, being one of the many admirable works of the kind he produced. Mr. Wallis died on the 26th ult. in his 83rd year.

MR. HERBERT FORD, F.R.I.B.A., whose death at Blackheath on Tuesday week, at the age of 70, we briefly announced last week, had practised in the City as an architect for upwards of forty years. Mr. Ford was well known as an expert in the designing of woollen and silk warehouses, of which he had designed and superintended in the City some four hundred, in addition to planning many schools, private residences, and chapels. In later years Mr. Ford was associated as partner with Mr. W. J. Burrows, and to the firm was intrusted the carrying-out of such important blocks of buildings as Messrs. Pawsons and Leafs, and Messrs. J. Howell and Co., St. Paul's Churchyard; Messrs. J. Rotherham and Co.'s premises in Shoreditch; Messrs. Stapley and Smith's factory at Hackney, and extensive alterations to their London Wall premises; large blocks of offices in Cheapside, Milk-street, Aldermanbury, Holborn, and Southampton-row; intricate alterations to the Phoenix Assurance Company's premises in Lombard-street; the restoration of twelve warehouses demolished by the great Cripplegate fire; and several blocks of schools. Most of the buildings necessarily involved complex questions of party-walls, boundaries, and ancient lights.

MR. EDWARD RICHARDS, architect, of Torquay, died on Thursday morning in last week, at the age of 61 years, as the result of being thrown from his pony-trap on the previous Saturday, whereby he sustained a fracture of the skull and other injuries. Mr. Richards was well known and much respected in South Devon. As an architect, he had been identified with many public buildings in the town. His competition design a few years since for a pavilion was selected, but the scheme was afterwards abandoned. He was also architect to the Maldon manor for many years, an excellent vocalist, a prominent local Conservative, and a member of St. John's Lodge of Freemasons. He sought on one or two occasions to enter the town council, but his candidature was not successful.

The death took place at his residence, Daldri-shaig, Aborfoyle, on Monday of Mr. J. M. GALE,

who for 43 years, and until the close of last year, was chief water engineer of the Corporation of Glasgow. Mr. Gale was born at Ayr in 1830, and received his education in Ayr Academy, and later in the University of Glasgow. In 1855 he was appointed resident engineer on the Loch Katrine water scheme of the city of Glasgow, and four years later, on the completion of the works, engineer-in-chief. During his occupancy of that post he constructed a second aqueduct from Loch Katrine, doubling the water supply of the city. Mr. Gale occupied a high place in his profession, and was one of the most strenuous servants of the corporation. He resigned in December of last year owing to ill-health. He is survived by his widow and a son and daughter. His son is now chief assistant to Mr. Sutherland, who succeeded to the post formerly held by his old chief.

THE death of Mr. GEORGE BRINTON, partner in the firm of Messrs. Brinton and Bone, builders and contractors, Southampton, took place on Monday week at his residence in Westwood-road, at the comparatively early age of 56 years. The deceased gentleman, who has been seriously ill for some six months, was the eldest son of the late Mr. G. S. Brinton, J.P., of East Park House, who entertained Garibaldi on his visit to this country during the time that he was Mayor of Southampton in 1863. The funeral took place at the Southampton Cemetery on Thursday. A numerous deputation attended, representing the Southampton Master Builders' Association, of which the deceased was formerly president.

At Hammersmith, on Monday, an inquiry was held concerning the death of EDWARD B. SMITH, 49 years of age, a builder, of Mall-road, Hammersmith. The evidence showed that the deceased had been unnecessarily depressed because his business had not been so good as formerly. Early on Friday morning he was found insensible in bed, and died soon after the doctor arrived from carbolic acid poisoning. The purchase of a bottle of carbolic acid the day before was proved, the deceased telling the chemist that he was a builder, and wanted it for drains. A letter to the deceased's son, a private in the Rifle Brigade, at Cairo, was found, in which he wrote:—"Trade in London is exceptionally bad, and money is most awfully tight. I am far from well, and everything seems too trying for the nerves." A verdict of suicide whilst of unsound mind was returned.

CHIPS.

An addition was made to the tramway routes in Leeds on Wednesday week, when a new service of cars commenced to run from Malvern-road, Beeston-hill, to the Cardigan Arms, Kirkstall-road.

Sir Frederick Bramwell, the arbitrator appointed by the Board of Trade, will visit Rochdale next week to view the tramway lines which are about to be acquired by the corporation from a private company, and a long interval is not likely to elapse before the arbitration proceedings proper take place and the award is made. Sir Frederick has had many years' experience in this kind of work. It was on one of his awards that the Courts decided that the Act of 1870 prohibited any allowance for goodwill in the compulsory acquisition of tramways undertakings.

The great statue of Vercingetorix, which is being erected as a national memorial at Clermond-Ferrand, has been safely placed upon its pedestal, a work of some difficulty, in view of the fact that it weighs over 12 tons.

In the case of the application made for discharge on behalf of Edward Maynard, Brockley, Kent, builder, the discharge has been suspended for six months, ending Jan. 31, 1904.

The Archbishop of the West Indies has now received information about the damage resulting to Church property in Jamaica through the cyclone of August 11, and is appealing to English friends for help to meet it. Five churches were wrecked, 33 mission chapels destroyed, 44 mission chapels seriously damaged, 12 parsonages wrecked or seriously damaged. This list does not include many minor injuries, and the estimated cost of rebuilding and repairing is £15,000.

At the monthly meeting of the town council of Cheltenham on Monday the mayor announced that the new town-hall was expected to be ready for opening at the end of September or beginning of October. It was reported that the Local Government Board had given sanction to a loan of £14,447 for the purposes of wood-paving through the principal business streets along the route of the proposed tramway extension.

Building Intelligence.

BANGOR CATHEDRAL.—The formal reopening of the chancel of Bangor Cathedral after renovation took place on Friday. The whole of the fresco work has been carried through at the expense of Lord Penrhyn. During the period he held the archdeaconry of Bangor and Anglesey the late Dean Pryce was greatly concerned about the condition of the fresco work, which had considerably decayed, owing to damp and other causes, some of the figures having altogether disappeared. Immediately upon becoming dean he took in hand the work of renovation. The London firm who executed the original frescoes were engaged to renew the work in oil colours, and for them the decoration was carried out by Mr. Castle. A delineation of our Lord in Majesty, supported by angels bearing censers, fills the space above the east window, on each side of which are tiers of saints. On the south side, and on the lower tier on the north side as well as on the south, are also representations of saints and Apostles.

MANCHESTER.—The new hotel which the Midland Railway Co. have built close to the Central Station, Manchester, was opened on Saturday. The site covers two acres in Peter-street, and five years have been occupied in clearing the ground and putting up the new building. The architect is Mr. C. Trubshaw, and the contractors were Messrs. William Brown and Son, of Salford. The building is of six stories, and is 100ft. in height. For 26ft. from the pavement the front elevations are of red Aberdeen granite, with granite bands, and thence to the roof of terracotta blocks. The style is of a rather freely adapted Renaissance. The hotel overlooks Peter-street, Moseley-street, Mount-street, Windmill-street, and the open space of the Central Station yard, with which it is connected by a light iron-built, glass-roofed way. Brown vitrified terracotta is extensively used in the treatment of the building. The lofty walls of the inner building, rising on four sides high above the glass roof of the interior garden, are similarly treated with glazed white tiles. By a series of filter-screens of linen and coke hung across the windows all impurities are removed from the incoming air. Within the entrance hall are a post and telegraph office, a telephone exchange, and a railway booking-office. There is a large concert-hall, rich in variegated marbles; it will accommodate 850 persons. The panelling is of Cuban mahogany, and the style Louis XIV. There are several dining-rooms, including a French restaurant, coffee and grill rooms, and German restaurant. The grand dining-room is panelled in mahogany, with embellishments in gold; the ceiling is painted white, picked out with gold. A feature of the hotel is the arrangement of the rooms in suites, which are self-contained. There are 300 bedrooms. The suites grade into each other according to the periods—Elizabethan, Jacobean, Georgian, Louis XIV., and Adams all being utilised. The fireproof flooring has been carried out by Messrs. Mark Fawcett and Co., of London.

ROYAL ARCHITECTURAL MUSEUM.—The work of altering and adapting the buildings of the Royal Architectural Museum in Tufton-street, Westminster, for the purposes of the Architectural Association is now proceeding rapidly, from plans by Mr. Leonard Stokes, which are published in the current issue of the *A.A. Notes*. The evening school classes and studios will be accommodated on the first and second floors respectively, while the day school will have its studios on the third floor. The members' common room is situated on the ground floor, and arrangements will be made for supplying light refreshments as at present, while the reading room is provided in close proximity to the library, so that members may study or read quietly any books borrowed from the library either during the daytime or before their lectures or classes commence. The meeting room will be on the first floor, and will be an apartment 73ft. long by 25ft. wide. The museum will be open to the public as heretofore, but upon evenings when lectures are to be held members will be able to draw from the casts, the same facilities, of course, being afforded in the daytime. The contract entered into with Messrs. Holloway Brothers involves an expenditure of £8,440, and the expenses of furnishing and equipment will probably need a further sum of £1,500, making a total of about £10,000. Towards this the committee have

received in donations and promises about £4,500, so that a large balance still remains to be collected. Arrangements have already been made for a 999 years' lease, and Lady Day next will witness the removal of the Association to its new habitation.

CHIPS.

We regret to learn that Mr. Greville C. Hems, eldest son of Mr. Harry Hems, is still lying dangerously ill at Fair Park, Exeter. Three months ago an operation was performed, but without beneficial effect. He has been detained in bed since then, and is in a very precarious condition. Mr. Greville Hems is unmarried, and is thirty-four years of age.

The death occurred in Berlin on Monday of Professor Frederic von Kaulbach, one of the most famous of German portrait painters. In addition to a number of well-known popular pictures, he also painted the portraits of many members of the Courts of Hanover, Austria, Prussia, and Russia.

On Saturday, limestone was sent out from the new quarry near Bishop Middleham, Ferryhill, Co. Durham. The railway company supplied waggons for the first consignment. The quarry area is of considerable extent, and it is expected that before the end of the year employment will be found for 100 workmen.

At the last meeting of the Newcastle-on-Tyne city council the adjourned debate on the motion to confirm report of the new town-hall committee, recommending the council to approve of land in Northumberland-street and Northumberland-road, as a site for town-hall and municipal buildings, was resumed. An amendment was carried rejecting the proposed site as too expensive.

At Prudhoe-on-Tyne the foundation-stones were laid on Monday of a new parochial hall, estimated to cost about £1,500. A site adjacent to the vicarage has been given by the Duke of Northumberland. Messrs. Watson and Son, of Branch End, Stockfield, are the contractors, the architect being Mr. S. D. Robins, of Newcastle. The hall will measure 59ft. by 24ft. 6in., and will seat 500 persons.

The Rev. Michael Pryor appeals for donations towards the restoration and extension of Holy Trinity Church, at the Fort, Margate, of which he is vicar. The work is necessary, as the external fabric has been crumbling for some time, and the safety of the building is to some extent imperilled.

Good progress is being made with the restoration of the fine church of St. Margaret, Cley-by-the-Sea, Norfolk. The roof of the south nave and aisle and the roof of the north aisle are being renovated at a cost of £2,000, Messrs. Cornish and Gayer, of North Walsham, being the contractors. As funds permit, other works will be undertaken at an estimated further outlay of £5,000. These will include the repair of the west porch and the whole of the external masonry.

A stained-glass window has been erected in the Roman Catholic Church of Our Lady and St. Helen at Southend-on-Sea. The chief subject is the Crucifixion, the great central figure being attended by the Virgin and St. John, St. Mary Magdalene, Helen, and Joseph.

The Bishop of Bangor has laid the memorial stone of a church which is in course of erection, at an approximate cost of £4,000, at Nevin, a watering place on the north coast of South Carnarvonshire. The church has been designed by Mr. P. Shearson Gregory, architect, Bangor.

The memorial stone has been laid of the new Reformed Presbyterian Church at Larne. The building is being erected on the Curran-road, adjoining the new Victoria Orange Hall. The interior dimensions are 50ft. by 32ft., whilst the height to the eaves is 18ft. The total seating accommodation of the church will be about 330. Behind the church are situated a minister's room and a session room, divided by the heating chamber. Mr. J. Scott, Annandale-avenue, Belfast, is the architect of the new building, and Mr. Hewitt, Ballyhackamore, the builder.

The Housing Committee of the city council of Liverpool have received the sanction of the Local Government Board to the scheme for erecting 60 houses in Clive and Shelley-streets, Toxteth Park. The city surveyor, Mr. T. Sheldermine, has been instructed to obtain tenders.

At St. Mark's Church, Tunbridge Wells, an Italian Gothic building, erected eight-and-thirty years ago from the designs of Messrs. Roumieu and Aitchison, of London, a baptistery is about to be added as a western narthex, in accordance with the plans originally prepared by that firm. This will complete the architects' scheme.

A highway bridge is about to be built at Worthing, Norfolk, for the Mitford and Landitch Rural District Council. The engineer is Mr. Silcock, of Leeds.

COMPETITIONS.

JOHANNESBURG.—Mr. Thomas A. Moodie, who left Glasgow for South Africa to take up the position of principal architect of the Central South African Railway Company at Johannesburg, was recently selected as one of the architects to take part in the limited competition for the new railway offices at Johannesburg. Mr. Moodie's plans have now been selected, and arrangements are being made for the carrying out of his design, which is estimated to entail an expenditure of half a million sterling.

LIVERPOOL.—The Liverpool Corporation have invited seven architects to compete in a limited competition for the erection of new public baths, St. George's Dock. The seven names were selected from the competitors in the original competition for the St. George's Dock site baths in connection with which Sir William Emerson was the assessor. The three authors of the premiated designs in the first competition—viz., Messrs. Stones, Stones, and Sproakes, Messrs. Briggs, Wolstenholme, Hobbs, and Thornely, and Messrs. Matear, Simond, and Crawford—are included, and also Messrs. A. Hessel Tiltman, A. Saxon Snell, S. B. Russell, and H. Dighton Pearson. The buildings are to cost £75,000. The drawings (one-sixteenth scale sketch plans) are to be sent in on Sept. 24.

LURGAN.—The Lurgan Urban District Council has held a special meeting for the purpose of appointing an architect to design and superintend the erection of a free public library to be built on the new street off Market-street, on which a free site of 100ft. frontage has been granted by the council in conformity with the conditions on which Mr. Andrew Carnegie has offered a gift of £2,000. The recommendation of a special committee in favour of the appointment of Mr. Henry Hobart, C.E., Dromore, was unanimously adopted.

MANCHESTER.—A "Life Trustee" of the Manchester Royal Infirmary writes to the local journals objecting to the methods adopted by the Board for obtaining designs for the new infirmary proposed to be erected opposite Whitworth Park. The invitation of selected competitors is, he points out, more costly than open competition. Twelve architects have been invited to prepare designs for the infirmary, and each is to be paid £100—£1,200 in all. In the recent chief fire-station competition for Manchester, "Life Trustee" mentions, the corporation paid £300, and for the technical school £325, in premiums. In both cases some 20 to 30 designs were submitted by prominent architects from all parts of the country. Both these buildings are more complex and technical in planning and construction than an infirmary. "If," he adds, "the infirmary board had offered similar premiums they would have obtained some 20 or 30 or more designs from the best men, as the proposed buildings will be so extensive and prominent that every architect who has had experience in this class of work would have been tempted to compete. The board, by their unfortunate policy, have therefore involved the institution in a probable loss of about £800 without obtaining any advantage in return whatever, and they have, moreover, prevented a large number of experienced architects willing to compete from doing so, obviously to the direct injury of the institution, whose interests they are expected to safeguard." The "Life Trustee" proceeds to criticise the architects selected to compete, which he terms "crude in the extreme." "Thirteen in all are concerned—twelve competitors and one assessor. Three of the thirteen are Glasgow men. Two or three years ago the Glasgow authorities required plans for a large infirmary of 1,200 beds, and plans prepared by Messrs. Schultz and Howard, of London, were selected. Everyone would naturally expect that these architects would receive a pressing invitation to compete for the Manchester Infirmary, and that the Glasgow architects, either unwilling or unable to provide their own city with suitable plans, would have been passed over. But Messrs. Schultz and Howard are not competing, and of three Glasgow architects two are competitors and one is the assessor. Precisely the same want of consideration has occurred with reference to Manchester architects. In 1896 the late board arranged a competition for an infirmary to be erected on the present site. Most of the unsuccessful Manchester architects on that occasion have been asked to compete a second time, instead of others being offered an opportunity of doing so. Several of those who failed in 1896

have received a second invitation, and other architects desirous of competing have been rebuffed."

PONTEFRAC.—The Pontefract Town Council have approved the plans presented by Messrs. Garside and Pennington for the proposed free library for Pontefract. The new building will occupy a site in Salter-row on the present lawn in front of the municipal offices. The cost is estimated at £2,000, whereas Mr. Carnegie's offer was a grant of £2,250.

PROFESSIONAL AND TRADE SOCIETIES.

ARCHITECTURAL ASSOCIATION.—A visit of the members will be made to the city of Bath a fortnight hence. It is proposed to travel on Friday evening, September 25, and dine upon arrival. The Bath Stone Quarries will be visited early the next morning, and in the afternoon Mr. Mowbray A. Green has undertaken to conduct the party round the city. As the party must number 30, members wishing to take advantage of this interesting visit should communicate at once with the secretary, at 56, Great Marlborough-street, W.

SEWAGE MANAGERS IN LEEDS.—A meeting of the Association of Managers of Sewage Disposal Works was held on Saturday morning in the Queen's Hotel, Leeds. Mr. W. D. Scott-Moncrieff, the president, occupied the chair, and the attendance numbered about sixty members. The Lord Mayor (Ald. J. Ward) extended a welcome to the association, and remarked that the work of the association was of the first importance to all communities. They had in most cases to deal with a system of drainage put down when the idea of sewage being dealt with, more especially in respect of trade effluents, was foreign to the general mind, and the many difficulties which had to be overcome to-day would be the more easily dealt with by assembling, as they had done, in various centres and gaining what information they could about the experiments conducted in those places. The President then inaugurated the Yorkshire District Branch and presented certificates of membership, prophesying as he did so a successful career for the branch. Colonel Harding, Chairman of the Leeds Corporation Committee, explained the experiments recently made at the Knostrop and Rodley Sewage Works. He admitted that the Leeds drainage system was a somewhat ancient one. They could, however, convey 50,000,000 gallons to their works. The Knostrop works were antiquated, though at the time they were started they were considered sufficiently effective. They were only suitable for the treatment of solids, and their capacity had now become insufficient to enable them to carry out even processes of precipitation properly. The area was too small. Dealing with the experiments at Knostrop, he said they were begun in 1897, and the processes of contact filtration and trickling filtration originated by them were now carried out on a large and practical scale by Manchester and other large centres. At the conclusion of the address the members left on a visit of inspection to the various local sewage works under the guidance of Colonel Harding.

The marriage arranged between Mr. Hubert C. Corlette, A.R.I.B.A., of 2, New-square, Lincoln's Inn, second son of the late Canon J. C. Corlette, D.D., Oxon, rector of Ashfield, Sydney, N.S.W., and Florence Gwynedd, third daughter of Mr. Arthur D. Berrington, of Pant-y-goitre, Monmouthshire, will take place on October 7.

At the last meeting of the Meath County Council, held at Navan, there were twenty-two applications for the position of surveyor in the rural district of Dunshaughlin. Only two of these were proposed—viz., Thomas O'Brien, Swanlinbar, County Cavan, and C. L. Bomford, Kells, County Meath. The former was selected. A large percentage of the applications were from England.

St. Chad's Church, Shrewsbury, was reopened on Sunday, after undergoing renovation, including installation of the electric light. Messrs. Williams and Son, of Princess-street, Shrewsbury, carried out the works.

At Monday's meeting of Aberdeen Town Council a report was received from the gas and electric lighting committee recommending a retiring allowance of £250 per annum to Mr. Alexander Smith, who, after many years service, has, on account of continued ill-health, resigned the office of engineer of the Corporation Gasworks. On a division, the allowance was fixed at £150.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLVII., XLVIII., XLIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXVIII., LXXIX., LXXX., LXXXI., LXXXII., LXXXIII., LXXXIV., LXXXV., LXXXVI., LXXXVII., LXXXVIII., LXXXIX., LXXXX., LXXXXI., and LXXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 90c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

*. Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Correspondence.

BRICKS IN BRUNSWICK SQUARE.

To the Editor of the BUILDING NEWS.

SIR,—I have seen it lately stated that when the houses on the south side of Brunswick-square, London, were erected during the early part of the last century, the builders, to evade the brick-tax then in vogue, built the lower parts of these dwellings in bricks of enormous size, and, also, that before the upper walls were executed the tax had been taken off, when bricks of ordinary size were employed. Can any of your readers furnish further particulars, or give other instances of this amusing evasion of the law?—I am, &c.,

A BRICKLAYER.

Re HERBERT FORD, DECEASED.

SIR,—Advertising to your Obituary notice in last week's issue of the BUILDING NEWS, we beg to inform you that Mr. Hesketh's connection

with this firm ceased many years since, and that the practice has for years past been carried on by your obedient servants,

FORD, SON, AND BURROWS.
21, Aldermanbury, E.C., London.
Sept. 9, 1903.

Intercommunication.

QUESTIONS.

[12002.]—Norwich.—The week before last, in a notice of a guide book descriptive of Great Yarmouth, incidental reference was made in your columns to the architectural attractions of the neighbouring city of Norwich. Can any reader give me from recent experience particulars of buildings in that city worth sketching and photographing, and what facilities exist for getting into these edifices? I don't want hashed guides, but personal tips from some recent open-eyed visitor, and in time for my holidays beginning on Saturday week.—PENCIL POINT.

REPLIES.

[12000.]—Supporting Tank.—900 gallons equals $\times 10\text{lb.}$ per gallon, 9,000 gallons, or a little over 4 tons in weight, plus the weight of tank. "Notes on Building Construction," Part 4, of Longmans and Co., in Table 1a, on "Safe Resistances of Materials." I take the section on compression. Brickwork, stock, 0.8wt. per square inch; brickwork, cement, 0.8wt. per square inch; brickwork, cement (3), 0.8wt. per square inch. So perhaps you can work this out from these data. B. T. Batsford, High Holborn, stocks.—REGENT'S PARK.

LEGAL INTELLIGENCE.

IN RE A. BARNETT, OF WELLINGTON, SALOP.—A statement of affairs has been issued as to the position of Andrew Burnett, architect and surveyor, of Wrekin-road, Wellington, Salop, who underwent his public examination at Madeley Bankruptcy Court on Wednesday last. The liabilities shown are £356 17s. 2d., and the assets are put at £2 19s., leaving a deficiency of £353 18s. 2d. The cause of failure alleged by the debtor is that his income was insufficient to pay household and personal expenses. From the Official Receiver's observations it appears that debtor has been in practice on his own account at Wellington for the past three years. Previously he was employed as an assistant with a firm of architects in Wellington, and before that in a similar capacity in Birmingham. There are practically no assets disclosed in the statement of affairs, part of the furniture at the debtor's house in Wrekin-road being hired, and the remainder is claimed by his wife, as having been purchased out of her separate income. Of the total unsecured liabilities, £145 represents money lent, and the balance is owing to sixty tradespeople in Wellington and various places, in respect of household and personal accounts, mostly incurred during the present year.

The committee formed to consider the erection of a memorial to the Warwickshire soldiers who fell in the South African war met at the Shire Hall, Warwick, on Saturday afternoon, Lord Leigh presiding. It was decided that the memorial should take the form of a marble tablet in St. Mary's Church, Warwick, on which the names of the men of the Warwickshire regiment who lost their lives in South Africa should appear, and that Mr. Albert Toft should be asked to submit a design for the tablet, he being informed that the whole funds available are £300.

At Saturday's meeting of the Metropolitan Asylums Board the works committee reported that the whole of the buildings comprised in Messrs. Leslie and Co.'s second contract for the erection of the Joyce-green Hospital had been handed over, some on June 23 and the remainder on July 27. The committee had approved the action taken by the chairman of the committee, Mr. J. T. Helby, in having authorised the engineer to the Board to carry out works with a view to remedying serious defects in the fire alarm system of the Park Hospital, at a total cost of about £80. The committee recommended that the tender of Messrs. Charles B. Roberts and Co., of Redhill, be accepted for the execution, at the cost of £12,950, of fire-resisting works, alterations, and additions at the Fountain Hospital, in accordance with the plans and specifications prepared by Messrs. T. W. Alwinckle and Son, architects. This recommendation was adopted.

The isolation hospital, Ticehurst, Sussex, is being warmed and ventilated by means of Shorland's patent Manchester grates and exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Cape to Cairo Railway is now making rapid progress northwards from the Cap. The line has been carried forward by the Chartered Company to the Waukie Coalfields, which are 200 miles north of Bulawayo and some 70 miles south of the Victoria Falls.

WATER SUPPLY AND SANITARY MATTERS.

ARBOATH.—The town council have adopted the recommendation of the committee on water supply to draw upon the waters of the Niran, a stream twenty-one miles north-west of the town, which is estimated to be capable of supplying 4,000,000 gals. per diem. Piping will be laid to convey over 1,000,000 gals. daily to Arbroath. The total cost is estimated at about £30,000. The present supply is an underground one, which will be retained until this new gravitation supply is brought to the town. Messrs. Crouch and Hogg, engineers, Glasgow, have been instructed to make a survey of the ground, and bring up a report.

LYNDHURST.—The rural district council have unanimously accepted the tender of Mr. Samuel Wood, of Bristol, for £8,839, to carry out the scheme of sewerage and sewage disposal prepared by their engineers, Messrs. Combes, W. B. G. Bennett, Son, and Berry, of Midland Bank Chambers, Southampton. The work includes the sewerage of Lyndhurst with Emery Down and Bank, and the disposal of the sewage at Fox Hill and Bank. Considerable care had to be exercised in the designing of the disposal works, as the effluent has to be discharged into the Forest streams. A joint inquiry was held by the Local Government Board and the Woods and Forests Commissioners before their sanction was given. It was decided to install at both sites duplicate detritus chambers and open bacterial tanks, and circular percolating beds with automatic revolving sprinklers. These works require but little fall, and will cost about £1,100. The tenders, of which there were nineteen, came well under the engineers' estimate, which was £10,000.

CHIPS.

Lord Armstrong laid at Walsend, yesterday (Thursday) afternoon, the foundation-stone of the Victoria Memorial Parish Hall, in connection with St. Peter's Church. The new building will serve as a parochial hall, Sunday-school, mission-room, and reading and recreation-room. It will cost £2,500, exclusive of furnishings, and occupies a site at the corner of Durham-street and Charlotte-street.

The members of the Peterhead Master Builders' Association have elected the following officers for the forthcoming year:—President, Mr. William Hadden; vice-president, Mr. John Davidson; secretary and treasurer, Mr. A. Clark-Martin.

Estate of the gross value of £44,432, including net personality £13,674, has been left by the late Mr. Herbert Dornier, civil engineer, late of Manchester, who died at Harrogate on July 10.

The sales at the Mart, Tokenhouse-yard, last week, as registered at the Estate Exchange, amounted to £5,805, and for the corresponding week of last year to £8,840.

At the last meeting of the South Stoneham Board of Guardians it was decided to carry out works of fire protection and provision for escape at the workhouse at Westend, in accordance with plans prepared by their architect, Mr. Mitchell, of Southampton, and subject to the approval of the Local Government Board. The estimated cost is £750.

The parks committee of the Bradford City Council have decided to purchase six acres of land in Snakehill-lane, from the Illingworth family, for the purposes of a public park for Gillington.

The ceremony of laying the memorial stone of the Sutherland Technical School was performed at Golsie on Tuesday by Lord Balfour of Burleigh, Secretary for Scotland. Donations to the building fund have been made of £5,000 each from the Duke of Sutherland and Mr. Carnegie. Instruction will be given in building construction, manual training in woodwork and metal-work, drawing, carving, design, modelling, and other subjects.

The internal alterations at the City Temple, Holborn Viaduct, just completed, have included the removal of Dr. Parker's rostrum below the pulpit, new ventilating and heating apparatus, and the substitution of the electric light for gas. The outlay has been over £6,000.

At Tuesday's meeting of the Berwick Town Council it was announced that the Local Government Board had authorised the borrowing of £1,445 for improvement works at the seaside resort of Spittal. The council will take steps to purchase old cannon from the War Office for the adornment of the ramparts. Berwick streets will be lighted by electricity in the middle of October.

A largely-attended and influential meeting of clergy and laity was yesterday held at the Royal Pavilion, Brighton, to consider the provision of a memorial to the late Archdeacon Mount. It was decided to erect a memorial in Chichester Cathedral, and a committee was appointed to determine the form it should take.

THE "CHURCH TIMES" AND GEORGE BELL AND SON'S NEW OFFICES, PORTUGAL STREET, W.C.—WYKEHAM HATCH, BYFLEET.—DESIGN FOR A LONDON STREET FRONT.—ENTRANCE TO A HOUSE AT HAMPSHIRE.—NEW OFFICE PREMISES, NOTTINGHAM.—PROPOSED FLATS AT SHEPHERD'S BUSH.—BRACELEY COTTAGE, CAMPDEN HILL PLACE, W.—BEACON TOWER, CORTACHY, N.B.—YORK CITY ASYLUM.

Our Illustrations.

NEW PREMISES FOR THE "CHURCH TIMES" AND GEO. BELL AND SONS, PORTUGAL STREET, W.C.

THESE buildings are now being erected in Portugal-street, W.C., for the *Church Times* and Messrs. Geo. Bell and sons (publishers). They are being faced in red bricks, with somewhat lighter bricks for the dressings. Portland stone has been used for some of the work, but this has been sparingly done to avoid expense. The cornice is cement painted white. The builders are Messrs. Chisholm and Co., Kensall-green. The architect is Mr. Horace Field. The drawing which we give was exhibited at this year's Royal Academy.

WYKEHAM HATCH, BYFLEET.

THIS Surrey house in brick with stone sparingly used is from the designs of Mr. F. Steward Taylor, architect. The gables, treated after the form of Georgian pediments, are plastered, and a feature is made of the entrance with its Ionic columns. The walling is in red facings.

DESIGN FOR A STREET FRONT.

THE ground floor is occupied by a restaurant approached by a door on the left of two elevations. The first floor contains offices, the remaining floors workshops, &c. These are approached by the door on the right. The front is treated with red facing bricks and Portland stone. The woodwork in shop-front and window-frames is oak. Mr. Amian L. Champneys, B.A., is the architect. The drawing appeared at the Royal Academy this summer.

ENTRANCE TO A HOUSE AT HAMPSHIRE.

THE illustration shows the treatment of decoration applied to the entrance-hall of a house at Hampshire, and includes a new staircase, vestibule screen, and the walls lined with pine framing, all finished white. Above the framing is a stencilled decorated frieze in four colours. The ceiling is panelled out with broad flat ribs and new cornice, the former decorated with slight stencillings in red and grey. The newel lamp is in wrought iron. The drawing in water colour was hung in the 1902 Royal Academy Exhibition, and the architect is Mr. Arthur H. Moore, A.R.I.B.A., of Bedford-row, W.C.

NEW OFFICE PREMISES, NOTTINGHAM.

THE premises shown, situated at 41, Parliament-street, Nottingham, are offices with shops under erected, by the architects, Messrs. Brewill and Baily, for their own use, on the site of the Old Sun House. The ground story is constructed of black granite with stone frieze and cornice, and

the upper part of small red sand bricks, with stone quoins. The window-frames and main cornice being of wood, painted white, and the windows are all fitted with iron casements and lead lights. The entrance porch is panelled with oak, and the hall with painted pine in large Georgian panels, and paved with squares of black and white marble. The principal rooms on the first floor also are panelled in various periods. The main staircase is of oak, and the floors are of wood block throughout. The work has been carried out by Mr. W. Appleby, contractor, of Lenton Boulevard, Nottingham.

PROPOSED FLATS, SHEPHERD'S BUSH.

THESE flats were proposed to be built on a site facing Shepherd's Bush-green. The materials would be red brick facings for the walls, with Portland stone dressings round the entrances. The roofs would be covered with green Westmoreland slates, and the joinery to verges, eaves, and windows would be painted white. The architects are Messrs. Clarke and Warwick, of Lancaster-road, W. The drawing reproduced was shown at the Royal Academy this year.

BRACELEY COTTAGE, CAMPDEN HILL PLACE, W.

THE illustration of the above shows the new wing lately erected. Externally the walls are finished in roughcast, except plinth to angle bay window, this plinth being in yellow stock bricks. The roof is slated to match present work. The contract was let to Messrs. B. Colley and Sons, Portland-road, Notting Hill. The architect is Mr. W. H. Raiffes, Gray's Inn-square, W.C.

BEACON TOWER, CORTACHY, N.B.

THIS tower has been erected as a memorial to the late Earl of Airlie, who was killed in action at Diamond Hill, near Pretoria. It is 70ft. high, occupies a site on Tulla Hill 1,230ft. above sea level, and is arranged as a beacon tower, to be used on occasions of estate or national rejoicings. The whole is built in rock-faced local red sandstone, the base being relieved with carved panels of the Airlie arms and the badges of the regiments in which the late Earl served—viz., Scots Guards, 10th Hussars, 12th Lancers, "The Bays," and Hants Yeomanry. The work has been carried out from designs prepared by Mr. T. Martin Cappon, F.R.I.B.A., selected in competition.

YORK CITY ASYLUM.

(For description see p. 337).

CHIPS.

THE willy imaginative report published by the Daily Press at the beginning of the week to the effect that an American syndicate contemplated buying up the Bull Clay Mines in Devonshire and Dorsetshire, upon which the pottery industry depends, is obviously without foundation. Inquiries of leading manufacturers show that no offer has even been made, and that it is impossible for Americans to buy up these mines, as all the property mined is entailed.

THE inhabitants of Aysgarth are going to have presented to them a fine Cambridge quarter-chime clock, showing the time upon two large external dials, to be fixed in the tower of their parish church. The clock and chiming will be from the designs of Lord Grimthorpe, and be made and fixed by Messrs. W. Potts and Son, clock manufacturers, Leeds and Newcastle-on-Tyne, makers of the church clocks in the adjoining church towers of Askrigg, Weusley, Leyburn, and Middleham.

THE most important of the Roman relics discovered at Brough, near Hope, have been received by the Buxton town authority, and placed in the museum at the town-hall. They include Roman altars, a circular trough, and a slab with inscriptions. The Roman milestone discovered some years ago at Buxton, which has been in the possession of the museum authorities at Derby, has been handed over to the place from which it originated, and was received at the Buxton Town Hall last Friday.

THE Y.M.C.A. Institute at Lanark, which has just been erected at a cost of over £2,000, was formally opened on Friday.

IN compliance with a strong expressional feeling of the City Council of Liverpool at their last meeting, the recommendation of the Finance Committee that Mr. T. Stirling Lee be engaged to execute twelve figures above the panels on the front side of St. George's Hall, being part of the scheme of sculpture for the completion of the building, was withdrawn.

George Spiers Kenneth, architect, Glasgow, died in Glasgow Infirmary, on Sunday, from injuries received in the railway accident at St. Enoch Station in July last. Mr. Kenneth was only 29 years of age.

STATUES, MEMORIALS, &c.

QUEEN VICTORIA MEMORIAL.—Some 300 excavators are now at work on the southern side of the Mall and the ornamental lake in St. James's Park. The contractors have been staking-out the ground from the drawings of the surveyors of H.M. Office of Works. The work, for which Mr. Aston Webb, R.A., is the architect, is of an extensive character, including the construction of new roadways, the diversion of present thoroughfares, the damming of three-quarters of an acre of the lake, tree-cutting, and elevating the level of the lake-bed to that of the Mall (about 40ft.). The monument of Queen Victoria, designed by Mr. Brock, R.A., will be erected in the centre of the segment of a circle, now indicated by a wooden post distant about sixty yards from the central gateway of Buckingham Palace, and around it will be grouped allegorical figures representing the extent and power of the empire. Three new avenues will sweep from the Mall, at a point near Stafford House, by the memorial, one leading to Constitution Hill, a second into the grand thoroughfare in front of the Palace, and the third curving to the left and striking Birdcage-walk at right angles near the guard-room of Wellington Barracks. In place of the old pathway round the lake there will be a colonnade of Portland stone with suitable sculptures, the first block having been already erected.

LEEDS.—The scheme for the adorning of the City-square with statuary is now fast approaching completion. The bronze equestrian statue of the Black Prince, by Mr. T. Brock, R.A., is being placed in position. Round this central figure—the gift of Colonel Harding—are already grouped other and smaller bronze statues of John Harrison, a Leeds benefactor of the 16th century; Dean Hook, the great vicar of Leeds; Joseph Priestley, the discoverer of oxygen, who at one time was the pastor of Mill-hill Unitarian Chapel, close by the Square; and James Watt, the inventor of the modern condensing steam engine. The statue of Priestley is by Mr. Alfred Drury, and those of John Harrison and James Watt by Mr. H. C. Fehr, whilst that of the Dean of Chichester is the work of Mr. F. W. Pomeroy. In addition there are four pairs of nude female figures in bronze, by Mr. Drury, representing "Night" and "Morning." These serve as electric light standards, and there are also large lamps rising from figured bases in bronze representing groups of children.

WORCESTER: SOUTH AFRICAN WAR MEMORIAL.—A meeting of the committee entrusted with the provision of a memorial in honour of Worcester-shire men who fell in the South African war was held on Saturday at the Shire Hall, Worcester, the Earl of Coventry presiding. The question of the form of memorial was placed before the committee on the report of a special sub-committee that Mr. Thomas Brock, R.A., was unable to undertake the design and execution of a memorial, and suggested that he should be entrusted with the provision of a replica of his Ayr memorial. The Mayor of Worcester wrote urging that the memorial should be of original design. Viscount Cobham sympathised with this view, and proposed that original designs be invited from sculptors. He was opposed to a replica, and he thought the design in this case was not suitable for the proposed site in the cathedral churchyard. The resolution was seconded and carried. Lord Coventry and Lord Hampton were also authorised to interview Mr. Coulton, who was recommended by Mr. Brock to be entrusted with an original design. It was reported that £1,300 would be available when all expenses were paid.

APART from the baths in connection with some of the Board schools, there are at present in Bradford only two swimming-baths—those at Manchester-road and Thornton-road. Other baths at Morley-street and Drummond-road are, however, in course of erection, and a Local Government Board inquiry was held at the Bradford Town Hall on Friday, before Colonel W. L. Cole, for the purpose of receiving sanction to borrow £22,500 for the erection of three district baths. It is proposed to erect these, one near Bowling Church in Wakefield-road, to cost £7,911; another in Leeds-road near to Holy Trinity Church, on which £7,796 will be expended; and a third in a corner of Peel Park, at an estimated outlay of £8,362.

AT a meeting of the finance committee of the Newcastle-on-Tyne Corporation on Monday, it was reported that the total amount paid for tramway construction was £962,000. Of this sum, £87,000 had been borrowed. Application was being made to the Local Government Board for power to borrow an additional £128,000 for tramway purposes and street improvements. The town clerk was instructed to press this matter forward, that the amount required may be obtained.

AT Springfontein Station, South Africa, £20,000 is being spent in improving the accommodation, the work including the lengthening of the platform, the erection of a new goods shed, and the provision of offices.

THE thirty-third autumn exhibition at the Walker's Art Gallery, Liverpool, opened this week, includes over 1,200 paintings and drawings, besides miniatures, examples of sculpture, and work in black and white. Portraits predominate this year, the chief exhibitors in this branch being Sargent, Herkomer, Watts, Oulless, Reid, Fildes, and Lavery. The Hon. John Collier shows his "Prodigal Daughter," a feature of the recent Academy, and among other *genre* works are Stanhope Forbes's "Nomads," Clansen's "Hay-makers," Boughton's "Imogene," and J. W. Waterhouse's "Echo and Narcissus." Poynter and Alma Tadema are also represented by recent works. Among the landscapes are examples of work by Parsons, Murray, La Thangue, and an interesting canvas by G. F. Watts, as well as several by the modern Dutch school, including Israels, Manve, and Maris.

THE autumn exhibition at the Manchester City Art Gallery, which opened on Monday, is not equal to some former displays, and the pictures are manifestly cramped for space in the present building. The chief attractions are Sir E. J. Poynter's "Cave of the Storm Nymphs" and Edwin Abbey's "Crusaders Sighting Jerusalem." Other works of interest are Sir W. B. Richmond's "Phaeton Sunrise," Sir E. A. Waterlow's "Warkworth Castle," Alfred East's "Château Gaillard," and J. C. Dollman's clever illustration of Kipling's story of the boy elected king of the monkeys, and Sir Wyke-Bailliss's "Louvain Cathedral." Among the landscapes those by Clarence White, Coutts Mitche, A. Roche, D. T. Cameron, Joseph Farquhar, and Adrian Stokes deserve a passing line, while portraiture is well represented by the works of Charles Furse, Ralph Peacock, G. H. Boughton, and Monat Loudan.

In a letter to the *Standard*, Mr. Harry Hems corrects the error into which Mr. A. J. Waterfield had fallen in a previous communication to that journal in supposing the grand series of groups (40 in number) illustrating the life of the Blessed Virgin, that run continuously around the screen inclosing the choir of this superb cathedral from its aisles, are actually carved "point lace like in stone." "This," Mr. Hems explains, "is not a fact. The first one (at the west end of the south aisle) represents a group of shepherds, with bagpipes and attendant goats, and the story ultimately finishes with the Virgin, after death, crowned as Queen of Heaven. Thus the whole life of our Lord, from his mysterious incarnation to his death and resurrection, is incorporated therein. Every figure (although, like so many French ones, short in stature) is powerfully conceived, but—and of this few are aware—so far from being part and parcel of the fabric, these groups are simply plaster of Paris casts of the sculptor's original clay models. The actual work in stone has never yet been carried out. It must be fully forty years ago that, when examining them from the top of high trestles, I made this discovery. It is also not generally known that when, many years ago, the west front, with its great rose window between the towers, got somewhat out of perpendicular, and thus suggested possible danger, a French engineer got it upright again by a clever expedient. Long iron bars were made to connect the masonry of the front to portions of the inner roof. These rods were continually heated red hot in places, and then allowed to cool. Thus the natural shrinkage of the metal materially lessened its length, and the wall was pulled up again plumb."

A CONTEMPORARY summary of the clauses of the notorious Window Tax, introduced just a century ago, is given by the *Leeds Mercury*, as one of a series of extracts from the early issues of that journal. The following excerpt, dated Sept. 3, 1803, is suggestive, as showing how restrictive on enterprise and injurious to health this ill-judged impost was in its practical operation. "According to new rules for charging the window duties, skylights, cellar lights, staircase or passage lights are all to be included. Whether the kitchen, cellar, washhouse, brewhouse, &c., shall be within the dwelling, contiguous to or disjoined from the same, shall be equally liable as if a part of the house. When a division between two or more windows is more than 12in. broad, the light on each side shall be charged as a separate window. Window giving light to more than one room or landing-place shall be

charged as so many distinct windows as the number of places it gives light to. All windows exceeding 1ft. high or 1ft. 6in. broad, including the whole opening of the wall in which the window is fixed, shall be charged as two windows, unless built prior to April 5, 1785; excepting also the windows of shops, workshops, or warehouses, and those belonging to places of public entertainment, licensed to sell wine or other liquors, and excepting farmhouses."

THE new session of the Birmingham Central Municipal School of Art will begin on Monday next the 14th inst., when the newly-appointed headmaster, Mr. R. Catterson-Smith, who has succeeded Mr. Edward K. Taylor, will commence his duties. Interesting syllabi have been prepared by Messrs. W. H. Bidlake, M.A., A.R.I.B.A., C. E. Bateman, F.R.I.B.A., Herbert T. Buckland, and others in connection with the classes in architectural history, architectural design, taking builders' quantities, building construction, and geometry. The main object of the school is to make artisans better workmen. Whilst fulfilling that object, every facility is provided for students who wish to learn drawing, painting, or modelling, solely on educational grounds, for teachers in schools, and for students who possess an aptitude for a craft and wish to develop it.

THE prospectus of the City of Liverpool School of Architecture and Applied Art for the session 1903-4 shows that the school now consists of—(1) Architectural studio, (2) sculpture and modelling studio, (3) drawing and painting studio, (4) decorative design, stained glass, and enamelling studios, (5) metal-working workshop, and (6) woodcarving workshop. Both day and evening classes are held, the objects being—(1) To effect a complete union between the different arts and crafts, (2) to establish a thorough course of training for students in the different arts, especially in architecture, sculpture, and decorative design, and (3) to provide special instruction of an advanced kind for skilled craftsmen and artisans, chiefly in those crafts allied to architecture.

THE Ecclesiastical, Educational, and Art Exhibition will celebrate at Bristol its "silver" anniversary, the first being at Swansea in 1879. Mr. Hart's 25th exhibition will be held at the Rifle Drill Hall, Queen's-road, Bristol, concurrently with the Church Congress. The loan collection will be one of the best that has been seen for some years. Besides the Bishop and the Lord Mayor, Mr. Hart has secured on the committee for this section the Duke of Beaufort, the Dean of Bristol, Sir John Dickson-Poynder, M.P., Colonel T. W. Chester-Master, and the Rev. H. R. Wilkins, hon. secretary. Among the promised exhibitors are the Bishop, the Dean and Chapter, and the Lord Mayor and Corporation—the latter sending not only the valuable plate of which they are the custodians, but also some of their city's ancient records.

AN exhibition of Building Improvements and Decorative Art is to be held in the Aquarium at Brighton, now the property of the corporation of that borough, from Wednesday, the 23rd inst. until October 10. The committee propose to organise an exhibition of all novel and attractive patents in the building world, giving due prominence to artistic, decorative, and modern improvements, rather than to ordinary and staple articles of utility long since recognised. At the same time exhibits of historical interest and those illustrative of the progress of British architecture will be welcomed. The exhibits will include decorative metal-work; art wall decorations and enrichments; the best appliances for lighting, sanitation, ventilation, and fireproof construction; mechanically ornamented woodwork; improvements in glazing and roofing. Artistic household fixtures and fittings will receive special attention. The corporation of Brighton have recently applied to the Local Government Board for permission to expend a considerable sum in enlarging the Aquarium itself, and several large building contracts have recently been placed, and others are shortly to be tendered for in the town; important public works are also in course of arrangement at Worthing, Hove, Shoreham, and other closely neighbouring towns. The exhibition, therefore, is being held at a period peculiarly suitable for the prominent display of all that is valuable in modern building design, construction, and decoration. The Aquarium Committee, having decided to introduce a new heating system in the buildings, offer a special prize of 20 guineas for the best proposal, to be accompanied by plans and

estimates, with or without illustrative working models, the cost not to exceed £600. The organising manager is Mr. Ed. S. Michel, Grand Aquarium, Brighton.

COUNCILLOR JAMES HIGSON, J.P., of Salford, has been nominated by the council of the National Association of Master House Painters and Decorators of England and Wales (Incorporated) for the position of President for 1903-4, and it is probable that the convention next year will be held at Manchester. It will be then exactly ten years since the association visited the city, the last occasion being at the time of its inauguration in 1894. It will come to Manchester next year a strong and representative body, as its constituents cover the whole of England and Wales. Amongst its five life members are Mr. Walter Crane and Mr. George Haire, two are American citizens, and one an eminent Scotch decorator. The tenth annual convention meets at Nottingham on the 21st inst., and Lord Henry Bentinck, M.P., is to open the proceedings.

TENSILE tests of wrought-iron bars, showing the effect of overstraining followed by intervals of rest, were made at the Watertown Arsenal upon four kinds of wrought iron: Common, refined, best puddled, Burden's best, and Norway. One test on each kind was made in the ordinary manner. With the other specimens an overstraining load was applied, ranging from 25,000 to 45,000lb. per square inch, followed by an interval of no load, after which the loading was resumed until rupture was reached. The gain in the elastic limit produced by the overstraining loads was well shown throughout the series, and ranged from 2,000 to 6,000lb. per square inch. It was also apparently shown, although these effects are not so well marked, that the greater the magnitude of the overstraining load and the longer the interval of rest between the two loadings, the greater was the gain in the elastic limit. No effect of the overstraining load upon the contraction of area was apparent.

ON September 1, on the Nottingham Forest Football Club's ground, a fire test of "Uralite" was carried out in the presence of a large number of architects, builders, corporation officials, the fire brigade, and other gentlemen. A screen was erected consisting of ordinary timber covered with "Uralite," and against this a huge bonfire was lighted made of timber soaked in petroleum. In the middle of the bonfire a deed-box was placed, constructed of timber covered with "Uralite," and inside the box were placed a quantity of papers, sulphur, paraffin-wax, and fusible metal. After the fire had burned itself out the box was opened (the temperature to which it had been subject was at times as high as 1,800° Fahr.), and it was found that the contents were uninjured, and the inside of the box was not even warm to the hand. The back of the screen never reached more than a few degrees above the normal temperature of the atmosphere. All present expressed themselves pleased with the results of the test. The material has already been adopted by 100 different trades for a great variety of purposes, notably in connection with electric railway carriages for covering the underside as a protection against fire caused by short circuits, for railway panels, for roofs of all kinds of buildings, for ceilings, partitions, and doors in factories and workshops. Messrs. H. Hopkinson, Ltd., iron, steel, and metal merchants, of Station-street, Nottingham, are the agents for the city and county of Nottingham, and were represented on the field by Mr. Hopkinson and his sons. The representatives of the British Uralite Co. present were Mr. Armstrong, commercial manager, Mr. Watson, works manager, and Mr. Smith, assistant City manager.

A COLOSSAL Calvary of oak, which formerly stood on the coast near Du Conquet, Finisterre, and has for many years past been a prominent feature in the garden of Mr. Harry Hems, in Fair Park, Longbrook-street, Exeter, has been set up in the highest part of the Abbey garden at the Benedictine Monastery, Erdington, near Birmingham. It is about 10ft. in height, the figure of Our Saviour being over 8ft. high. The crucifix has evoked some criticism and hostility on the part of ultra-Protestants at Erdington, who, apparently, cannot accord to their neighbours that liberty of conscience they claim for themselves, and to allay local feeling the Fathers have planted the site round with trees, which will, ere long, partially screen this massive and excellent example of the 16th-century art of Brittany.

THE City Corporation will shortly offer for

annual competition among the members of the private fire brigades of the Metropolis a handsome challenge shield, the members of the winning team receiving medals. The majority of the great firms in London possess their own fire brigades, and in the City some excellent work has been from time to time performed by these amateur firemen. For the purpose of encouraging the movement the Corporation has contributed the challenge shield, which bears on the top the arms of the City of London, flanked by firemen's helmets, and encircled by laurels, while the centre-piece illustrates firemen at work. The shield is surrounded by a number of tablets, upon which will be inscribed from time to time the names of the winning teams. On the reassembling of the Court of Common Council arrangements will be made for the competition.

The city council of Manchester have, by a unanimous vote, authorised the tramways committee to act under the provisions of the Manchester Southern Tramways Act, 1903, so far as they affect the corporation, and to take such action and enter into such arrangements as they may deem advisable. In the last session of Parliament the Manchester Southern Tramways Bill, which was supported by the corporation, after being passed, became practically the Act of the corporation. It provides that tramways are to be constructed from Barton Bridge, along Crofts Bank-road, by Davyhulme and Urnston, to Stretford, along School-road and Northenden-road, Sale, past the Industrial Schools, and on through Northenden, and to connect with the tramways of the Stockport Corporation at Gatley. In that way there will be formed a complete ring of tramways round the city on its southern side. There is also to be an extension along the main road from the Old Cock Inn, Stretford, to the boundary of Altrincham, with which town Manchester will enjoy through communication, under an arrangement to be concluded with the Altrincham District Council. Manchester will thus be provided with tramway connections along all the main roads with the surrounding towns. From Northenden there will be connections with Stockport, Denton, and Ashton. Manchester is already connected with Middleton, and they have made overtures to the Oldham Corporation for the running of through cars to that town.

THE ARCHITECTURAL ASSOCIATION.

COURSES OF INSTRUCTION IN ARCHITECTURE.
The Day School will open on MONDAY, September 22nd, at 9.45 a.m. Intending pupils are requested to forward their names to the Secretary as early as possible.
The Evening School also opens on the same date at 6.30 p.m.
A pamphlet containing full information as to the Classes and advantages of membership may be obtained upon application to the Secretary, at 55, Great Marlborough Street, London, W.
H. P. G. MATELLE, Secy.
H. TANNER, Jun., Hon. Secs.

The Society of Architects.

Founded 1884. Incorporated 1893.

The next ENTRANCE EXAMINATION will be held in LONDON and certain PROVINCIAL CENTRES on OCTOBER 6th, 7th, and 8th, 1903. Syllabus post free, or on application to the SECRETARY of the Society of Architects, St. James's Hall, Piccadilly, London, W.

The will of Mr. Killingworth Richard Hedges, of 51, Montagu-square, who died on July 10, was proved on August 21, by Assheton Pownall, Alexander Martin Bremner, Herbert Alexander Wix, and Charles Bourne-Royds, the executors, the value of the estate being £34,156.

A prehistoric British barrow was opened at Martinstown, Dorset, on Wednesday, under the supervision of Mr. St. George Gray, curator of the Taunton Museum. There were disclosed worked flints and several interments. In the centre of the barrow was found a large British urn inverted on a slab of stone, covering some cremated remains which had been wrapped in a rough material of cloth or rushes, the texture of the weaving being still traceable. A quantity of other pottery was also unearthed. In another barrow close by have been found a vase and a bronze knife with a portion of a willow handle.

At the last meeting of the Public Libraries Committee of the Barry Urban District Council, a letter was read from Mr. Andrew Carnegie declining to contribute an additional amount towards the cost of the proposed central library and reading-room at Barry. The committee had a consultation with Messrs. Hutchinsons and Payne, of London, the architects, and reductions in the estimates were decided upon in order to bring the cost of the building within the amount of £8,000, which Mr. Carnegie has given.

Trade News.

WAGES MOVEMENTS.

BURSLER.—Messrs. Doulton, Ltd., have given notice to the sanitary potters at their Burslem works to terminate their contracts, with a view to a reduction in the prices paid for certain articles. The operatives have given a counter notice asking for an increase in the prices paid for some other articles. Messrs. Doulton offered to submit the whole matter to arbitration, but the operatives have passed a resolution not to submit to any reduction, and not to accept arbitration.

LIMERICK.—A dispute among bricklayers and masons has resulted in a lockout in Limerick. The cessation of work means a loss of £300 per week to the working men of that city. The quarrel had its origin in the refusal of the masons to work with bricklayers from Belfast who were employed by Messrs. Ryan and Son, when the Guild of Masons failed to provide the number of men which they undertook to secure for the employers, who are contractors for the building of a new Post-office and a training college for girls in that city. The guild agreed that Messrs. Ryan should advertise for "brickmen," but when the men arrived they did not work, as the masons held that they had given permission to employ outside "brick and stone men," a distinction which, it is said, is not understood outside of Limerick.

SUNDERLAND.—The Sunderland joiners have held a mass meeting in the Villiers-street Institute for the purpose of considering the dispute which at present exists between the house joiners and the masters. Nearly three months ago the men came out on strike for an increase of 3d. per hour, which would bring the rate up to 10s. per hour. Attempts to effect a settlement failed, the men refusing to accept the suggestion of his worship the mayor. The last proposal of his worship was that an arbitrator should be appointed; but on a ballot the men refused to accept this by a majority of over 100. The masters then decided upon a lock-out over the area of the Northern Counties federation, but agreed, at the request of the men's representatives, to postpone the lock-out for a fortnight, in order that a ballot of the men might be taken on the question of arbitration. At a meeting on Friday, which was largely attended by both shipyard and house joiners, this ballot was taken, and it was agreed by a small majority to submit to arbitration. The men also decided not to resume work until the award is made known.

The work of widening London Bridge is being pushed forward rapidly. Much of the new granite balustraded parapet is fixed in position, and it is hoped that all will be completed by March next. The contractors, Messrs. Pethick and Brothers, are asking for tenders for the purchase of the temporary footbridges.

LIST OF COMPETITIONS OPEN.

FRIDAY, SEPTEMBER 18, 1903.

ACOUSTICS.

ALL attempts to explain the laws which should govern the planning and arrangement of buildings that are favourable to sound are of little value if based on only one of the conditions, such as certain proportions of plan and height, though these may much facilitate the propagation of the waves of sound. Theories unfortunately help architects very little on questions which depend on so many factors, such as the purpose of the building, the materials of which it is composed, their resonant qualities, the currents of air in the building as determined by the mode of ventilation, the smoothness or roughness of the walls, the kind of roof or ceiling, and the obstacles in the way of the propagation of the waves of sound. Yet these are all manageable ones; they can all be determined by experiment, and we can find out much about them. For example, the resonant properties of stone, brick, glass, wood of various kinds, iron, plaster, drapery, and other substances can and have been determined, and we have only to apply the conclusions to the particular building. In short there are no two buildings that can be properly judged acoustically on the same basis when their materials vary considerably. Their walls are of different materials and thickness; one may be plastered, the other panelled with wood. The roof or ceiling in each case may have differing degrees of resonance, be of different form, one have timber principals, the other perfectly smooth plaster with slight moulded ribs, or one be coffered with a flat ceiling, the other arched or deeply coved; the sittings and fittings of each may also vary. Apart from structural differences, the currents of air in each hall or room may be in different directions, all of which things considerably modify sound. As one writer on the subject has said, it seems strange in an age of specialised knowledge that there should not be certain definite data as to what constitutes a bad or a good hall, or to what its defective qualities are to be attributed, and that the architect should not be able to determine in advance what will insure good acoustic properties. "As a matter of fact, however," he points out, "there is no department of applied science to-day in which the available knowledge is so deficient as in acoustics." But the architect has to grope his way in the dark; he has to take the few strands of knowledge which experiment has left, and try to find out for himself the qualities and points which are most favourable to his purpose. Definite data from certain conditions ought to be within his reach, but these cannot be deduced from a limited experience. Thus it would not be prudent to depend in every case upon a certain shape of ceiling, though in one case we knew the acoustics were good. And it has been found the same in the shape and proportions of a hall. The same plan and dimensions which have produced good results in one building have not been found successful in a second situated on another site, so that we cannot arrive at any scientific deduction by taking the result in one or two cases, and imagine that by applying the same data to another building we shall be sure of success. Certain results derived from personal experience are nevertheless of value if they can be properly attested—that is to say, if the observers are careful in every instance to record the exact

conditions of the building, its materials, plan, and structure and fittings in detail.

We are not now discussing the subject systematically, but only endeavouring to point out a few of the opinions that have been advanced. More has been accomplished in the way of experiment in America than with us. The symphony halls which have been erected of late years in New York, Boston, and other cities of the West, have directed attention to the acoustical properties of such buildings. At Boston, the lately-erected Symphony Hall is one of the first buildings erected in America, at least, where scientific planning was attempted. Before that time the design of these buildings was largely a matter of mere guesswork. It has been asserted that long before the walls of that building were up, it was known with accuracy what the acoustic properties of the auditorium were to be. The confidence thus felt was, it is stated, due to the investigations of an eminent physicist of Harvard University, Mr. Wallace C. Sabine, assistant professor of physics, who had been studying the subject for many years. He had been asked to find a remedy for the acoustic defects of a lecture-room, which led him into a thorough investigation of the question. His examinations at least have set aside as worthless the popular notions about certain proportions that had previously been held, and the theories of authors. There was, as we have said, an idea that if one building acoustically perfect was copied in its general plan and arrangement in another, the second would be also successful; but Professor Sabine shows that this is a fallacy: it can only be exactly duplicated if the conditions holding in the model are also followed in the materials used, the wall structure, the proportion, arrangement of fittings, ventilation, &c. It has been shown, indeed, by recent experimentalists that not one of the conditions or details can be varied without varying the results; but that it is possible to calculate the effect of these variations so that the architect can, by study, find out beforehand what such and such change will do, and thus by compensating variations preserve the acoustical properties of his auditorium, or of any auditorium he may have taken as a model. In short, recent experiment and investigations have established by means of certain values attached to certain materials and conditions of structure, as that of absorption of sound created by such things as drapery and cushions of the seats; that it is possible scientifically to reproduce the same effects by making compensatory variations in the planning or structural conditions. The music hall we have mentioned was planned on these principles. The architects, McKim, Mead, and White, of New York, visited Europe and consulted the scientific authorities of France and Germany; the Greek plan of theatre was thought too bold an experiment for a music hall, and the well-known auditorium in Leipsic (the Gewandhaus) was too small in capacity to be selected as a model. The Boston hall, its stage recess, sloping floor, and tiers of galleries, with its increased seating capacity, is said to be a copy of the old hall only in certain acoustical results, and not in the architectural means by which these results were attained. The new hall contains about 175,000 cubic feet more than the German one, yet it is stated that, owing to skilful calculation and careful balancing, the reverberation of the former, as expressed in the formulas prepared at Harvard, is 2.31 against 2.30 in the Leipsic hall. How has this result been accomplished? The researches at the Harvard University have embraced all the conditions and details of buildings likely to influence the acoustics. The most minute investigations have been made to ascertain the variations of different halls or rooms. For example, the acoustic effects of a room of certain size and shape, for

an audience of a certain number, has been compared with another of equal size but crowded with people. Then a small room has been compared with a larger one of like form and fittings filled with an audience. But these comparisons have gone further; the question of the effect of certain bodies and substances in absorbing sound—a very important factor in determining the sound-conveying properties of a room—has been studied, and the results tabulated. Various objects, it is well known, absorb or deaden sound more or less; thus we all know how a crowd of people in a room will appreciably deaden the sound of music, or the voice compared with an empty room, or one occupied only by a few persons. The audience, in short, becomes a very potent absorber of the sound. A number of women will absorb sound to a greater extent than men, because of their dress, and, in fact, each individual has its own value which can be determined by experiment. Then again, upholstery, carpets, curtains, and drapery in a room have a very decided effect in absorbing or deadening sound, and it is possible to put a value to each of those materials, like cushioned seats, a carpeted floor, and draped walls. A room which suffers from confused sounds or reverberation, as it is called, is often remedied by the use of any of these substances. We may here refer to a few examples of the use of absorbents in preventing reverberation or echo. Many of our public halls and public edifices are spoiled by reverberation, which renders them, even when filled by people, defective for musical and other performances. In such rooms the voice resounds, and is audible for several seconds after it emanates from the speaker, producing a confused noise very distressing to the audience. Listening to a speaker or vocalist becomes wearisome. In the case of a lecture-room in New York, this defect was remedied by placing in it a large number of cushions, and exposing their larger surfaces to the sound, by which it is stated the reverberation was reduced to about a fifth of what it had been. They acted as absorbents of the undesirable reverberation. We all know, too, what a difference it makes to the sound of a room when a carpet is laid down. Before, the voice of a person or the tread of feet makes a noisy reverberating sound; after the floor is covered the sound is clear. Even curtains hung in a room have remedied the excessive reverberation, and rendered the acoustic qualities tolerable. Then there are other kinds of absorbing materials. There is, for instance, glass, which is a large factor in the construction of halls and concert-rooms. If we take the open window as representing the unit, the absorption of glass is expressed by the fraction .025, a very small quantity. Pine boarding is expressed by .061, a rather larger fraction. A settee upholstered in hair and leather has a value of 1.10; while a settee of ash has a value of .039. These values or comparisons of absorption are of great use, as they enable the architect to rectify any excess or defect of the reverberating qualities of his structure. The open window is thus taken as the unit, because, as it is stated, "it makes no difference whether the sound escapes into the open air or is transformed into heat in some substance," and an equal area of any other material is compared with this unit as a standard. One writer says: "More curious are the figures for persons or for an audience *en masse*. A woman absorbs more than a man for the reason that her dress offers a greater surface. For the same reason a person sitting in a scattered audience absorbs more than he would if he were one of a crowded audience. An audience is reckoned as a bounding surface, like a floor. In these calculations, and its area measured in metres." A table of comparative values gives for an audience per metre .96, for an audience per person .44; isolated woman .54,

isolated man '48. It is sufficient here to give these few instances of the effect and values of absorbing surfaces, as they show how large a part they play in the acoustical result. A certain amount of resonance is desirable in hall or lecture-room. A hall without it is neither good for music nor the voice, and it is this particular quantity that it is desirable to retain. For musical performances the exact proportion of resonance to the other quality of deadness or absorption is considered more necessary than for the voice, as the tones of music are purer in quality, and more susceptible to interference: but one writer says "investigation has failed to discover a hall thoroughly satisfactory for music which was not equally good for the voice." The same writer, Mr. C. H. Blackall, in the *Technograph* of the Illinois University, says:—"Another popular fancy is that every structure has its exact note in a musical scale. . . . Personally, I do not believe it. Nor can I find that a hall has an individual pitch to which a speaker must accord his voice. It would be a poor hall indeed in which a speaker would be at his best in only one pitch, and such halls practically do not exist." We are not discussing theories here, nor do we express our views on the above opinion; but it has been almost proved by authorities on the science that every building or room has its particular "note," which depends largely on the materials of which it is composed, just as every violin or instrument has a note of its own.

Practically, the best proportions of a hall, or its relative length, breadth, and height, are questions which the architect desires to find out. Authorities differ much as to these dimensions. One author says, a perfect hall for music should be as 2 to 3 to 5; another as 1 to 1 to 2, but one may dismiss these theories as mere guesses. The author we last quoted refers to the well-known Leipsic hall we have noticed, and also to the Steinert Hall in Boston, in which the auditorium is about 60 per cent. longer than the width, and the width increases towards the rear, the side walls not being parallel, as being one of the best places for chamber music; but he mentions another hall in the same city which is much broader than it is long, but which is deficient in the quality and volume of the music. The hall of Tremont Temple in Boston is a rectangle 120ft. long and 70ft. wide, and its acoustical qualities for both vocal and instrumental music are said to be perfect. Thus these examples point to an elongated plan; but the author thinks a better plan, considering both the acoustics and the lines of sight, is a square auditorium which limits the width to 90ft., as beyond that width the extreme sides are apt to suffer. We have here a great variety of American opinion as to plan. One set of authorities advocate elongated rectangles; other writers a square or rectangular auditorium of greater width than length; a third set advocate a trumpet-shaped building, diverging outwards from the orchestra. The theory of the conduction or propagation of sound appears to favour the last idea; but it is practically a dead letter, as this type of hall requires the side walls to diverge or bevel outwards, and the ceiling to follow the same lines, while the floor must be raised at the back of hall. We have seen designs for concert-halls based on this theory, and a few years ago certain designs sent in for a hall of this description for one of ten Institute prizes were planned with the lines of walls and roof arranged on this principle.

The author we have mentioned says a "rectangular auditorium—whether concert-hall or theatre—should not have a rectangular proscenium. In theatres which are good acoustically, it is found that the walls immediately preceding the opening proscenium are built at a slight bevel outwards, and the ceiling over the fronts of these boxes and

connecting the two sides is slightly arched on the bevel corresponding to the angle of the sides," and he instances the Auditorium Theatre of Chicago, which is a great success. In this building "the bevelled walls on each side of the proscenium are carried out into the auditorium, and there appears reasonable ground for the theory that the sound issuing from the stage is in a measure directed and equalised towards the audience." There is little doubt this bevelling of the walls and ceiling outward from the stage is conducive to the proper conduction of the sound, and it is asserted that in nearly all theatres which are acoustically successful this arrangement has been followed. We may again quote Mr. Blackall: "In my judgment it is essential that the main ceiling of any auditorium should be slightly varied in level—that is to say, not one unbroken surface—and with a sufficient number of distinct breaks, either by beams, ribs, or some other architectural device, so that any sound-waves which might be supposed to impinge on the ceiling would be scattered and dispersed rather than reflected to the audience. Any arrangement of domed surfaces, however, implies a certain risk. There are very few instances which have come under my observation of domed auditoriums which were wholly successful acoustically, while there are a number of instances in which a dome was presumably the cause of poor acoustic properties. The Paris Opera House is one striking instance." The same writer does not think the form of balconies and galleries have any relation to the acoustic qualities of a house, nor that a wide "overhang" with "pockets" under the galleries is necessarily bad; and he says that Tremont Temple, which has a very deep pocket under the gallery, is faultless in this respect. But deep overhanging balconies may create awkward sight-lines and other inconveniences. The author, as we have seen, advocates well-broken ceilings, but thinks the walls are better unbroken. In the new Boston Symphony Hall the side walls are broken by pilasters and deep niches, and these breaks he thinks have not aided sound. Sanders' theatre in Harvard University has a broken ceiling and plain walls, and successful theatres show the same treatment. A slight cove between the wall and ceiling improves the effect, and certainly the appearance, but a large cove, unless well broken up in its horizontal dimension, is a source of trouble. So the author concludes: "So, then, the ideal auditorium would seem to be one with a very elaborate ceiling, rather simple walls, a width of perhaps 80ft. or 90ft., and a depth of perhaps 100ft. or 115ft., with projecting proscenium walls set at an angle to the centre line, and an arched ceiling overhead. I do not know of a single theatre which follows these lines in which bad acoustic properties have developed." The type of building or hall thus indicated appears to have common sense in its favour. Most of our old and modern churches are based on this type and proportion, except that the walls of chancel, which may be regarded as a sort of proscenium, are not bevelled. There is an exception to this in one or two modern churches where the architect has bevelled the eastern bay of his arcades and clerestory towards the chancel arch, and has at the same time reduced the height of his nave vault over this portion. The late Mr. Street, in the church of St. John the Divine, Kennington, has carried out this bevelling of the nave walls at the chancel end with undoubted success to the acoustics, and the apsidal-ended chancel also aids the effect. One of the designs submitted for Liverpool Cathedral adopted in a marked manner the same plan of converging the lines of nave to the narrowed chancel or choir. The result in both these instances is to give a wider nave for congregational use than would otherwise be practicable. Mr. J. Cubitt, in several of his executed Congregational churches, has shown a similar mode of

construction, which has proved satisfactory. The bevelled or splayed walls of a chancel or hall recess need not be built as solid as the walls, but may be so formed by partitions inside, which would give greater resonance.

Other details may be noticed, but of these we may speak in another article. The height of a platform for a concert-hall has a considerable influence in confining the body of sound, just in the same way as the lowered ceiling; but musicians differ in opinion. At the Steinert Hall, Boston, intended for piano recitals, it was thought the best results would be obtained by placing the piano on the floor; but on the score of sight a raised platform is desirable. The question of materials used in construction cannot be discussed here. As we have said, the science of acoustics has reached a more practical stage, and the architects of our concert-halls, lecture-rooms, and theatres have to consider many other things besides plan and proportion, and to adopt materials and finishings that will assist rather than destroy the results of good planning; they have to take into account the resonant as well as absorbent qualities of the materials they use and their mode of finish, and to calculate beforehand the proportion of audience and the values attached to upholstered seats and accessories.

BUILDING AT BRIGHTON.

LIKE many seaside towns which have outgrown their primitive and mixed character as fishing villages and quiet resorts, Brighton has lost much of its earlier attractiveness to the visitor, and is yearly assuming the position of a large and populous town near the sea, full of fine shops, and made to look as much like London as possible. With the very increase of its area and population, the elements which contributed to its position as the "Queen of English Watering Places" are gradually disappearing, for whatever aids in the promotion of the seaside resort and gives it its distinct character and charm is positively hostile to those signs of town growth. The great seaside town of Sussex is an illustration. Northwards, eastwards, and westwards, wherever the eye travels, it is enlarging its boundaries to an extent which would have defied expectation only a decade or two ago. What seemed impassable barriers to its growth in a northerly direction—the hilly downs—have yielded to the encroachments of the speculative builder. Visitors to the Southern watering-place, as they pass Preston, will find steep hills entirely covered with serried lines of brick and slate. These rows of new houses climb up the inclines by a succession of steps, till now very little of the grass slopes are visible: they appear incrustated with a covering of stucco and slates, which is certainly not agreeable to the artistic sense. The rural charm of the green hillside has disappeared, and a dark coating of human habitations has taken its place. The streets are laid out in long straight lines from north to south, many of them of considerable steepness; these are intersected by other straight streets of houses, which fall rapidly on either side. From The Level—now a public recreation ground—three main roads diverge: the Ditchling-road, Lewes-road, and Elm-grove. Two of these are exceedingly steep, and are traversed by lines of tramways. The facilities afforded by the corporation for rendering these northern heights of the town accessible by means of the splendid service of electric trams have been the means of rapidly developing the building estates, and, really, of indirectly spoiling the scenery of the Downs. And what is the class of building that has been erected? The interminable rows of commonplace red-brick and slated-roof dwellings which are rendering the suburbs of London in every direction so distressingly monotonous and wearisome. The elevations

to the new roads and streets are of the "jerry" builders' style, though here and there a few rows of houses of a better kind are built. In some of these the front of each house consists of a gabled portion containing the main rooms in two or three stories, and the entrance portion recessed a little, with an entrance-door beneath a lean-to roof supported on corbels. In other cases the front door is merely placed in the flat brick wall of the front, surrounded by the pretentious stone pilasters and carved arched head so well known to the London suburban resident, while the same lavish carved stonework embellishes the bay windows, usually carried up two stories. Here and there another variety of elevation is to be seen, in which gables filled with so-called "half-timbering," but which is often cement framework filled in with stucco or roughcast panels, is introduced. The gabled bay window is a common feature: the gable is sometimes half-timbered, and overhangs the bay. A few attempts to produce picturesque fronts are seen, but they are few. These rows of dwelling-houses, or "villas," as they are often called, ascend the hillsides by steps, with a regularity that tries the most ardent believer in straightness, and even makes him wish for a few more cross-roads, or a bend or two in the street, to relieve the dullness of the scene. Why these main roads, which diverge in different directions, should have been planned perfectly straight we are at a loss to understand, when they might have been arranged to follow the contour lines, and thus give a little variety to the roads. The Ditchling, the Lewes, and the Elms-grove roads are all tramway roads, and building has extended in their directions to the very boundary of the Parliamentary borough. These main thoroughfares intersect numerous cross streets, some at right angles, others obliquely. Even in the neighbourhood of the Brighton Cemetery small houses are rising, and round Preston Park a dense new neighbourhood has grown up, as anyone may see who travels by railway, the steep cliffs to the west of which are crested by terraces. The heights above sea-level of some of these roads are considerable. Taking the reduced Ordnance Map published by Bacon and Co., we find the rise of the Ditchling-road at the boundary of the borough as 349ft., while at its commencement near the Level the figure is 87ft. These data show the very steep rise of the roads which have been formed over the Downs in all directions. The local materials—flint and brick—have been pleasingly combined in many instances, the flintwork forming the main surface of wall, with courses and dressings round the window openings of red brick: the result is pleasing. Stucco is also largely used in the town, and many of the new buildings are faced with it. Perhaps in no town in England do we find better cement and stucco fronts, the architectural dressings being all run or moulded in this material. The stuccoed terraces, crescents, and squares from Hove to Kemp Town exhibit the extensive sway which stucco architecture held here during the last century, when Brighton was at the height of its prosperity. In Hove the mania for building is also evident. The Vallance Estate has some nice brick and tiled-roof villas designed in a picturesque style, in which half-timber work, tile-hanging, roughcast, and other features of the Old English timbered style are introduced; but, as usual, there is in many of these houses an effort to produce the picturesque at the sacrifice of more important qualities. The wooden balcony is a feature in many of the houses; but this can be easily overdone. Along the main tramway-road the houses are of the most depressing and commonplace kind.

Very little of a distinctly architectural character has been done of late. Two banks at each corner of North-street may be

noticed. Both are built of Portland stone, with grey granite in the basement story in one instance. The Capital and Counties Bank at the west corner has a fooled grey granite basement with stone above. The windows are mullioned, and there is a corner octagon turret springing from the circular pedimental head of the corner entrance rather boldly. This is crowned by a bell-shaped cupola of stone, but with a not very elegant termination. The London and County Bank at the opposite corner is also of Portland stone, and massively treated in the details. The lower story is the most successful part of the design. The windows are divided by bold rusticated pilasters with alternate blocks or courses of stone and red Mansfield; but it is the way these piers are separated from the windows or accentuated that is worth notice. There is a double break on each side of pilaster—first a narrow, flat face, and then a quarter-round recess on plan, which forms a kind of channel between the window architrave and the pilasters, affording a good shadow round the windows, and serve to break up the front. Above, the façade is less noticeable. Instead of narrow pilasters or architraves on each side of the windows, there is a wide panel of about half the width of opening, carved with an Arabesque ornament in low relief, and the same kind of relief is seen on each side of the main entrance at the corner. A little higher up North-street is another bank, the "London, City, and Midland," at the corner of Bond-street. It is also of stone. The main ground and story has an order of columns (Doric) resting on a stylobate of grey granite. There is a corner granite doorway with pediment, and above is a recessed circular turret crowned by a lead cupola. The turret has two engaged columns, and is well treated in the design.

The recently-built Free Public Library next the Dome is designed in the style of the Pavilion. The entrance-hall is lined with ceramic glazed tiles in shades of light green, with an ornamental dado in dark blue and green, the stairs being separated by an archway of cusped arches of the type seen at the Royal Pavilion, supported on capitals of the same Moorish or Indian style. The news-room on the ground floor is well lighted by large windows facing Church-street. The lending-library is also a spacious room of considerable length, top-lighted by a lantern skylight. Above the news-room is the reference-room, the ceiling of which is panelled with three small cupolas of tinted glass, which give a soft subdued light. The pavilion at the end of the new Palace Pier, (which is about 1,700ft. in length) is a spacious structure of its kind. The auditorium is covered by a bold segmental roof springing from small cantilevers which project over the side passages. It is divided by large and small ribs with longitudinal timbers or purlins, which form deep coffers. These are stencilled, and the scheme of colour—deep red, blue, and green—is effective. Along the crown of roof the coffers form a series of open lights. The hall is well ventilated by exhausts along this level, and the seating is in curved rows, and is inclined from platform of orchestra to the back of hall. The ribs are plain and rectangular in section, but have painted ornaments in the sides and soffits. The cut cusped brackets are also painted. The design and decoration are noticeable chiefly for the employment of a mechanical method, the circular cusps of cantilevers which are repeated in the archeding between the side pillars. These arcades of cusplings are made of pieces of wood turned to the same curvature, so that the design is a repetition of arcs of circles, and the decoration is also a good example of stencilled patterns and frets applied to pillars, ribs, and coffers of roof.

The sea-walls and promenades of the Brighton Front are probably as extensive

as any in the kingdom. The massive concrete groynes which protect the beach from the ravages of the sea have well answered their purpose, and even the great storm of September 10 last week—a record storm, which will not soon be forgotten—has not done any considerable damage to these useful breakwaters. To show the violence of the waves on this occasion, we may mention that, in spite of the protection afforded by the groynes, on one portion of the front, between the two piers, the concrete and asphalt parade was undermined and broken away for a considerable distance; and Volk's Electric Railway, which now runs partly on the shore and partly on a timber viaduct above the beach, was undermined near Kemp Town; the concrete and ballast have been washed away from below the metals, leaving them suspended in places. But much greater havoc would have resulted to the beach and lower parades had not the concrete groynes and walls been constructed, and the municipal authorities of both Brighton and Hove deserve the best thanks of the inhabitants and of all visitors for their efforts to render the great sea-frontage—the King's-road—worthy of its reputation as one of the longest and best in the kingdom. There is much to interest the architectural tourist in the heart of rural Sussex. There is Cuckfield, possessing two fine examples of the domestic architecture of Elizabeth and James I. Cuckfield Park House is a stately mansion in a shaped in plan, though much restored and altered, so that its earlier form is obscured, and with exquisite wainscoting to the walls and noble fireplaces; and there is Oakenden, perhaps better known. Cuckfield Church is particularly interesting in its architectural details and monuments, and there is Slaughman Church, Slaughman Place, and other examples visited only the other day by the Sussex Archeological Society; but on these beautiful old houses and churches, romantic in their surroundings, we have no space to descant.

THE BRITISH ASSOCIATION AT SOUTHPORT.

THE second visit of the British Association to Southport, after an interval of twenty years, which has taken place during the past week, has not been characterised by any outstanding features of interest, and the attendance of members has been much below the average, less than two thousand tickets of admission having been issued. Sir Norman Lockyer, instead of devoting his presidential address to spectrum analysis, the observation of the sunspots, or some other phase of quasi-astronomical investigation usually associated with his name, made an appeal to the British Government for twenty-four millions for the endowment of at least eight new universities—a cool request to which the long-suffering taxpayer will not very readily respond!

In accordance with our usual custom, we notice a few of the papers read of special interest to our readers. A fuller report of the proceedings appears in the current issue of the *English Mechanic and World of Science*.

THE COMMERCIAL AND MILITARY IMPORTANCE OF GEOLOGY.

In his presidential address to the Section of Geology, Professor W. W. Watts, secretary of the Geological Society, considered the practical uses of such training in getting a topographical knowledge of a country—instancing the recent war in South Africa—which might be of immense military value. He also dealt with the importance of geological knowledge in connection with all economic questions relating to the mineral wealth of the Empire, especially in respect of the coming exhaustion of our present coalfields, and the paramount necessity of correct and accurate scientific knowledge of these new and deeper strata which will then have to be worked, and in conclusion urged the necessity for the study of geological maps and the more general teaching of economic geology.

WATER SUPPLY FOR TOWNS.

Mr. Charles Hawkesley, past-president of the Institute of Civil Engineers, stated that the

advances in recent years in chemical science, and the application of the science of bacteriology to the examination of water, had led to the condemnation of water which a few years ago would have been deemed to be perfectly suitable for a town supply. Whilst fully appreciating the advantages to be derived from the most careful examination of water supplied for domestic consumption, he thought that people were sometimes unnecessarily alarmed by the results obtained. Taking a broad view of the subject, and looking to the healthy condition of towns which for many years had been supplied with water from sources now regarded with suspicion, he thought that the teachings of chemistry and bacteriology were as yet but imperfectly understood. A Royal Commission recently recommended that a Government department be established, and endowed with enormous powers of interference with the action and discretion of the bodies entrusted by Parliament with the responsibility of the administration of water supplies; but it behoved these bodies to give careful consideration to the recommendations, and to take the necessary steps to check any attempts to give effect to proposals involving vast, and perhaps needless, expenditure.

AFFORESTATION AROUND RESERVOIRS.

Mr. Joseph Barry, M.Inst.C.E., engineer-in-chief of the Liverpool Waterworks, read a paper on afforestation of waterworks catchment area. He alluded to the fact that municipalities had of late taken to the purchase of land around their reservoirs, so as to better secure the purity of their water supplies. Over 100,000 acres had been thus secured by English municipalities, and the question now arose, how were those areas to be utilised? In order to reduce to a minimum the risks of polluting the water in a manner likely to produce disease, the first object must be to reduce the resident population to the lowest practicable limit. In considering the desirability of afforesting the gathering ground of waterworks, it must not be assumed that the proposition was to cover the entire area with trees. Questions of aspect, temperature, depth of soil, wind, rain, and frost, and other features, must be taken into account in determining where and what to plant. It was probable that the proportion of any gathering ground that could be planted with advantage would be found to vary from 25 to 75 per cent of the total. On those points it would be necessary to obtain competent expert advice, so as to avoid imprudent expenditure and to guard against failure. Mr. Parry explained in detail what had been done in the way of afforestation by the Liverpool Corporation at their Vyrnwy watershed in North Wales. Sir Bosdin Leech gave some information as to what had been done by the Manchester Corporation in the way of afforesting the watersheds from which the city's water supply is drawn, and expressed the hope that other corporations would follow the example of Liverpool and Manchester.

GARDEN CITIES.

Mr. Harold E. Moore, in his paper read in this section on "The First Garden City: its Future and Economic Results," said many who considered favourably the proposals of Mr. Howard and other speakers on "Garden Cities" were of opinion that the economic difficulties in their foundation were insurmountable. This question was now considered, as a site had been selected for the first of such cities. The site chosen, which would be in the possession of the Garden City Company from Michaelmas, comprised about 4,000 acres, coming to within one mile of the town of Hitchin and about 36 miles from London. The company would, doubtless, immediately erect a railway station in the centre of the estate, two and a half miles from Hitchin, make roads giving access to that station, erect and fit a cement factory, open a chalk pit, equip gravel pits, and do other work which would render available the natural resources of the estate. The total cost would then, probably, be about £180,000. This would be an average of about £30 an acre for the land, excluding the buildings and works at a reasonable value. Two different courses of procedure would then be possible. The first method was to lay out a model town with avenues and parks, and spend large capital in engineering works and buildings. It was suggested that this proceeding would result in failure. It would necessitate a large unproductive capital expenditure, cause annual expense in maintenance, involve serious financial risks, and reduce the present agricultural rental and value. The second method would be to attract

residents on small areas by offering sites with existing frontages at a rent-charge, and also to encourage manufacturers to take land by giving them sites on that part of the estate suitable for manufacturing purposes on condition that they took further areas at a rent-charge for the erection of cottages for their workpeople; these cottages to be erected by the manufacturer, the intending occupier, or by builders who conform to the stipulated "Garden City" regulations. It was suggested that this method would confer all the advantages claimed for "Garden Cities" with satisfactory economic results. The rent-charge, even in respect of the most outlying land, would reasonably be not less than 50 per cent. in excess of present rentals, while for building sites the rent-charge would be many times larger. The increased value secured by this increased rental without risk might then soon justify expenditure of capital on various town developments and improvements.

EXPENDITURE UPON HOUSING.

In the words of an able paper on the "Wealth of the Empire," read in the Economic Section by Sir Robert Giffen, the author dealt with the individual expenditure upon housing. The sum was very large, and probably in various directions, by individuals and classes, perhaps so much was spent that there was considerable economic waste; but for the mass of the people, the housing arrangements were not sufficient for civilised life, or even for good health. Great as the increase in this item had been since the report of 20 years ago—the expenditure being about double what it was then, with an increase of less than one-fourth in the population—they must look for further outlay in this direction as the wealth of the people increased, and the increase of accommodation had probably not been quite proportionate to the increase of expense. While our food bill had been lightened by the fall in prices, the expense of housing had been greatly increased, among other causes by the rise of rent in the neighbourhood of large towns through the steady growth of population and the monopoly value thus given to areas suitable for building. The expense of building had also been increased by the advance of wages in the building trades; but whether this advance was not largely balanced by a fall in materials, or the substitution of different materials, was not quite so clear. At any rate, there seems to be no doubt about the rise in rent, and the permanent causes of that rise, which certainly added to the complexity of the problem of the housing of the people.

RESISTANCE OF ROAD VEHICLES TO TRACTION.

The report of the committee appointed to consider the question of the resistance of road vehicles to traction, of which Sir John Thorneycroft is chairman and Professor H. S. Hele-Shaw secretary, was submitted to the Engineering Section. The report described experiments made with various kinds of tires on different descriptions of roadway and at varying velocities of travel. With iron tires on a roadway paved with setts 6in. by 3in., having a regular but fairly rough surface, and with a 1in. gap between the joints, experiments were made with a lorry wheel 40in. in diameter having a 3in. iron tire slightly rounded in section. By diagrams exhibited the rate of increase of tractive effort was shown to diminish with the velocity. The report attributed this suggestive fact to the circumstance that as the wheel travelled faster it had less time to fall into the little hollows in the roadway, merely skimming along the tops of ridges. The diagrams showed that with a load of 392lb. on the wheel, and at a speed of about 7½ miles an hour, the tractive effort needed was about 21lb. to 22lb. This power increased until at about 13½ miles per hour the tractive effort was a little over 26lb. Taking the highest curve in the diagram, which represented a load of about 952lb., it was shown that at about 8½ miles per hour the tractive effort was about 38lb. to 39lb. The power acquired increased until at 12 miles per hour the tractive effort was 50lb. With the higher load, therefore, the curve was very much steeper than with the lower load. Experiments with pneumatic tires were next dealt with in the report. A wire-spoked wheel 24in. in diameter and having a 2½in. tire was tried on a level stretch of macadam road in fairly good condition, but slightly gone in places. With a load of 315lb., and at a trifle over six miles an hour, the tractive effort was just under 20lb. Increase of speed brought a comparatively small addition to the effort needed to turn the wheel, for at

about 15½ miles per hour the tractive effort was registered at only about 21lb. more, approximately 21½lb. Again, with the heavier load the curve was steeper: for at 65lb., and at about 6½ miles per hour, the tractive effort was about 37lb., whilst at 15½ miles per hour the tractive effort was about 41lb. The difference between a light and heavy load was thus not so strongly emphasised as in the case of the iron tire. Experiments had also been made on wheels for heavy traffic. The conclusion arrived at was that, for heavy traffic wheels, tires of more than about 9in. in width had, in practice, little material value as tending to reduce road resistance or damage to the road surface. The report suggested that experiments might be carried out with the view to testing the accuracy of this conclusion. The theory was submitted that the supporting power of a road was limited by the cohesive friction of the road particles against each other. This supporting power—limit varied considerably according to the material and the moisture absorbed. These points were advanced by Mr. Diplock, a member of the committee, and he urged the committee to take steps to ascertain the maximum useful width of tire for heavy traffic, the limit of weight on each wheel up to which road resistance increased in direct approximate proportion to the increase of weight on each wheel, and the rate of increased road resistance when that limit was moderately exceeded.

PROBLEMS OF MODERN STREET TRAFFIC.

Lieutenant-Colonel Crompton, R.E., read a paper on this topic, in which he pointed out that, in spite of the large increase of improved means of communication, the average speed of travel in large cities amounted to about five miles an hour. This was due to the congestion of all those means of communication increasing in even greater ratio than the improvements in traction. In order to quicken the enormous existing wheeled and walking traffic, the author advised the establishment of a department of the police to take charge of the street traffic. Such a department could be the expert authority to determine what classes of vehicles were fit and proper to be used in the public streets and to advise local authorities and Parliament as to by-laws and regulations, and upon street widenings, improved crossings, new railways, subways, and tramways. In order that a street might accommodate the maximum number of vehicles it was necessary that these should be driven in parallel lines as close to the kerb as possible. In a 40ft. street it would be better to confine traffic in each direction close to the kerb, the remaining space being reserved entirely for overtaking and not to be encroached upon by opposing traffic. A table showing the number of passengers that could be conveyed along one road per hour in one line of omnibuses, each holding 26 passengers, and at varying speeds, clearly demonstrated the advantage of high speed and powerful brakes in preventing obstruction in the traffic. At three miles per hour, with an interval of 25ft. between omnibuses, 16,473 passengers would be conveyed per hour, but at twelve miles per hour the number would be 65,892. On the other hand, with an interval of 200ft. between vehicles at three miles per hour 2,050 passengers would be carried; at a speed of 12 miles per hour, with the same interval, 8,236 passengers would be conveyed. With motor omnibuses driven at 12 miles an hour at a 2-sec. time interval, nearly 33,000 passengers could be carried per hour. The author was of opinion that there should be no limit put to speed, especially in towns, other than that the vehicles should always be completely under control. An automobile vehicle at 12 miles an hour could be pulled up in less space than a fully-loaded omnibus running at an average of seven miles an hour. Accelerating and controlling power was given in a high degree by the electric automobile, which the author described as the vehicle of future town traffic. The steam-driven vehicle, however, had also the quality of control to some extent in common with the electrical vehicle. The petrol-driven vehicle was not so advantageous in this respect. Finally, the author dealt with walking traffic. With certain exceptions foot passengers should only be in the roadway at their own risk and peril, the exceptions being that they might cross the road at places marked by notices. In very busy thoroughfares subways or bridges should be provided.

THE PURITY OF WATER SUPPLIES.

In his inaugural address as president of the Zoological Section, Professor Sidney J. Hickson

OLD HOUSE, SWAN HILL, SHREWSBURY.

remarked that the growth of great cities and the improvement in their ideas of sanitation, had brought forward as important problems for consideration the purity of the water supply and the disposal of sewage. The municipal authorities at last realised that those problems could only be satisfactorily met by elaborate scientific investigation, and they had found that it was not only desirable for sanitary reasons, but also profitable, to call in men of science for consultation and advice. At present, however, those problems were approached from only two points of view, the chemical and bacteriological, the effects of other organisms than bacteria upon the character of the sewage effluent and the purity of water for drinking purposes being, so far as he had observed, neglected. In this connection he mentioned two cases which had come under his notice to show the kind of work which might be done. Some years ago the water of Burnley gave off an offensive smell, which was traced to the Hecknest reservoir, where the common water-snail, *Limnaea peregina*, was present in enormous numbers. A trained zoologist was consulted, and his recommendations led to the abatement of the nuisance at a minimum cost. Two years ago the chairman of the Manchester Corporation Water Committee reported the partial choking of the mains by the growth of what he called a "moss," of which no less than 700 tons had been removed by a laborious and expensive process. It was scarcely necessary to say that the organism was not a moss; it was probably not even a vegetable, but an animal belonging to the genera of fresh water polyzoa, but, so far as he was aware, no steps were taken to identify the organism, and no investigations were made to discover its origin, or to prevent the return of the trouble in the future. The fact was, their ignorance of the general balance of animal and vegetable life in the large reservoirs was profound, and a systematic inquiry conducted by competent persons would most certainly lead to knowledge which would be of great scientific importance, and, in the long run, remunerative to the community.

SHREWSBURY SKETCHES.

THIS year being the 500th anniversary of the Battle of Shrewsbury, the old town has received rather more prominent notice than usual, so that a few sketches may be appreciated by those interested in this ancient and historical borough.

No. 1, White Hall, a fine old mansion which stands in its own grounds near the Abbey Church, is a splendid specimen of Tudor architecture, being built in Elizabeth's reign by one

Richard Prince, a rich lawyer and courtier. It is constructed of red freestone, similar to that of the old abbey; but, unfortunately, the building has years ago been whitewashed, probably that its name may not be a misnomer. It has since, however, undergone a process of raddling, and although it now more resembles its original colour, the freestone has lost the rich hues which add so much to the beauty of the Abbey Church and the Castle.

The Gatehouse, No. 2, which has a frontage to Monkmoor-street, is a very interesting structure, and still retains the original studded oaken door.

The Half-Timbered House in Swan Hill, No. 3, is dated 1628. It is in an excellent state of

No 5

GABLES IN OLD INN YARD, SHREWSBURY.

preservation, and the porch, which has richly-carved brackets, forms a very pleasing feature.

Ireland's Mansion, No. 4, standing as it does in one of the principal streets, is more widely known than the house above referred to. It is a magnificent edifice, and was originally the town house of the Irelands of Albrighton, an old county family.

The Ancient Innyard, No. 5, surrounded as it is with dilapidated, though picturesque, gabled buildings, is entered by one of the quaint gateways so characteristic of the inns of this date. The brick gables which are seen to the left of

the sketch belong to Rowley's Mansion, said traditionally to have been the first brick building in Shrewsbury, having been erected by William Rowley, an Alderman of the Borough, early in the 17th century. It has been stripped of all its embellishments, and has for many years been used as a warehouse.

Golden Cross Passage, No. 6, is another of Shrewsbury's odd nooks. Here a pretty peep is obtained of the tower of St. Julian's Church.

REGINALD M. CORNALL.

POSSIBILITIES IN PHOTOGRAPHY.

"THE Linked Ring," as the members of the higher cult of photographers term themselves, have shown once more the limit to which the legitimate use of the camera can go in the art of picture and portrait making. The display of prints opened this week in the Dudley Gallery, Piccadilly, under the auspices of the Photographic Salon, again makes the restrictions of the process unquestionably evident, though the manifest aim of many of the exhibitors has been to render their photographs as little like photographs as possible, so that it is not easy to determine where the mechanical process ends and manipulation commences. The result, however this may be, is not artistic, whatever the skill and ability of the manipulator in endeavouring to imitate line or brush work by photography. The capabilities of the camera, aided by artistic comprehensiveness in the management of light and shade, are, of course, very considerable, and there is a great variety of thoughtful and artistic photography within the walls of the Salon this year; but we turn to these to show us the possibilities of the art rather than to the productions of more ambitious exhibitors, whose endeavours to reach the character and charm of the water-colour painter in monochrome are only destined to failure by assuming to be what they are not. At least the Linked Ring brotherhood deserves the credit of breaking away from the mechanical side of photography, and some of the members of the Salon rank amongst the most capable photographers of the time. Anyone who uses the camera would do well to see the exhibition, and to any of our readers who should pay the gallery a visit we would advise them to note a few points which attracted our attention. Possibly some little allowances should be made in this respect of preference in our choice of architectural subjects—and it is quite likely that, from a technical point of view, photographically speaking, we may have overlooked some notable triumph. Most of our readers, however, who do anything with the camera, find quite enough scope for its use in selecting buildings for their subjects. To anyone who does so let them look at the exquisitely-rendered and sympathetic view (223, by Mr. Walter Seutt) of "La Rue aux Fèvres, Lisieux"—that delightful old street of timbered gables and overhanging fronts of Gothic woodwork, so familiar to the lover of the picturesque. The photographer, while keeping to his legitimate sphere, has produced a charming study, soft and bright in the shadows, perfectly true to nature. Mounted on a greenish-grey mount in a plain little bead oak frame, this warmly-coloured study takes a lot of beating, small as it is. Mr. Frederick H. Evans shows less departure still from the ordinary use of the camera, but his prints are eminently pictures, enabling one to enjoy what they so beautifully show. Having spent some hours only the other day in visiting York Minster, we can all the better appreciate Mr. Evans's "Patch of Sunlight" (No. 151), giving a view of the double tracery and mullioned famous east window of the choir with its grand historic glass. The name of the print is due to a flick of light which appears on one of the aisle piers. The same photographer gives equally good views from Ely Cathedral, 50, 51, and 120, the last rendering being a fine study of the high light coming in by an open door with the reflected effect on the architecture of the interior. Mr. Walter Bennington's north-east view of St. Paul's Cathedral shows in a broad misty effect the outline of the cupola and western towers of Wren's masterpiece (83). Mr. Eastace Calland exhibits some diapered prints on woven stuffs of autumn flowers (5 and 15), which are intended for the ornamentation of hook-covers. The present examples scarcely, however, go beyond the limit of a suggestion. Mr. A. Horsley Hinton triumphs in photographic landscapes, and among his four (31, 182, 183, and 186) we like the first, called "Gorse," the best as a

bright and well-toned picture in which relative values are maintained. The others are very diverse in subject, but all in one respect agree—their lack of luminosity. Mr. Reginald Craigie's portrait of Mr. Hermann Vezin (42) is a fine study concentrated on the face of the sitter. Another good portrait is by Mr. Harold Baker, of Mr. Catterson Smith, the new head master of Birmingham School of Art (121), shown in profile. Mr. Fred Hollyer is represented by a notable photograph in his best style of Mr. E. W. Hornung (153), for which we have nothing but praise; and near it hangs a well-modelled photograph of a portrait study (14) of a man by Mr. F. H. Evans, showing that he is not limited to architectural subjects by any means. Miss Constance Ellis's "Extenuating Circumstances," in a legitimate use of photography, shows a group in an old-fashioned window—a mother and child, with an old man, presumably a curé, admonishing the little sinner (147). As to Miss Mabel Jennings's Indian ink and white studies of "Pierrot" (176) and "A Poster" (178), they have nothing in common with photography, and possess little art to recommend them otherwise. "Sunshine After Rain" (60), by Mr. Ward Muir, is another faked-up print, with high lights coarsely put in to get a water-colour paper effect. "Peg" (46), a girl with dog, makes a pleasing attempt at a washed-drawing mannerism which is best avoided under such conditions. "The Court of Directors of the Bank of England, 1903," by Mr. Reginald Craigie (22), is a capital example of the best type of interior photography, giving excellent portraits in a straightforward and artistic way well within the limits of capable camera work.

KING'S COLLEGE, LONDON: ARCHITECTURAL DIVISION.

THE Division of Architecture, which was separately constituted a year ago, will resume work on October 1, when the various courses of lectures and the studio for day students will be opened. A feature of the past session has been a visit paid by the students for measuring and sketching to Oxford, and it is intended to arrange a similar week's visit to some centre of architectural interest during the Easter vacation of the new session.

The evening lectures and the studio for evening students, supported by the Carpenters' Company, will open on Monday, September 28, when there will be a short opening lecture by the Professor, and new students can be enrolled. The evening fees have been somewhat reduced in most of the evening classes, and the Carpenters' Company are prepared to grant nominations to deserving students as in previous years.

ARCHITECTURE IN WOOD AND HALF-TIMBER.

GERMAN enterprise in the production of technical books finds a vastly larger encouragement at home than can in the ordinary course be said to be accorded to English books of a like class in England. This difference is, naturally enough, due to the vast number of State-aided and other colleges and technical schools in Germany. However this may be, foreign publishers are constantly issuing admirable textbooks on architecture and building subjects. The best photographic works on contemporary British buildings have been issued in Germany, with plans and particulars furnished evidently by the architects themselves. We have now before us the first two parts of a comprehensive and copiously illustrated work published in Berlin under the editorship of Professor Constantin Uhde, by Mr. Ernst Wasmuth, giving a graphic history of the construction and ornamentation of buildings from the earliest times in various countries. The book will be completed in four parts. Several of its illustrations are chosen from English publications, the *BUILDING NEWS* among the series, and there are many photographs from blocks with the letter-press printed in very good style. Some of the detailed diagrams are suggestive and useful as typical examples, notably those of the old houses in Brunswick, specially the illustrations showing the development of wooden buildings, leading up to stone architecture. The Swiss work, too, is ingenious, of course, and always interesting. The timber log houses of Norway are represented by some new photographs, a few being interiors. The com-

pilation of English timber work includes the Greyfriars Hospital at Coventry, shops Batchers, Shrewsbury, Moreton Old Hall, several fronts from Chester, and some good English roofs, old and also modern ones, though the illustrations vary in merit according to the source from which they are reproduced. Reprints of old lithographs do not go very well by the side of contemporary pen sketches and photographic pictures, so that the volume in this respect lacks the appearance of uniform thoroughness as a specimen of bibliography. The blocks on some of the pages are put the wrong way round for convenience of reference reading, from the left instead of from the right hand. Lintel and beam construction is traced through Persian chronology, the Theban Period of Egypt, and the Assyrian Palaces, the masterpieces of Greece and the triumphs of Rome, down from prehistoric days. In these two parts there are over five hundred illustrations. Spain and Italy are well represented, including some examples of arched and stone design. The title of the work is "Die Konstruktionen und die Kunstformen der Architektur," and the parts are issued in paper covers.

TIMBER TESTS.

THE Bureau of Forestry of the United States Department of Agriculture intends to resume the work of testing timber. The Bureau aims at practical results, such as the values expressing the strength and stiffness of the principal species of timber. These will be ascertained, not only for timber now in use, but for those not largely used, such as the Southern gums, Western hemlock, also for red fir, such as Oregon pine or Douglas spruce. The discussion on these tests at the Annual Convention of American Civil Engineers held during last June was instructive on many points. Mr. W. R. Hatt, Assoc. M. Am. C. E., refers to various technological processes. As to kiln-drying, it was found that, "for any temperature commonly used in drying timber no detrimental effect on the timber would be produced, aside from the checking action which might result from too rapid drying of the exterior portion of the stick. The effect of very high temperatures and pressures used in drying, as in the vulcanising process, is, according to former Government tests, to reduce the strength slightly." Further investigations are proposed to discover the best conditions for the prevention of "checking" methods of seasoning. The effect of bleeding long-leaf pine for turpentine is not detrimental to its strength, according to previous Government tests, and these are thought to be conclusive, and will not again be made; but we should think this "bleeding" would be distinctly prejudicial to the durability of timber, and further tests are to be made to find out this. The effects of fire-retardants on timber and their efficiency for various species are to be investigated, also their effects on nails and fastenings. The variations in timber are also important in making tests. The results of those on large sticks are lower than those obtained from smaller sections. Among the properties to be determined are the mechanical properties of species, such as strength, stiffness, resilience, hardness, and physical properties like shrinkage, swelling, and absorptiveness, identification by structure, and identification by appearance of sawn lumber. It is proposed to determine properties of structural timber in the market of the actual sizes, so as to determine moduli for design; to determine the value of woods considered inferior, the liability to knots and the reducing factors due to these; standards of weight for tabular use. Referring to preservative processes, Mr. Von Schrenk says: "Tests as to the direct influence of the preservative or the strength of various classes of timber should be conducted, as far as possible, with the exclusion of such factors as have been mentioned above. In other words, in testing the influence of zinc chloride on timber, all timbers tested should be subjected to a similar amount of steaming, kiln drying, or air seasoning, so that the only factor to be considered would be the impregnation of the chloride. Tests to determine the influence of preservatives on the timber should consider the use of the preservative in varying quantities, for it is entirely possible that a preservative used up to a certain strength does not weaken the timber, while excessive use may weaken it considerably. The following preservative processes should be included in any series of tests. 1. Zinc chloride. 2. Creosote or

tar-oil and its various forms, such as spiritine, carbolineum, &c. 3. A combination of zinc chloride and creosote. 4. Hassellmann or Barschall treatment. 5. The electrical process of timber treatment, using magnesium sulphate. 6. The Ferrell process, using various salts. 7. The creosote-resin process." The variable strength factor found in untreated wood should be eliminated in making comparative strength tests. The method of achieving this is to saw the given log into two pieces—one half is treated, and the other is untreated. The results, after the two halves were tested, eliminated this valuable factor, because the two pieces came from the same tree. The discussion, as given in the *Proceedings* of the American Society of Civil Engineers, is very important, and comprises many theories and suggestions of considerable practical value. A series of tests as proposed would enable the engineer and architect to compute the strength of timber with much more certainty.

A SANITARY CRUSADE ROUND THE WORLD.

MR. ROBERT BOYLE, of Messrs. Robert Boyle and Son, the well-known ventilating engineers, of London and Glasgow, has recently returned from what constitutes his eighth sanitary crusade round the world, he having circled the globe that number of times, preaching the gospel of pure air, and advocating the adoption of hygienic measures that would tend to secure the better health and consequent welfare of the peoples of the many countries he has visited from "China to Peru," Mr. Boyle having on one of his crusades travelled through China to its most remote boundaries, and last year the West Indies and South America.

Mr. Boyle is a practical as well as a scientific exponent of the laws of health, having devoted his whole life to the cause, and among the many benefits he has conferred on humanity as a pioneer in sanitary reform may be mentioned the £100,000 gift he made last year, on the occasion of his Majesty's Coronation, for the purpose of promoting the teaching of hygiene in the schools and colleges of the Empire, and inculcating the benefits to be derived from breathing pure air, and so make a strong and healthy people, and a strong and healthy Empire.

A CONCRETE-STEEL WATER TOWER NEAR BOSTON, MASS.

FORT REVERE is one of the fortifications which command the entrance to Boston Harbour. It is situated on a hill in the town of Hull. About one year ago the U.S. War Department advertised for bids for a steel standpipe inclosed in masonry tower for the water supply of this post; but bidders were permitted to submit proposals for other kinds of construction, provided their proposals were accompanied by plans and specifications setting forth clearly the character of the structure offered. Among the tenders received was one for a standpipe and tower of Henssliques armoured concrete construction, and, as this bid was some 30 per cent. lower than any other, it was accepted. The tower has recently been completed, and so far has proved perfectly satisfactory in service. There are a few tanks and standpipes of this type of construction in Europe; but it is claimed that this is the only one in the United States.

In the plans for the concrete structure the general idea of the tower remained the same as in the plans prepared by the United States engineers, but the steel standpipe was replaced by one of armoured concrete, and the octagonal inclosing tower was constructed with armoured concrete pillars and intermediate brick panels on a concrete base. The combination of these two materials makes a pleasing appearance, as the buff brick panels harmonise well with the grey colour of the concrete pillars and the base. The use of armoured concrete for the tower made it possible to reduce the thickness of the pillars which, if built of masonry, would necessarily have been of large dimensions in order to resist the wind pressure, since the tower is in an exposed position and the winds from the Hull Hills frequently blow at the rate of from 30 to 40 miles per hour. The foundations are of massive concrete, in which, beneath the centre of the standpipe, a gate chamber is formed from which a pip gallery extends to one side of the tower. Access is had to this chamber through a trap door by means of a ladder.

Fort Revere Concrete-Steel Water Tower: Three Stages of Construction.

The steep pyramidal roof remains substantially as originally designed, and has a heavy wooden frame covered with lin. boards and black slate. The total height of the tower above the ground is about 93ft. to the top of the finial, and the foundations are about 5ft. deep. The story immediately under the roof is arranged as an observatory, and is reached by a concrete-steel spiral stairway in the 2ft. space between the standpipe and the inside of the tower walls. The stairway is lighted by several windows piercing the brick panels of the walls. The observatory floor is 2ft. in the clear above the top of the standpipe, of concrete-steel construction 3in. thick, and supported by two reinforced concrete beams 6in. wide

shown by some of the drawings and described below, and its inside surface was coated with a watertight finish 1in. thick of 1:1 Portland cement mortar. When filled with water, there is no appreciable percolation, which testifies to the watertight qualities of cement construction when properly handled.

The bottom of the standpipe is 4in. thick, including the 1in. watertight mortar coating, and is reinforced with two layers of $\frac{1}{2}$ in. round bars placed at right angles to each other with the bars in each layer spaced 4in. apart and arranged as shown in the detail drawing. The ends of each bar are turned up about 1ft. into the wall. The junction of the bottom and wall is reinforced

with welded joints in the lower two-thirds of the height of the standpipe, and of $\frac{1}{2}$ in. round bars with wire-wound lap joints for the upper one-third. The vertical spacing of the hoops increases from the bottom upwards. For the $\frac{1}{2}$ in. hoops there are 23 $\frac{1}{2}$ in. spaces, 41 2in., 34 $\frac{1}{2}$ in., 22 3in., 13 $\frac{1}{2}$ in., and 23 $\frac{1}{2}$ in. For the $\frac{1}{2}$ in. hoops there are 9 3in. spaces, 6 $\frac{1}{2}$ in., and 6 $\frac{1}{2}$ in., the inner and outer hoops at each level up to this elevation being in the same horizontal plane. For the remaining 16ft. the two sets of hoops are staggered, the vertical distances between the successive inner and outer hoops increasing from 2in. to $\frac{1}{2}$ in.—that is, the hoops in each set are spaced from 4in. to 15in. apart. The ends of the bars in all parts of the work, excepting the hoops, of course, are split and spread slightly to afford a better grip in the concrete. The outside of the standpipe has a $\frac{1}{2}$ in. coat of Portland cement plaster and is whitewashed.

The three views present different stages in the progress of construction. The first view shows the interior mould for the standpipe, the staging, the elevator tower for handling materials and the placing of the steel armature. The second view was taken during the construction of the brick panels, and the third shows the finished tower. American Portland cement was used throughout. The concrete was mixed in the proportions of 1:3:6 for the foundation, 1:2:5 for the tower, and 1:2:4 for the standpipe. The sizes of broken stone used were $\frac{1}{2}$ in. for foundations, basement, and pillars, and $\frac{1}{2}$ in. for the standpipe and the observatory floor.

The tower was erected under the direction of Capt. Alfred M. Palmer, depot quartermaster, by Mr. R. Baffrey, manager for the Hennebique patents, 1123, Broadway, New York City, as general contractor.—*Engineering Record*.

CHIPS.

The Light Railway Commissioners have submitted to the Board of Trade for confirmation an order made by them for the construction of light railways in Southend-on-Sea and the Shoeburyness district.

The town council of Bolton agree at their last meeting to raise the salary of Mr. Morgan, the borough engineer, from £700 to £800 per annum.

A statue of the late Sir Thomas Elder has just been erected on the terrace in front of the Conservatoire of Music at the University of Adelaide, South Australia. The statue is of bronze, 9ft. in height, and rests on a pedestal of Aberdeen granite. It is by the well-known London sculptor, Mr. A. Drury, R.A. On the pedestal, which is 12ft. high, are four panels. The front one bears the inscription:—"Sir Thomas Elder, G.C.M.G., 1817-1897." The other panels, representing art, exploration, and benevolence, are designed to commemorate some of the works with which the name of Sir Thomas is prominently associated.

The Housing of the Poor Committee of the New-castle Corporation have recommended their council to proceed at once with the erection of workmen's dwellings on the Walker New-road Estate. There are to be 12 one-room dwellings and 52 two-room dwellings.

The ceremony of laying the foundation of the new church dedicated to St. Luke, at Newport, Mon., was performed last week. The new church will be erected on the site of a much smaller building, erected in 1857, and dedicated to St. Mark. It will be Early English in style, and will accommodate about 750 persons.

The Bridlington Town Council have decided to promote a Bill in Parliament empowering them to build a pavilion and other buildings on the proposed extension of the Royal Princes Parade. It has also been resolved to spend £2,100 on the erection of a pavilion round the new bandstand to accommodate about 2,000 persons.

At the meeting of the school board of the parish of Cathcart, which is practically a southern suburb of Glasgow, on Monday night, it was reported that sites had been secured in Albert-road, Langside, and Catkin-road, Langside, for the erection of two schools, each to accommodate 120 children, to meet the rapid growth of the population in that district.

The Bristol Watch Committee have received the approval of the Home Department to the plans for the new police-station for Brislington, which is to be erected near Bloomfield-road, at a cost of between £3,000 and £4,000. The building will include accommodation for fire-extinguishing appliances. Tenders will now be invited for the work.

The Local Government Board have given formal sanction to the borrowing by Boston Town Council of £14,220 to meet the cost of the Boston West sewage scheme.

Method of Reinforcing Concrete Steel Water Tower.

by 12in. deep, resting on pillars of the tower. This floor projects beyond the walls and forms a water table finished with a deep fascia. A section of the base of the tower, indicating the method of placing the steel reinforcements in it, is shown in one of the detail drawings. The exterior is blocked off in imitation of stonework.

The most interesting part of this structure, however, is the standpipe, which is 20ft. in inside diameter and 50ft. high. The wall is 6in. thick at the bottom and 3in. at the top, and resists a head of water 50ft. This wall is armoured, as

by additional $\frac{1}{2}$ in. round bars, bent as shown, anchored into the corner by stirrups 7in. long of 1in. by $\frac{1}{2}$ in. flat steel, and spaced 8in. apart. These bent bars extend about 20in. radially into the floor and rise about 2ft. in the wall.

The wall is reinforced with two systems of vertical $\frac{1}{2}$ in. round rods placed 2in. apart transversely and staggered, the bars in each system being spaced about 16in. apart circumferentially, and by two sets of horizontal hoops, each encircling one of the sets of the vertical rods. The horizontal hoops are made of $\frac{1}{2}$ in. round bars

OBITUARY.

The funeral of Mr. ISAAC GOULD, a well-known Leeds builder and contractor, who died on Tuesday week, at his residence, Westfield-terrace, Chapel-town, took place on Friday at Woodhouse Hill Cemetery, Hunslet. The funeral procession was joined at Hillridge-road by the workpeople employed by Isaac Gould, Limited, who marched in front of it until the cemetery was reached. Mr. Gould was a self-made man, having in early life been cashier and book-keeper to Messrs. Longley and Sons, builders, Hunslet, rising to be their confidential manager. After the death of the Longleys, he carried on the business for the widow of one of them until it was transferred to himself. He carried it on till his death, having been connected with it for over forty years. Among the many big contracts which the firm fulfilled were those for the Bishop's Palace, Wakefield; the new Asylum at Wakefield, the Standard Life Insurance Company's Buildings in Leeds, the last extension of Leeds Infirmary, and the repairing of Eecup Reservoir.

CHIPS.

We accidentally omitted to mention that we were indebted last week for the information on p. 333 about a Glasgow cold storage to our contemporary *Ice and Cold Storage*, and should like to add that architects not already familiar with this excellent monthly, published at 89, Farringdon-street, E.C., will always find therein valuable matter on the construction of cold stores and refrigerating appliances.

Mr. W. A. Ducat, a Local Government Board inspector, has held an inquiry into the application of the town council of Ealing to borrow £3,640 for the purchase of premises for the purposes of a technical school.

Considerable improvements are being carried out at the West Cliff, Cromer, for the Protection Commissioners. Messrs. Douglass and Arnold, of London, are the engineers, and the works will cost £1,700.

The Midland Railway Company have deposited plans with the General Works Committee of the Dewsbury Corporation, and with the Thornhill Urban District Council, for a bridge to cross the river Calder, this being in addition to the lofty viaduct which will pass over the stream as part of the Spen Valley line to Bradford. This bridge will have three spans of 11ft. each, be constructed of iron, the girders resting on four piers, two being in the river itself, and the width will be 30ft. from parapet to parapet.

The Great Northern Railway Co. have adopted a novel idea for relieving the dullness of the embankments in the cuttings on their main line. At Abbot's Ripton, between Huntingdon and Peterborough, patches of gorse grow on the high sloping banks, and an ingenious platelayer has, in his spare time, been cutting the little bushes into the shape of garden chairs, plants in pots, peacocks, dogs, and other birds and animals. The company now has men at work trimming the gorse or white thorn on the embankments into many fantastic forms.

The foundation-stones of a new church and schools in Station-road, Old Hill, in connection with the Strict Baptist denomination, were recently laid. The chapel will be capable of accommodating about 500 worshippers, the total cost being £1,400.

The King has sent £50 to the vicar of Grayne, near Rochester, towards the restoration of Grayne Church, Port Victoria. The church is of the 11th century; it was much damaged by a large fort put within a hundred yards of it in 1862, and is now being restored. The vicar has raised £1,100, but £700 more is needed, exclusive of the porch.

At last week's meeting of the Swansea Rural District Council three schemes were submitted for supplying Gorseinon and Pontardulais with water. The amended figures for the scheme were put forward by the surveyor as follows:—No. 1, £6,697; No. 2, £8,995; No. 3, £6,901. It was decided to adopt scheme No. 3, and the preparation of plans in detail will be proceeded with at once.

The death is reported from Boston, Mass., of Mr. Frederick Law Olmsted, the eminent American landscape painter.

The tender of Messrs. Strong and Moore for the laying-down of the permanent way for the Pietermaritzburg electric tramway system, at £16,856, has been accepted.

Duke-street Congregational Union Church, Leith, which for the past two months has been undergoing alterations, was reopened on Sunday. The interior has been completely modernised. Electric lighting has been installed throughout the building, and the arrangements for ventilation and heating have been brought up to date. The interior has also been painted, the roof being ivory white and the walls light terracotta. The alterations have cost £500.

COMPETITIONS.

LEITH.—At Monday's meeting of Leith Parish Council held on Monday night, it was moved that Mr. J. M. Johnston be appointed architect for the proposed new pothouse building at Seafield, he being the designer of the plan selected by the council. To this an amendment was proposed that the official appointment of the architect be delayed until the Local Government Board had sanctioned the plans. But the original motion was carried by twelve votes to five, and Mr. Johnston received the appointment.

OWEN JONES PRIZE.—This competition was instituted in 1878 by the Council of the Society of Arts, as trustees of the sum of £400, presented to them by the Owen Jones Memorial Committee, upon condition of their expending the interest thereof in prizes to "Students of the schools of art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Board of Education, South Kensington. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design" and a bronze medal. The following were the successful candidates:—James W. Blackburn, School of Art, Huddersfield, design for woven muslin; Edwin Moss, School of Art, Macclesfield, design for tile panel; Tom H. Bailey, School of Art, Macclesfield, design for furniture silk; Abram Goodman, School of Art, Leeds, design for cretonne; Louis C. Collier, School of Art, Nottingham, design for lace curtain; John Brown, Kent-road Art Class, Glasgow, design for printed velvet. The next award will be made in 1904, when six prizes will be offered for competition.

The Roman Catholic Pro-Cathedral Church of St. Andrew's, Dumfries, was reopened last week, after undergoing an extensive process of restoration. The panels behind the sanctuary have now been filled in with two large pictures, copies from the church of St. Gregory, Rome, representative of the flagellation and martyrdom of St. Andrew, and a third, an adaptation by Mr. G. McLellan Arnott, Dumfries, of which the subject is the adoration of the Virgin Mother by St. Andrew and St. Ninian. A new silver door for the tabernacle, enriched with deep incised work emblematic of the Last Supper, has been presented by an anonymous donor.

Mr. W. B. Woodhouse, A.M.I.Mech.E., A.M.I.E.E., has been appointed resident engineer to the Yorkshire Electric Power Co. Mr. Woodhouse has been with the Newcastle Electric Supply Co. since their pioneer power scheme was started.

The city council of Truro have decided that Messrs. Beesley, Son, and Nichols' alternative scheme for the interception and disposal of the sewage, at a cost not exceeding £21,400, be submitted to the Local Government Board for their sanction and approval.

At the town-hall, Tedmorden, on Thursday last week, Mr. W. O. E. Meade King, M.Inst.C.E., held an inquiry as to the Tedmorden Corporation's application for permission to borrow money for the purpose of sewerage and sewage disposal works. The corporation intend to spend an additional £10,543 on sewerage works. Previously borrowing powers had been obtained for £28,780, so that the works will cost £39,323, owing to a deviation from the original scheme and a diversion of the river Calder. Sanction was also asked for an extra £2,300 to be spent on the Walsden sewers. Mr. C. R. Peace, borough surveyor, gave evidence in support of the scheme.

On Thursday, the 10th inst., the president (Mr. Butler Wilson, F.R.I.B.A.) and council of the Leeds and Yorkshire Architectural Society entertained the members of the Library Association, who are holding their annual conference in Leeds, to a smoking concert at the Queen's Hotel, to meet the members of the Leeds Savage Club. Among those supporting Mr. Butler Wilson in the chair were the Lord Mayor of Leeds (Mr. John Ward), Professor Macneille Dixon (president of the Library Association), the Vicar of Leeds (Dr. Gibson), Sir W. H. Bailey, Lieut.-Col. Robinson, Mr. Edmund Bogg (chief of the Leeds Savage Club), the Rev. H. Egerton Leigh, Dr. Coleman, Mr. F. H. Barr, and Councillor S. A. Hirst.

A new Society of Artists, Painters, Sculptors, and Architects has been formed in Paris, under the presidency of M. Frantz-Jourdain, with the idea of holding an exhibition at the end of next month, and hereafter annually. All information may be obtained from M. Nicolas Groppeano, 33, Rue Bayen, Paris.

PROFESSIONAL AND TRADE SOCIETIES.

MUNICIPAL AND COUNTY ENGINEERS AND SURVEYORS.—About fifty members of the Incorporated Association of Municipal and County Engineers attended the home district meeting, held on Thursday and Friday at Hastings under the chairmanship of the President, Mr. Wm. Weaver, M.I.C.E., of Kensington. The proceedings were opened on Thursday with a reception by the Mayor of Hastings, who was accompanied by Mr. P. H. Palmer, the borough engineer, at whose invitation the visit was paid to the town. At the business meeting Mr. R. J. Thomas, hon. district secretary, was re-elected to that position. Papers were read by Mr. Palmer on "The Hastings Waterworks" and "The East Hill Water-Balance Lift." The afternoon was spent in visiting the municipal dust destructor, the East Hill lift, the Filsham pumping station and reservoirs at Newgate, and other places of interest. Friday morning was devoted to discussing the papers read the previous day, and in the afternoon a visit was paid to the Brede Valley waterworks in course of construction. The total cost of the works and of prospecting will amount to £145,000. The scheme will be completed in about twelve months. The corporation electric light works were also inspected.

NORTHERN ARCHITECTURAL ASSOCIATION.—The members of this association will hold an excursion meeting at Sunderland, to-morrow (Saturday) afternoon, and will visit the Higher Grade Junior School, and the Hylton-road Carsheds. The association's circular contains the following statement in reference to the former President, Mr. Glover (now of Windsor):—"Our very hearty thanks are due to our past President, Wm. Glover, Esq., F.R.I.B.A., for having so very kindly presented the association with £1,000 of Consols, invested in the names of the President and Hon. Secretary as trustees. Not less than one-quarter or more than one-half of this capital may be withdrawn at a future date towards the cost of a building for the association. The annual interest from the capital amount is to be used for our society's educational work. The hon. solicitor is kindly preparing the necessary trust deed. In due course fuller details in connection with this very generous and valuable gift will be laid before our first indoor meeting, when an opportunity for united and further thanks from the whole association will be sent to our benefactor and friend."

THE SOCIETY OF ARCHITECTS.—The "house list" of nominations for officers and council of the Society of Architects for the ensuing session is as follows:—President, †Walter W. Thomas, of Liverpool; vice-presidents, †A. E. Pridmore and *G. Gard Pye, both of London; honorary secretary, *Ellis Marsland, London; members of council (twelve): *R. G. Bare, London; G. E. Bond, Rochester; *F. W. Chancellor, M.A., Chelmsford; C. Cole, Exeter; *Wm. Cooper, Hastings; A. Currey, Jersey; *J. W. Dyson, Newcastle-on-Tyne; *H. E. Knight, London; J. C. Jackson, London; *F. W. Macey, London; *B. R. Tucker, London; and R. Frank Vallance, F.R.I.B.A., Mansfield. Honorary corresponding secretary, *W. R. Mallett, F.S.I. [An asterisk (*) denotes proposed re-election; a dagger (†) proposed change of office.] Additional nominations may be made by any three members who shall send in their nomination to the council before Oct. 1.

The memorial to the officers, non-commissioned officers, and men of the 1st Batt. Oxfordshire Light Infantry who fell in South Africa will be unveiled at Oxford to-morrow (Saturday) by the Bishop of Oxford at 3 p.m. The site of the memorial is by Magdalen Bridge.

President Eliot, of Harvard University, recently designated architecture as perhaps the most learned of the professions, on account of the variety and complexity of the subjects required to be mastered by the practical architect who was ambitious to be regarded as an "all-round man."

At Truro Cathedral good progress is being made in the removal of the scaffolding round the central spire and tower; various minor improvements have been made in the interior of the cathedral; the design for the stained glass to be placed in the western windows is completed, and the system for protecting the cathedral from lightning is in hand. The terracotta panel, presented by Mr. F. Waters Bond, will shortly be in position to the cathedral, and arrangements are in progress for clearing the cathedral precinct to the north of the building.

Building Intelligence.

BIRKENHEAD.—The Nurses' Home recently built in connection with and adjoining the Birkenhead Borough Hospital will be opened by Sir Elliott Lees, Bart., M.P., on Saturday, the 26th inst. The home, which fronts Livingstone-street, consists of ground and first floors. The dining-hall and dayroom on the ground floor are convertible, if required, into one room. A feature of the overmantel in the dining-hall is a portrait of the late Mr. William Laird. The building is lighted throughout by electricity. The contract for the building has been intrusted to Mr. Peter Rothwell, of Birkenhead, the whole being carried out from the drawings prepared by and under the superintendence of Mr. Edmund Kirby, F.R.I.B.A., of Liverpool.

BRIGHTON.—The memorial-stones of the Baptist church and schools, Gloucester-place, Brighton, were laid on September 16. The building is to be faced with whole-white flints, with red dressings; the seating to be in Orham wood, wax-polished. The accommodation will be for 443 adults on ground floor, 282 in galleries, total 725, or a mixed congregation of over 800 persons. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's-inn, Strand, London, W.C. The builders are Messrs. Battley, Sons, and Holness, 21, Old Kent-road, London, S.E. The present contract is for £5,381, exclusive of galleries (except choir gallery).

BROMSGROVE.—The Earl of Coventry, lord lieutenant of Worcestershire, laid on Thursday in last week the foundation-stone of the second lunatic asylum for the county, which is to be erected on the Barnsley Hall estate, near Bromsgrove. The present asylum at Powick, near Worcester, has accommodation for over 1,000 patients, and has for a considerable time past been quite full. The new estate comprises 324 acres. The plans show accommodation for 570 patients, with administrative buildings, and provide for possible extension. The contract for the building amounts to over £150,000, and the total cost is estimated at nearly £216,000.

CLIFTON, BRISTOL.—On Saturday afternoon St. Paul's Church, Clifton, was reopened at a special service, when the new reredos, chancel screen, and windows were dedicated. The reredos is 20ft. in height. The base and altar step are constructed of verte antico marble, known as the upper part is constructed of teak wood, richly carved and embellished with gold, and the centre panels are filled in with mosaic work. On both sides of the reredos are mosaic panels framed in teak and surmounted by a cornice. The centre-panel subject is "Angels adoring the risen Christ," the left-hand panel represents "The Nativity," and the right-hand panel "The Crucifixion." The eastern wall and the north and south walls of the chancel, and also the roof, have been decorated with fresco work. In the spandrels of the arches are four painted figures of angels. The architect for the alterations, under whose superintendence the work has been carried out, is Mr. H. C. M. Hirst, A.R.I.B.A., of Broad-street, Bristol. The north transept is about to be decorated to harmonise with the general scheme followed in the chancel.

FAZAKERLEY.—The Sanitary and Hospitals Committee of the Liverpool Corporation have just paid a visit of inspection to the site on which building operations have been commenced in connection with the great hospital, which is to contain 300 beds, consisting of nine ward pavilions and four isolation blocks, with entrance in Longmoor-lane, and to cost approximately £130,000. The operations are being carried out from plans by Mr. E. Sheldermine, city surveyor; the clerk of works is Mr. James. There is already on another portion of this spacious site, spreading as it does over 120 acres, a hospital wherein 150 patients can be received. This block is exclusively for smallpox.

GLASGOW.—The University Court, at a special meeting, has had under consideration the alteration of the plans for building extensions involving an expenditure, including fittings, of nearly £100,000. The plans already adopted provide for two separate buildings, one on the north and the other on the south of the main avenue, thus trenching on the recreation grounds, on which a large sum was expended by the exhibition authorities in 1901. Since the adoption of these

plans a strong opposition sprang up, and the alternative plan which the Court was called upon to consider was based on designs by Mr. Millar, architect of the exhibition, providing for all the departments in one new building north of the avenue. The Court, after full consideration, decided that there were not sufficient reasons for stopping the present operations.

GOVAN, GLASGOW.—The Elder Free Library, which has been gifted to the burgh of Govan by Mrs. John Elder, who has, in addition, endowed the building, was opened on Saturday afternoon by Dr. Andrew Carnegie. The library, which is classic in character, occupies a site at the south-east corner of Elder Park. An entrance portico forms the central features of the chief front. The interior includes newsroom, reference libraries for men and women, museum, juvenile room, librarian's room, and lending library. Accommodation is provided in the last for between 30,000 and 40,000 volumes. The architect is Mr. John James Burnet, A.R.S.A., Glasgow, and the cost has been £27,000.

IPSWICH.—A new Wesleyan chapel in the Bramford-road was opened last week. It has been built from plans by Messrs. Eade and Johns, of Ipswich, and is in style Decorated Gothic. It will eventually be cruciform in plan. The front portion, the nave, which seats 400 persons, is now used as the church, while the back portion, the transepts and eventual organ recess, will be used at present as a Sunday schoolroom. A vestry is placed on each side of the chancel recess. There is an open porch approach from the front with lobby entrances, and with space reserved for stairs to a future gallery to accommodate 80 persons. When the division between the present school and chapel is taken down, the building will form one chapel capable of seating 750. Then it will be possible to erect a Sunday-school on ground on the east side, which is held in reserve. The heating of the chapel is by gas-pits. The internal roof has bold arched ribs, and is divided up into smaller ribs forming panels. Outside, the building, which is faced with red brick, is ornamented with white terracotta. The cost has been about £4,000.

NORWICH.—The new church of St. Mary Magdalene, in St. James's Parish, Pockthorpe, is nearing completion, and will be opened on November 1. A chancel and four bays and the porches have been erected as a first section. The church is in the Later Perpendicular style, and will accommodate 500 persons. The walls are of brick and blue lias stone, lime-faced externally, with local flints and Monkspark stone. The east window of the north aisle will be filled with stained-glass, the subject being "Faith, Hope, and Charity." No provision has been made for a tower, but there is a bell gable at the west-end of the church. Altogether something over £4,000 has already been spent. Mr. A. J. Lacey, of Norwich, is the architect.

OSBORNE, I.W.—Good progress is being made for the Royal Naval College on the hillside above Osborne, East Cowes. The three existing bungalows, all connected by a covered way, will accommodate 75 youths. Six more are already in hand, and the accommodation will be expanded for 300 cadets. The classrooms are arranged round the quadrangle of the old Osborne stables. The gymnasium measures 63ft. by 40ft.; the recreation-room, 102ft. by 40ft.; and the bungalows, with cadets' dormitories, bathrooms, &c., 170ft. by 26ft., with a height from floor to ceiling of 25ft. The water-tank in the tower has a capacity of 7,000 gallons, and there are good quarters for the Marines, band, and others. The new bungalows will be larger, and each will have a sitting-room attached. The foundations of the buildings are of 16in. concrete, the inclosed space being filled with gravel, while the wooden uprights are completely encased, and the walls filled with Uralite.

SHIPLEY.—The urban district council of Shipley, near Bradford, are seeking permission from the Local Government Board to borrow a sum of £24,000 for the purposes of erecting new public offices. At present the council has its offices at the Manor House in Kirkgate, an old building bearing the date of 1670. The council purchased the present site, having an area of three-quarters of an acre, some years ago, at a cost of £3,400. It is proposed to erect, in addition to offices, a fire brigade station and baths. The office block, including the caretaker's house, is expected to cost about £10,500, fire-brigade station £2,700,

swimming-baths and workshops £1,000. The main building is to have a frontage to Kirkgate, where the main entrance will be placed. On one side will be the offices of the clerk to the council, rate collector, and accountant, and on the other offices for the education committee and the medical officer. The first floor will contain the council chamber, committee-rooms, and surveyor's department. A lift will be provided, and there is to be a clocktower over the entrance.

ST. ANNE'S-ON-SEA.—A new Wesleyan church is about to be built in Church-road, St. Anne's. The trustees invited a number of well-known architects in Lancashire and Yorkshire to send in competitive designs for a new church, and from eight sets of plans received, a design sent in by Messrs. Herbert and Walter Wade, of St. Anne's and Blackpool, was selected. Messrs. Wade had sent in two dissimilar designs, and both were chosen in the last three for final selection. The one adopted is Gothic in style, and when complete the edifice will have cost about £5,500, and will seat 750 worshippers. At present it is proposed to defer the building of the transepts and gallery, so that the accommodation will be for 500. Parapets with yellow stone dressings are to be used for external walls. The interior will consist of nave, two deep transepts, chancel, and an end gallery. The pulpit will be placed at the angle of the chancel, and the choir stalls in the chancel. The minister's vestry will be adjacent to the pulpits and on the opposite side are the organ-chamber and choir-vestry. The seating, dados, and roof timbers will be in pitch-pine, and the roofing of Westmoreland green slates. Leaded lights will be inserted in the plain Gothic windows. The tower and spire will rise to a height of 120ft.

CHIPS.

Mr. G. J. Edmundson, of Ledbury, has been appointed surveyor and inspector of nuisances to the Stourport Urban District Council.

On Thursday evening in last week a public inquiry was held at the Guildhall, Lichfield, before Mr. H. P. Boulnois, inspector of the Local Government Board, in respect to the application of the city council to borrow £3,150 for the erection in Upper St. John-street of dwellings for the working classes. Mr. Emerson Brooke, the city surveyor, explained the plans which he had prepared for the corporation.

On Wednesday week the whole of the staff of Mr. H. Eeles, builder, Sevenoaks, eighty in number, who had been employed upon the model bakery, cottage, and stabling in Buckhurst-avenue, for the Sevenoaks Co-operative Society, Ltd., were entertained at supper at the Oddfellows Hall by the committee of the society. Mr. W. Lambert (president) occupied the chair, supported by Mr. E. Pawley (of the firm of Llewellyn and Pawley, architects) and Mr. H. Eeles, builder.

The urban district council of Mansfield Woodhouse have decided to apply to the Local Government Board for sanction to borrow £17,000 for sewage works and sewage-disposal.

Mr. F. J. Margereson has been appointed surveyor for the southern district under the Chesterfield Rural District Council. He at present holds a similar position under the Brampton and Walton Urban District Council.

A large clock has just been erected in the parish church tower, Cornholme, Lancashire, which shows time on one large dial, and strikes the hours. It has been made by Messrs. John Smith and Sons, Midland Clock Works, Darby, to the designs of Lord Grimthorpe. The same firm have just received an order to make a large chiming clock with four dials for the Nelson Corporation in the same neighbourhood.

A new Wesleyan chapel at Hton, near Chard, was formally opened on Friday. The erection and equipment of the building has cost £520. The architects were Messrs. Symes and Mudge, of Chard, and the contractors Messrs. Parsons and Dunster, of the same place.

Active operations are in progress in Southwark in laying down two new and comparatively short sections of electric tramway route for the London County Council. Both are double lines; one extends through St. George's-road, from opposite the Elephant and Castle Hotel, Christ Church, Westminster Bridge-road, passing by the Roman Catholic Pro-Cathedral in Lambeth-road, where a junction will be made with the existing lines from the Hop Exchange to Lambeth and Westminster bridges, Wandsworth and Battersea; the other passes through Marshalsea-road, from Southwark Bridge-road to St. George's Church, at the junction of Borough High-street and Long-lane.

Engineering Notes.

ELECTRIFICATION OF SNOWDONIA.—Operations have now been actually commenced by the North Wales Power and Traction Company, Limited, for the electrification of Snowdonia. The scene of these initial operations is Llyn Llydaw, one of the lakes on the slopes of Snowdon, where the River Glaslyn has its source. Here it is intended that the first generating station contemplated by the scheme shall be situated. Among the more important schemes under consideration are the construction of a light railway from Portmadoc, through Beddgelert to Rhyddu, to join the present narrow-gauge railway, which will then be extended from Dinas to Carnarvon, the whole line to be worked by electricity. It is also proposed to electrify the Snowdon Mountain Tramroad to the summit, and to supply electric power to the quarries in the Nantlle Vale, the Gwyrfai district, and Llanberis. All the towns of the Menai Straits, including Beaumaris, Bangor, Menai Bridge, Port Dinorwic, and Carnarvon, are embraced within the scope of the contemplated operations.

CHIPS.

The town council of Wolverhampton held a special meeting on Friday to discuss the question whether they should take over the electric tramways with the underground traction system laid down by the Lorain Steel Company, or should carry out a method of overhead traction. After several hours' discussion it was finally resolved by 23 votes to 15 against to take over the tramways from the Lorain Steel Company for the sum of £22,000, the company to supply 5,000 new boxes, which will effect a saving of £500 per year.

The statue which is being erected to the memory of Prince Christian Victor, of the King's Royal Rifles, at the foot of Thames-street Hill, Windsor, will be unveiled early in November, during the residence of the King and Queen at the Castle.

The Norwich Board of Guardians decided at their last meeting to add a nurses' home to the workhouse at an estimated outlay of £3,000.

The proposal to erect a memorial to the men of H.M.S. *Doris* who fell in the South African war is now taking definite shape. The War Office has given a pom-pom which was captured by the Naval Brigade before Ladysmith as part of the memorial, and it is proposed to erect it in Devonport Park. It is proposed to place the pom-pom on a huge pedestal of granite, in which will be inserted marble slabs recording the object of the memorial and the circumstances under which the pom-pom was taken from the Boers. The work is to be executed by Messrs. Harry Hems and Sons, of Exeter.

Mr. A. E. Sanford Fawcett held a Local Government Board inquiry at the town-hall, Brierley Hill, on Friday, into the application of the urban district council for sanction to borrow £25,850 for a system of deep drainage within the district. Mr. J. H. Wilcox, consulting engineer, explained the proposals.

At a representative meeting held in the Free Library Buildings, Dundalk, it was resolved to establish a County Louth Archaeological Antiquarian Society. Mr. Joseph Dolan, M.C.C., presided. It was decided to defer the election of officers of committee until January, and in the mean time a provisional committee to organise the society was formed, with Mr. O. J. Kelly, J.P., as treasurer, and Henry Morris as honorary secretary.

An inquiry has been held on behalf of the Local Government Board at Horwich, Lancs, into an application for sanction to borrow £12,000 for sewage works designed by Messrs. Hinnell and Murphy, M.N.I.C.E., of Manchester and Bolton. The sewage to be treated is 500,000 gallons dry-weather flow, and the scheme provides for a population of 20,000.

The Columbian Fireproofing Co., Ltd., 37, King William-street, E.C., have obtained the contracts for fireproof floors, and have commenced the work, at the Hospital for Consumption, Liverpool, for which the architects are Messrs. Grayson and Ould, F.F.R.I.B.A., of Liverpool, and the new Mission Hall, Bethnal Green, for which the architect is Mr. S. Clifford Tee, F.S.I., 50, Moorgate-street, E.C.

Mr. E. A. S. Fawcett, an inspector of the Local Government Board, held an inquiry on Friday at Stourbridge into an application by the urban district council for power to borrow £1,000 for the purchase of land and for the provision of a refuse destructor.

At Stratford-on-Avon, on Tuesday, the new women's workhouse infirmary, erected and furnished at a cost of about £1,000, to accommodate thirty-three patients, was opened.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to **THE STRAID NEWSPAPERS COMPANY, LIMITED.**

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXXI., LXXIV., LXXV., LXXVI., LXXVII., LXXVIII., LXXIX., LXXXI., LXXXII., LXXXIII., LXXXIV., LXXXV., LXXXVI., LXXXVII., LXXXVIII., LXXXIX., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

*. Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—H. W.—R. G.—D. N. and Co.—R. E. C.—W. C. L.—F. T. S.—E. G.—K. C.—P. L.

Correspondence.

SUGGESTIONS FOR FIRE PREVENTION.

To the Editor of the BUILDING NEWS.

SIR,—The paper by Mr. B. Dicksee embodies many of the ideas of previous writers, and would be greatly in advance of the present Building Act regulations. The whole matter will shortly be considered by all the bodies interested in the matter, and while each committee will endeavour to make the best and most practical suggestions to the London County Council, it must always be remembered that great increase in the cost of buildings must be avoided, or there will be a still further exodus of factories, &c., from London to the outside districts where the regulations are not so strict. Many factories have been removed, and each one causes loss and injury to many persons.

It has been found that much injury has been done to tradesmen and others by the removal of dwelling-houses and of factories, and should a severe law cause the closing of the

present factories the condition of central London will be sad indeed, as rates are rapidly going up through the extravagance of local bodies in erecting baths and other buildings which are not really required.—I am, &c., SURVEYOR.

PROPOSED ALTERATIONS AT HARROGATE.

SIR,—On page 309 last week you call attention to a proposal to further disfigure the most frequented part of this flourishing watering-place.

The old Pump-house has some merit, and represents architectural art at the time of its erection. A few years since a very ordinary shed of iron and wood was erected adjoining the old building, and I found surveyors taking levels for the proposed new building.

I suggest, after considering the matter on the spot, that a properly designed stone building be erected on the site of Rose Villa and the end of the Valley Gardens, to form an appropriate entrance to the Valley Gardens, and give a spacious hall for the distribution of the nauseous water. Directly the work is completed, remove the ugly structure above referred to, and restore that side of the road to its former condition.

It is absurd at the present day to suppose that a good stone building could not be erected without interfering with the sulphur spring, when buildings in all directions have been erected.—I am, &c., HENRY LOVEGROVE.

SOME NEW BRIDGES.

SIR,—If one of the artistic members of your staff should take a stroll in the locality of the Hoxton portion of the Regent's Canal he will receive a severe shock, and wonder whether he is indeed in the third year of the 20th century. Two new bridges are being erected—one called the Rosemary Branch, giving largely-increased access between the Southgate-road and Bridport-place; the other, called Cat and Mutton, connects the end of Goldsmiths'-row with the London Fields. Nothing more hideous can be imagined surely for so narrow a span. Some graceful form could have been adopted, and a balustrade in place of the very plain built-up girders, with massive plain piers, which disfigure the view from both the canal and the road. I have no idea who is responsible for the design (or absence of it), but know that pounds are wasted in other structures in meaningless ornament, while here no attempt has been made to design graceful construction or to ornament construction.

How different are things on the other side of the Channel?—I am, &c., BALBUS.

The death occurred on the 8th inst. from pneumonia in his sixty-third year of Mr. Joseph A. Pippet, of Solihull, Warwickshire. As an artist his work was chiefly in connection with ecclesiastical decoration. Some of his paintings and window designs are to be found in St. Charles' Roman Catholic Church, Aigburth; St. Alexander's, Bootle; St. Marie's, Southport; and St. Mary's, Highfield-street, Liverpool.

At Jesmond Parish Church, Newcastle, on Sunday, four new stained-glass windows, which have been placed in the baptistry at the west end of the church, were unveiled and dedicated. The task of providing the windows was intrusted to Messrs. Wailes and Strang, of Newcastle. The four lights are in pairs, side by side, and each contains an allegorical figure, the four figures representing Love, Peace, Faith, and Hope.

The Infectious Diseases Hospital, Scarborough, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, patent Manchester grates, exhaust roof ventilators, outlet panels, and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. John Bellerby, J.P., D.L., of Burnholms, Heworth, York, died on Monday, aged 70 years. He was a native of the city and the only son of Mr. John Bellerby, proprietor of St. George's sawmills, and a timber merchant, with whom he was for many years in partnership. On his father's death he became sole proprietor, and carried on the undertaking with such success as to be able to withdraw from business life some 25 years ago. He subsequently devoted himself assiduously to public work in the city of York.

The date of the visit of Princess Louise (Duchess of Argyll) to Liverpool to lay the foundation-stone of dwellings for workpeople in a cleared area in Hornby-street is fixed for Wednesday, November 4. The dwellings will cost about £250,000, and a recreation-ground will be provided.

MIDLAND HOTEL, BIRMINGHAM.—ST. MARGARET'S CHURCH, LEEDS.—BEDFORD COUNTY HOSPITAL.—VILLAS AT PRENTON, CHESHIRE.—ALPHA LODGE, PARKGATE, CHESHIRE.—SMALL HOUSE AND GARDEN AT WINDERMERE.—SHREWSBURY SKETCHES.

Our Illustrations.

RECONSTRUCTION OF THE MIDLAND HOTEL, BIRMINGHAM.

Of the rebuilt portion of this hotel, we publish to-day the ground-floor plan and a view of the Stephenson-street front which faces the London and North-Western Railway Station. The ground floor is at the level of New-street, and a sharp drop in the ground causes it to appear as the first floor in Stephenson-street. Both these streets have public entrances, their halls, the connecting stair between the two levels, the ground-floor corridors, and principal staircase being lined with Skyros marble. The Stephenson-street level or lower ground floor includes a buffet lined with red Devonshire marble and alabaster, and a large billiard and smoking room, with the necessary adjuncts. The New-street level (ground floor) has a restaurant, with smoke-room adjoining—both oak-panelled—with retiring rooms in white marble up to the ceiling. On the first floor the commercial room is above the restaurant, and the commercial writing-room above the smoke-room, a similar block of retiring rooms to the one below being arranged close by, past which on both floors a passage leads to a very extensive range of stock-rooms. The coffee-room, with sundry private sitting-rooms, is also on the first floor, the former being in an old part of the building facing New-street but little affected by the alterations. As regards the bedrooms, about 130 out of 160 or more are in the old portions of the building, which extends for three floors in depth over the whole area of two large adjacent blocks, occupied in the lower stories as shops and offices. The water-supply is from an artesian well, sunk below the building, and is pumped up to a 10,000-gallon tank in the central gable of Stephenson-street. Steam for cooking, heating, &c., is generated in two large boilers. Electric lighting obtains all over the building, gas being used for cooking only. The kitchens are on the top floor, with four large lifts down to the public rooms below. Telephonic communication is provided for every bedroom. Below ground is extensive cellarage in a basement and sub-basement. The servants' and goods entrance is quite removed from public view, the servants being able to enter the building and reach the topmost floor unseen by the guests. The whole of the new part of the building is fire-resisting, having steel joists and coke-breeze concrete for flooring, with finished surfaces of cement in bedrooms, &c., and marble in corridors. The principal staircase is likewise of steel and concrete, with casing of white Sicilian marble. The lower mansard slopes of the roofing, with the ceilings of the top floor, are fire-resisting also. Ventilation of the large rooms is assisted by an upcast flue around a cast-iron smoke-stack from the

boilers, and by a propelling fan for the billiard and smoking room. Messrs. W. Henman and T. Cooper are the architects.

ST. MARGARET'S CHURCH, LEEDS.

Mr. TEMPLE MOORE is the architect of this church, but no further particulars have reached us.

BEDFORD COUNTY HOSPITAL: DETAIL OF ENTRANCE FRONT.

This working drawing by the architect, Mr. H. Percy Adams, shows the principal entrance to the administrative buildings of Bedford County Hospital. A description of the institution was given in our pages for Feb. 9, 1900, when some photographs appeared among the plates. Prior to that some other illustrations were printed in the BUILDING NEWS for Dec. 30, 1898, and Feb. 31, 1899. On April 23, 1897, a full account of the work was given in our journal.

VILLAS, PRENTON, CHESHIRE.

THESE villas have been erected for Mr. A. E. Williams, and are carried out in red brick, cement roughcast, and tiled roof. The contractor was Mr. Richard Allen, Birkenhead, and the architect Mr. T. Taliesin Rees, F.R.I.B.A., Liverpool and Birkenhead.

ALPHA LODGE, PARKGATE, CHESHIRE.

This residence has been erected at Parkgate, Cheshire, for Mr. A. G. Grenfell. The half-timbering is English oak, and the roof red tiles. The contractor is Mr. R. T. Amery, and the architect Mr. T. Taliesin Rees, F.R.I.B.A., Liverpool and Birkenhead.

A SMALL HOUSE AND GARDEN AT WINDERMERE.

This house is being erected at Windermere for Mr. R. R. Mawson, and has been designed, as far as possible, in character with the old surrounding Westmoreland buildings. Local material has

been used throughout. The walls of stone are roughcast and limewhited, the roof covered with green Westmoreland slates. Special attention has been given in designing the gardens, as indicated on sketch plan. The plan shows private offices, the house being in proximity to the owner's large Windermere nurseries. The drawing, which was in this year's R.A. Exhibition, is by Mr. A. N. W. Hodgson. The architect is Mr. Thomas H. Mawson, of Conduit-street, W., and Windermere.

SHREWSBURY SKETCHES.

(For description and further sketches see p. 369.)

The Prix de Rome at Paris has been awarded to M. Jausse, pupil of MM. Daumet and Esquié; the next two prizes have gone to M. Wielhorski, pupil of M. Laloux, and to M. Joulie, pupil of M. Pascal, all practising in Paris.

The eleventh panel, No. 9, out of the 24 in the ambulatory of the Royal Exchange, is now filled in with Mr. A. Chevallier Tayler's picture, "The Entertainment in 1336 by the Vintners' Company to the Five Kings"—viz., Edward III. of England, David II. of Scotland, John of France, and the Kings of Denmark and Cyprus. Mr. W. Vivian is the donor, and it is expected that this spirit-fresco will be unveiled this month.

Mr. Henry Theobald, F.S.I., of 6, South-street, Finsbury-pavement, E.C., has been appointed by the libraries committee of the Metropolitan Borough of Poplar as quantity surveyor for the proposed new public library to be erected at Poplar.

The Ditchling Parish Council has recommended the Chailey Rural District Council to adopt the scheme submitted by Messrs. Beesley, Son, and Nichols, of Westminster, for the sewerage and sewage disposal of the parish, at an estimated cost of £4,020 for the engineering works, subject to certain modifications.

QUESTIONS.

[12003.]—**Private Street Works: Apportionments.**—I have just apportioned the cost for making up a street (section 130 Public Health Act, 1875—see sketch enclosed herewith, from which you will see that the whole of the lineal measurement within the confines of the street is taken as frontage adjoining and abutting the street, and the apportionment made on the respective owners according to the actual measurement of their frontage directly adjoining and abutting the work. The owner of plot A states that he should not have been charged with the return measurement, and that his

frontage is 82ft. instead of 83ft. The street has a "bottle neck" at one end, as shown, and all the works carried out are common to the whole of the owners. I shall be glad to have your correspondents' views thereon.—Son.

[12004.]—**Reservoir.**—Will some reader kindly tell me what thickness of wall is necessary for a reservoir built with hard bricks in cement, the greater part being above ground, and the depth of water in reservoir to be 8ft., inside dimensions 17ft. by 12ft.? Should such a reservoir be covered, say, with concrete?—G. W. C.

[12005.]—**Pastel.**—Will some reader kindly explain to me the difference between a crayon drawing and a pastel?—P.

[12006.]—**Distances of Adjoining Buildings.**—If my neighbour wishes to put up a building parallel with the wall and eaves of mine, does the law prescribe the distance that must be observed between his wall and mine?—R.

REPLIES.

[12002.]—**Norwich.**—"Pencil Point" is so aggressive and exigent in tone that he hardly deserves an answer. However, I have just spent a couple of days in Norwich, refreshing early memories of the old city, so I will stretch a point to reply even to a querist who declines in advance "hashed guides." The Great Eastern Railway provides convenient services of quick and punctual trains by alternative routes—*viz.* Cambridge and Ely and *viz.* Colchester and Ipswich—but there are no excursions from London, although I noted when in the city some cheap ones advertised to the Metropolis. The chief attractions of Norwich to the architectural student are the Castle, the Cathedral, St. Andrew's Hall, and the many churches; but there are some remains of the old city walls, built of flint and rubble, visible in Chapel Fields, in St. Benedict's-street, and near Whitefriars Bridge, while at least four of the shells of the old circular towers by which the wall was defended remain, although these have lost all their freestone dressings. The Castle, which dominates the city from its central mound, was for ages occupied as a prison, and having been refaced with stone half a century ago, does not at first sight promise much to the sketcher. Nearly twenty years since, however, a new gaol was built elsewhere, and the Castle was transferred by the Government to the Corporation; it has since been converted, under the direction of Messrs. Edward Boardman and Son, architects, of Norwich, into a museum; the alterations have been carried out with good taste and careful conservation of all old features; and I was delighted to see how much rich Late Norman work of the 12th century exists in the walls facing the internal court of the keep, notably in the mouldings over window and door openings in blind arcades and in the galleries with which the stout ashlar walls are honeycombed and in the crypt. The great area of the keep is covered in one span, the modern glazed roof being supported by a light stone arcade carried on plainly treated piers of Norman type; but the fittings are Tudor in treatment, and it is easy to distinguish between the original work and that made good by Messrs. Boardman. The Cathedral, like the Castle, suffered terribly during the early days of the Gothic Revival, when genuine Perpendicular turrets and windows were replaced under Anthony Salvin by pseudo-Norman work—or what passed as such sixty years ago, and the end walls of the north and south transepts were recased in new stone. The disastrous process has been continued so recently as 1875, when the west front, always the least impressive feature of the minster, was refaced; the two prominent pairs of Elizabethan cupolas which capped the lofty pinnacles on either side of the great gable and flanked the western ends of the north and south nave aisles were replaced by sham 13th-century

pinnacles, with absolutely no authority or precedent; a crop of uniform crockets sprouted along either coping of the great gable, while for the small light in roof above the stone vault over the west window was substituted a meaningless and vacant niche. Perhaps I need hardly remind "Pencil Point" that Norwich Cathedral is essentially a Norman fabric, vaulted in stone throughout, as a sequence to successive fires in the second half of the 15th century; indeed, this minster, and the abbey of Tewkesbury and Westminster, which also have apsidal terminations, are the only English churches of the first and second rank entirely vaulted in masonry; the only fragment of Early English work is in the double entrance from the choir ambulatory to the destroyed Lady-chapel, and the Decorated period is represented by inserted clerestory windows and by the greater part of the cloisters, the largest and most beautiful in

England; the monuments in the building are few and of little interest of importance except that on the south side of presbytery to Bishop Goldwell, 1493, which has an effigy of the prelate in full pontificals. The modern works include a seated statue of Bishop Bathurst, 1837, by Chantrey, in south transept, and a recumbent figure of Bishop Pelham, 1893, by James Forsyth, somewhat stiff in pose, but an excellent likeness of the late prelate; it occupies the centre of north transept, on an obtrusively polished altar tomb of veined alabaster. There are four sixteenth-century altar tombs between the nave and its aisles, which have been several times shifted, and would be of more interest to the public if the Dean and Chapter provided cards giving in bold lettering the names and dates of death of those commemorated. During my former visits the interior of the cathedral has always seemed to me deplorably dusty, dingy, and unkempt, the wall surfaces were disfigured with ancient whitewash, and the transepts choked up by modern screens and pews. Under the *regimes* of Dean Lefroy these eyesores are things of the past, and cleanliness and order reign where dirt and neglect were too apparent. The whole of the walls, columns, arches, and vaults have been unlinked of their coats of ochre and whitewash, cement fillings in have been made good in sound masonry, decayed timbers restored, the floors of nave and transepts lowered and levelled, the foundations protected by an external course of concrete, and the doors of the triforium have also been laid with concrete, at a total cost of some £20,000. The only works in progress this week seem to be on the west walk of the cloister; but external repairs appear urgent, especially the unfortunate west facade. The "unliking" of the internal masonry, which was executed, not with the usual steel comb, but by smartly tapping the surface with a chisel, has not only revealed many traces of Medieval frescos and stencil colouring, but has made clear some constructional parts which have previously been difficult to understand. Even so independent an observer as Mr. Francis Bond speaks with awestruck admiration of the engineering feat performed by Bishop Goldwell when he replaced the Norman pillars and arches in the presbytery by new piers and four-centred arches in the fashionable style of his own day, leaving the original 12th-century masonry of the triforium unaltered. But an inspection this week of the actual work as cleansed shows that Goldwell only cut away the face of the masonry and applied a veneer at the thickest 2½ in. to 3 in. through of new stone, so that he had no need for anxiety as to the safety of the superstructure; indeed, on the ambulatory sides he left the Norman work alone where it did not show. I must utter a passing protest against the glaring polychromatic treatment of the apsidal Jesus Chapel, in which a plain, unaccompanied daily service is held. St. Andrew's Hall is the vast nave of a mid-14th-century Dominican church, bought of Henry VIII. for £50 by the corporation, who utilise it for concerts and public meetings, and have hung it with an interesting collection of portraits in oil of local worthies, by Gainsborough, Beechey, Herkomer, Frank Holl, Sandys, and J. P. Knight. Admission free, but a sixpenny tip to the hall-keeper will procure admission to the crypt below, to the chancel (now known as Blackfriars Hall), and to remains of cloisters on north side. I should have said that admission to the Castle is free from 10 to 4, excepting on two days a week, when a charge of 3d. is made, and that the Cathedral nave is open all day, the nimble sixpence opening the doors to transepts and presbytery; the vergers, wearing naval medals of the Egyptian campaign, is unusually well informed. "Pencil Point" should seek permission to walk round the wide triforia, but not forget the unprotected outlook into nave and presbytery, and the presence at irregular intervals and varying levels from ankle to knee of water and gas-mains and heating pipes. Besides these buildings there is the rather diminutive

but interesting Gaildhall, a flint-faced edifice in the Market Place dating from 1407, containing some excellent Tudor wood fittings in the council chamber, and over thirty Medieval churches, of which the chief is St. Peter Mancroft, a vast transepted 15th-century edifice, in the Market Place, with great western tower completed by G. E. Street nearly twenty years ago; St. Giles, a large Late 14th-century building, with tower 126ft., standing on a commanding hill site; St. John de Sepulchre in Ber-street, and the well-placed church, which has recently given rise to some controversy as to the restoration of the pinnacles to the tower just carried out by Messrs. Brewill and Bailey, of Nottingham. The old churches of Norwich are closely sprinkled along the lines of thoroughfare in the more ancient parts of the city, and in many cases seem sadly in need of reparation—the tide of well-to-do population has probably receded from them to the suburbs; but for this very reason "Pencil Point" will have much to study and sketch in almost every one, and every period from the 10th to the 19th century is represented. In modern church work I can only refer in passing to the vigorous treatment of a 13th-century motif in the Roman Catholic Cathedral at the top of St. Giles's-street. This has long been in hand, the long stone-vaulted nave now in use having been designed by the late Sir Gilbert Scott; the south transept has been added, from drawings by his son, Mr. Oldrid Scott, under whom workmen are now adding the eastern limb of the building, the cost being borne by the Duke of Norfolk.—E. W. H. P.

CHIPS.

The new car-sheds and repairing shops that have been erected for the tramways committee of the Sunderland Corporation in Hylton-road, Millfield, are now completed, and will be formally opened by the mayor on Wednesday, the 30th inst.

The works committee of Aberdeen Harbour Board has accepted the offer of Messrs. George Halliday, Ltd., to construct a new timber wharf at Pocka Pier at a cost of £12,968 6s. 7d.

The committee has now signed the contract and the work is in progress for the restoration of the ancient tower of St. Nicholas, Deptford, which dates back to the middle of the 12th century. During the past twenty years the tower has been in such a condition as to prevent the ringing of the bells (a peal of eight dated 1701), the rehanging of which at a cost of about £250 is a part of the present scheme.

Mr. James Mulcahy, an architect of some fifteen years' practice, has been appointed commissioner of buildings for the city of Boston, Mass., replacing Mr. Montague, who has been acting commissioner since the resignation of Captain Danrell. Mr. Mulcahy is still a comparatively young man, being only forty-three years old; but he has carried out a large number of important buildings in Massachusetts.

The City-square at Leeds was formally opened on Wednesday, and the statuary which adorns it was presented to the Lord Mayor for the citizens. The main gifts consist of an equestrian statue of the Black Prince, by Mr. Brock, R.A.; and statues of Dean Hook, by F. W. Pomeroy; Joseph Priestley, by Alfred Drury, A.R.A.; John Harrison, by H. C. Fehr; and James Watt, by the same sculptor. There are also two semi-nude female figures representing Morning and Evening, and executed by Mr. Brock.

The new Empire in Newgate-street, Newcastle-on-Tyne, the latest of the Moss Syndicate Palaces, was opened on Monday. The theatre is estimated to hold about 4,000 people. The architect was Mr. Frank Matcham, and the builders were Messrs. Howe and Co., of West Hartlepool.

The St. Pancras Brough Council decided, on Wednesday, after a long and animated discussion, by a considerable majority, and against the recommendation of its own electricity committee, to accept a tender for the supply of electric cables from a British firm, although it was £700 more than one received from a German firm.

The actual work of erecting the King's Sanatorium at Midhurst was commenced on Tuesday, a large gang of men being employed on the foundations of the building. The various portions of the work have been let to different contractors. Sir John Aird is responsible for the water supply and road-making, and Messrs. Longley, of Hornsey, have secured the contract for the foundations. The contract for the superstructure has not yet been placed. The architect of the sanatorium is Mr. A. W. West, whose design, selected in competition, was illustrated by plans and details in our issue of Jan. 30 of the present year.

At Rothsay Town Council meeting on Monday a letter was received from Mr. W. J. Windsor Stuart, factor on the Bute estate, intimating that he was directed by the Marquis of Bute to offer to the town council the fields known as the Meadows, extending to 1½ acres, for a public park and pleasure ground for the inhabitants of Rothsay, at a nominal rent of 1s. per annum. The generous offer was accepted.

Broughty Ferry Town Council had a special meeting on Monday night for the purpose of appointing a gas engineer and manager in room of Mr. Forbes Waddell, whose services were recently dispensed with. Mr. Keillor, of Peterhead, who is only twenty-nine years of age, was elected.

LEGAL INTELLIGENCE.

BUILDERS VICTIMISED.—At the Mansion House Police-court on Monday, Harry Tindall, 33, clerk, of no fixed abode, was charged before the Lord Mayor with stealing a sum of £52 19s. 3d., and with obtaining a situation by means of a false character. The prisoner in June last answered an advertisement for a clerkship in the service of Messrs. T. H. Mansfield and Sons, builders and contractors, in Upper Thames-street, and gave as a reference the name of a firm of builders in Hammer-smith, in whose employment he said he had been. From the latter a laudatory character of the prisoner was received, the letter being written on a printed heading. The prisoner was taken into Messrs. Mansfield's service, and three weeks afterwards a fellow clerk who had cashed a cheque for £50 at a bank handed the prisoner the coin to count. Making some excuse to leave the office, he decamped with the whole of the money and with £2 19s. 3d. more from the petty-cash box. Nothing more was heard of him until a week ago, when he was arrested at a Rowton House, where he was lodging under a fictitious name. It had meanwhile been ascertained that the written character was false, there being no builders of the name in Hammer-smith, and the address given being that of a newspaper shop where people had letters sent to them. The prisoner pleaded "Guilty" to both charges. The Lord Mayor sentenced him to four months' hard labour for the larceny, and fined him £20 on the other charge, with the alternative of an additional term of two months' hard labour.

ARCHITECT, ADVOCATE, AND MAGISTRATE.—At Welshepool, on Tuesday, Mr. Goff, architect, Burton-on-Trent, appeared on behalf of Messrs. Salt and Co., brewers, to ask the sanction of the Bench to plans for the alteration of Mytton's Vaults in Broad-street. Mr. Goff informed the Bench that certain doors were to be altered and one closed. The plans had been before the town council, and their approval obtained. At this stage a solicitor from Newtown rose, and, addressing the Bench, said he was not often heard making objections, but he would like to say that he was not aware if the gentleman who stood before the Bench making that application held a certificate allowing him to practise as a solicitor. Solicitors had to go through long training at considerable expense, and their work should not be taken out of their hands in that way. He protested out of no disrespect for the gentleman before the Bench, but simply in the interests of the profession. The chairman said he could not see why a person interested should not be asked to explain the matter to the magistrates. He could not see that any question of professional etiquette arose. They were simply following the practice of the Court as it had been for 31 years. The application was eventually adjourned.

AN IMPORTANT PARTY-WALL CASE.—A case of importance to owners of property who intend to rebuild was decided on Tuesday last at the City of London Court. The owners of No. 30, Bouverie-street, the *News of the World* Company, rebuilt the premises in 1893, and instead of giving the usual notices under the London Building Act, 1894, and rebuilding the old party-wall which divided the property from that of Mr. Apperley (No. 29, Bouverie-street), they elected to build an entirely new wall situate wholly on their own land. When Mr. Apperley recently commenced to pull down his premises with the object of rebuilding, the Corporation of the City of London, by their surveyor, served a notice requiring the old party-wall to be pulled down on account of its dangerous condition. It was arranged between the parties that each should pay one-half of the cost of the demolition, and there was no dispute as to this point; but Mr. Apperley proposes to rebuild the party-wall on its old site, and served the usual notices under the Act, seeking to make the *News of the World* Company contribute one-half of its cost. The latter refused to contribute, as they had already rebuilt their premises in a very substantial manner on a new wall standing entirely on their own land. They stated that the proposed new party-wall will be of no use whatever to them, and that they do not intend to use it in any way, and they relied on this fact to relieve them of any liability in the matter. The matter was referred to arbitration, and the Arbitrator in his award gave it as his decision that each party should pay one-half of the cost of rebuilding the party-wall. Against this decision the *News of the World* Company appealed, and the case came on under the title of Fifoot v. Apperley, as stated above. The Judge, after hearing counsel on both sides at some length, upheld the decision of the Arbitrator, and, in giving his judgment, said that notwithstanding the fact that the *News of the World* Company did not intend at present, or (so far as they now knew) at any future time, to use the wall, nevertheless there was nothing to prevent them doing so, and he did not think it was arguable that they should have this swinging right unless they contributed to the cost of the wall. He also said that if the matter were decided otherwise, he could easily conceive the case of a similar thing being done

through sheer spite, thereby imposing a great and unnecessary burden upon the adjoining owner, although there was, of course, no suggestion of anything of the kind in this case.

WATER SUPPLY AND SANITARY MATTERS.

BURLEY.—The new works of water supply provided by the urban district council of Burley-in-Wharfedale were inaugurated on Saturday. Under the Parliamentary powers which they obtained in 1899, the urban council have added to their reservoir storage a capacity of 31,950,000 gal., a bold increase on the old storage of just under 1,200,000 gal. The new works on Burley Moor include the High and Low Lashaw reservoirs, holding respectively just over 12,000,000 gal. and 2,000,000 gal., and the Carbottom reservoir, which has a capacity of 17,210,000 gal. To supply these and the smaller reservoirs of the old system, the water rights have been secured over a gathering-ground of 300 acres, thus increasing the daily yield from 50,000 gal. to 231,650 gal., after allowing for the necessary compensation water. The works and land have cost £17,000, and a further £3,000 was expended on obtaining Parliamentary powers. Mr. Malcolm Paterson was the engineer, and Thomas Smith, of Bingley, the contractor.

DERWENT WATERWORKS UNDERTAKING.—Considerable progress is being made with the huge waterworks undertaking in the Peak of Derbyshire, in which the towns of Sheffield, Leicester, Nottingham, and Derby are chiefly interested. The complete scheme includes five reservoirs, which will impound nearly 11,000,000,000 gallons of water, gathered from a watershed which has an area of about fifty square miles, and capable of yielding an average of 50,000,000 gallons of water per day. One-third of this, however, will be restored to the river by way of compensation, leaving two-thirds available for public use. At least 2,000,000 tons of stone will be used in building the dams, which are to be of solid masonry from the foundations up, and the aggregate cost of the works, including filter-beds, aqueducts, and pipe lines, will be 47,000,000 sterling. Of this total sum the Derwent Water Board will be responsible for £5,800,000, which covers the cost of building the five reservoirs in the Derwent and Ashop Valleys, making fourteen acres of filter-beds at Bamford, carrying an aqueduct thirty miles long to Ambergate, making a small service reservoir at this point, and laying a pipe line to Sawley on the Trent. The cost will be shared by the authorities interested in the undertaking in proportion to the amount of water they take. Leicester is to have 35.72 per cent., Sheffield and Derby 25 per cent. each, and Nottingham 14.28, subject to certain claims of the counties of Derbyshire and Nottinghamshire. Sheffield will carry off its allowances by the aqueduct through the hills to the Rivelin reservoir, Leicester and Nottingham will convey their respective quota from Sawley, and Derby will help itself by a pipe line from Ambergate. The cost of the subsidiary works is roughly estimated at about £1,100,000, thus bringing the total very near to seven millions sterling.

TODMORDEN.—At Todmorden, on Friday, Mr. W. O. E. Meade-King, M.L.C.E., an inspector under the Local Government Board, held an inquiry relative to the town council's application for sanction to borrow an additional £10,543 for sewage disposal works at Sandbed, Eastwood, and £2,300 for an excess of expenditure on the Walsden sewers. The council wish to make some deviation from the scheme originally proposed and sanctioned. Under that scheme the sewage was to be treated on the "International" system by precipitation and filtration on a small portion of land; now it is proposed to adopt the bacteriological treatment of sewage without land. Including the river diversion, the sum sanctioned for the original scheme was £28,780; the council now ask for £39,323. There was no opposition.

The Wetherby Rural District Council have accepted a scheme of sewerage and sewage disposal for Bramham township, prepared by Mr. E. J. Silcock, M.I.E.E., of Leeds, and have ordered the plans to be sent to the Local Government Board, together with an application for sanction to a loan of £4,000 in order to carry out the works.

The foundation-stone of the new Children's Home for Rotherham, which is to be built on the cliffs two miles to the south of Filey, was laid on Monday by Lady William Cecil, of Hunmanby Hall.

Mr. Walter E. Bush, A.M.I.C.E., of the engineer's office, Birmingham, has been appointed borough surveyor and inspector of nuisances to the corporation of Sudbury. Mr. Bush has been assistant surveyor to the South Norwood and the Bromley (Kent) Urban District Councils, and resident engineer on the Orpington and Crofton main sewerage works. He has also acted for some years as engineer and manager for Messrs. Cooke and Co., of Westminster.

Our Office Table.

A NEW work of some account in its bearing on the amenities of Yorkshire cities and towns has, says the *Yorkshire Post*, been initiated by the president and members of the Leeds and Yorkshire Architectural Society. It is the founding of an approximation to a School of Architecture in which students may fit themselves for the responsibilities of the architectural profession and prepare for the preliminary, intermediate, and final examinations of the Royal Society of British Architects. Owing to the lack of finances the promoters are unable to proceed by the direct path that has been taken in Manchester and Liverpool, where chairs of architecture have been endowed at their respective universities. To endow a chair at the Yorkshire College for the same purpose would require a capitalised sum equal to £400 or £500 per annum. It is impossible at the present time to raise this amount of money, and under the circumstances the society will utilise evening classes at the Yorkshire College and the Leeds Institute in conjunction with classes that are to be specially organised at the Institute, and at the society's headquarters, to cover the whole course of architectural study. Until Mr. Butler Wilson took office as president of the Leeds and Yorkshire Society in 1901, there was no facility for organised study offered the student in the district. Broadly stated, engineering subjects of which the practical architect must have knowledge are to be taught at the Yorkshire College, the preliminary course of design is to be taken at the Leeds Institute under Mr. F. Musto, and the advanced course of design will be taken at the society's rooms.

The newspaper reports as to the damage occasioned at Dover by Thursday night's storm were, it is satisfactory to state, grossly exaggerated. As a matter of fact, no portion of the permanent work of the National Harbour suffered injury. Up to the present time about a mile and a half of the permanent work has been well advanced on the east and west, and about one mile remains to be completed on the south side. The sections which have made most progress are the easterly arm and the extension of the Admiralty Pier. Neither of these structures suffered in the smallest degree during the late gales, nor was injury of any sort done to the contractor's plant erected thereon. The damage was exclusively confined to the carrying away of one bay or span of an isolated stage, 50ft. long and 120ft. wide. This was temporary scaffolding, occupying part of the site of the eastern entrance to the National Harbour. Here the contractors had built a detached stage, consisting of 24 piles of Australian blue gum wood, upon which rested a superstructure of lattice girders. This temporary structure was destroyed. It was insured at Lloyd's, and instead of £70,000, as was reported in the daily Press, the damage will be about £7,000, and it is not likely to result in any prolongation of the period allowed for the execution of the whole work. The machinery on the temporary staging consisted of two cranes, used for the extension of the scaffolding, and not for setting the permanent work.

A SCHEME for dealing with ecclesiastical dilapidations will, at the instance of the Bishop of Hereford, be brought before archidiaconal conferences at Hereford and Ludlow shortly, with the idea of making the scheme a diocesan one. At the conferences it will be proposed that the incumbents' obligation should be met by an annual insurance payment, that this payment should be based on the rateable value of the property, that the parsonage house and premises and the glebe property should be dealt with and assessed separately, that present incumbents have the option of coming under this scheme when established, and that every incumbency be brought under it on the next vacancy, and that all properties be certified as in good repair when brought under the scheme. On the subject of management, it will be proposed that all insurance payments be made to the Ecclesiastical Commission, and that the rate of payment be fixed and revised from time to time by that body. The business of surveying and carrying out dilapidation repairs, it is proposed, should be conducted by diocesan committees, and each committee should appoint its own working surveyor. It is thought that the Ecclesiastical Commissioners should provide the funds necessary for dilapidations from the insurance fund or otherwise in case of need, and that they be asked to

consider the possibility of remitting the annual insurance payment in the case of all beneficiaries under £100 a year and of reducing the rate of payment for all beneficiaries between £100 and £200 a year.

CONSIDERABLE resentment has been aroused amongst manufacturers in the Potteries by a communication which has been received from the Moscow agent of Twyford's (Limited), sanitary ware makers, of Cliffe Vale, exposing a practice which is said to be doing English trade much harm. Messrs. Twyford's agent writes:—"Russian manufacturers are now 'badging' their wares with the British coat of arms, the name of the firm in English, and the word 'England.' Could not English firms send a petition to the Minister of Commerce or Finance of Russia, or to the English Consul General, to stop this nuisance, as the general public, and even plumbers, are cheated nearly every day? I think it would be worth the trouble." The matter will receive the attention of the North Staffordshire Chamber of Commerce.

A NUMBER of those interested in the question of dust prevention on the public highways attended on Monday a demonstration near Windsor, where the roads had been prepared by the sprinkling of a solution mainly of petroleum and water, the process admitting of petroleum being watered down indefinitely. A section of the road was sprinkled with the mixture by means of an ordinary watering cart. The inventor claims that a road sprinkled with a 15 per cent. solution will not require further attention for several weeks, and that the subsequent applications need only consist of solutions containing from 10 per cent. to 3 per cent. of Westrumite. The cost of the solution is £10 per ton, and a 5 per cent. solution, which is stated to be sufficient to keep an ordinary road free from dust, can be applied at a cost of half a farthing per square yard, and if that operation be repeated from five to eight times a year, the road, it is claimed, will be continually free from dust. In addition, it is pointed out that the present cost of road watering is saved. A stretch of road at Ballyshannon was sprinkled with the mixture for the Gordon-Bennett race. Although several weeks have elapsed, a telegram received from Ireland announced that the treatment of the road was still apparent, that there was a complete absence of dust, and that the continuous rains had tended to improve the sections. On Monday racing motor-cars were sent over a section of the Old Windsor-road that had been treated with a 13 per cent. solution, and there was a complete absence of dust. When once the cars passed the treated portion of the road they raised clouds of dust, which quite enveloped them. The invention is receiving a trial by the borough of Windsor. The solution cakes dust, and gives the road a smooth cement-like surface. It is not in the least slippery, and it is stated that a road so treated recovers much more quickly from the action of rain.

In connection with these experiments an official report on the oiling of roads, penned by Mr. James W. Abbott, has been issued by the United States Department of Agriculture, which possesses considerable interest. Mr. Abbott made a personal investigation of oiled roads on the Pacific Coast, and has collected valuable data concerning their history, wearing properties, cost, and methods of construction. He gives illustrations of good roads built on loose sand, and reports that there is no reason why equally good results cannot be obtained anywhere in rural districts, provided the water can be kept away from the foundations of the roads so that they will remain firm and not give way beneath the surface crust in the spring. It is important to notice, however, that reliance must be placed in an oil with an asphalt base, or one specially prepared by dissolving asphalt in crude oil. This will increase the cost of the work, but the expense is warranted by the improvement which oiling will effect in dusty highways. All petroleum will lay dust, but asphalt is required to bind the loose materials together. The report contains full directions for applying the oil, and describes the apparatus used for the purpose.

THE Stoke-on-Trent board of guardians received at their last meeting a report from a committee who had met Mr. Lynam, formerly architect and surveyor to the board, with regard to accounts received from him amounting to £1,966, and comprising in their principal items the preparation of various schemes for remodelling

the workhouse. They stated that Mr. Lynam contended that the charge of £688 for a second set of plans (a set for an amended scheme) was quite justifiable, but, as he was extremely anxious to avoid increasing the friction, he expressed his willingness to settle the account for £1,300. This offer the committee recommended the board to accept. The report was adopted, the chairman, Mr. Wilkinson, remarking that Mr. Lynam had met the board like a gentleman.

SOMEWHAT better results are reported by the Associated Portland Cement Manufacturers, the profits for the year ended June 30 last being some £33,000 larger than those of the preceding twelve months. The company is again able to pay its preference dividend in full, but nothing is distributed on the £1,925,000 of ordinary share capital, which has been dividendless ever since the inception of the combine in 1900. This year, however, £25,000 is placed to general reserve fund, and the carry forward increased from £1,500 to £6,900. The directors continue to lay all the blame on "importations of cheap foreign cement." These importations are certainly unfortunate for the combine, but the builder has benefited, and there are those who declare that if the company would abandon costly and antiquated methods of production and adopt those employed by foreign producers, whose chief crime is cheapness, both the shareholders and the public would be gainers.

MR. W. J. NICHOLS, of Chislehurst, has conducted a party of antiquaries over the curious caves and passages there concerning which he recently read a paper before the British Archaeological Association. Starting from the only entrance in the face of the cliff, close to the railway station, the visitors walked through about four miles of passages formed with considerable regularity, measuring about six to ten feet in height, with occasional dips of less height, and a breadth of three to twelve feet. The walls in the solid chalk show numerous marks of the pick, and curve in slightly at the top, with a flat roof formed by the under surface of a stratum of chalk. There are alcoves or side-chambers with beehive-shaped domes, daises or altars, side passages ending in *cul-de-sacs*, and in one of these labyrinthine walks is a well of very fine and true work and reaching to about 300ft. in depth. Conjectures have been widely hazarded as to the object of these workings, but nothing at present is definite beyond the facts that Roman pottery and worked flints have been found.

A RECENTLY-ISSUED report of the United States Census Office gives some results of the working of the tramways in the Republic during the year ended June 30, 1902. In the twelve months previous to that date the length of line has increased by 188 per cent., and the number of passengers carried by 138 per cent. The most significant and suggestive feature of the return is that the miles of line worked by animal power have decreased 95, by cable 51, by steam 76 per cent.; while those worked by electricity have increased by 1,637 per cent. There are 997 companies (no tramways being worked by municipalities) with 16,648 miles of track or route, and 22,589 miles of single line; 352,947 and 260,121 passengers are carried yearly per mile of route and of single line respectively, and the car mileage was 65,942 and 48,599 per mile of route and of single line respectively. The nett profit is, however, equal to only 1.44 per cent. on the capital, and the cost of construction is placed at £25,096 per route mile, and £18,495 per single mile.

EXTENSIVE works of street improvement are being carried out by the borough council of Stepney. In the Mile End district Globe-road has been widened from 20ft. to 40ft. at its southern half; Hatford-street and Ely-terrace have also been widened; Brantridge-street has been opened up with the Mile End-road at a cost of £1,522; and Stayners-road widened and diverted. In Limehouse a project is on foot for widening the Commercial-road near the Britannia Bridge; the improvement of Narrow-street is in progress. Wapping Wall is also being widened at a cost of £2,127, while property has been acquired at a heavy cost for widening Three Colt-street. In addition the London County Council is widening Mansell-street to a width of 50ft. to accommodate the Tower Bridge traffic.

ON Saturday evening, Messrs. William Cowlin and Son, contractors, of Bristol, entertained their office staff and managers to dinner at the Wine-street Restaurant, to celebrate the approaching

marriage of Mr. Charles Cowlin. The chair was taken by Mr. Frank Cowlin, the head of the firm. After the loyal toasts, Mr. William Kidwell proposed the health of Mr. Charles Cowlin. Mr. W. H. Collett, the head of the office, then presented to Mr. Cowlin, on behalf of the employees, a silver salver and an illuminated address containing the congratulations of the employees. Mr. Charles Cowlin returned thanks. The toast of the visitors was responded to by Mr. Frank Wills, Mr. Arthur Scull, and Mr. E. Turner. To the chairman, Mr. W. Kidwell presented an illuminated address on behalf of the employees. Mr. Frank Cowlin, in returning thanks, alluded to the great development of the firm in the last ten years, mentioning that now they gave employment to about 1,000 men. A musical programme was carried out, and the evening was brought to a close by the singing of "Auld Lang Syne."

THE city council of Puebla has presented to the well-known English architect, Mr. C. J. S. Hall, a resident of that city, a gold medal in a handsome case, as a recompense for his services as designer of its new municipal palace. The medal bears on one side the coat-of-arms given to the city by Carlos V. of Spain, and on the other appears, beautifully engraved, this inscription: "El Ayuntamiento de la Ciudad de Puebla, al Arquitecto Charles J. S. Hall, Premio por su Proyecto del Palacio Municipal." It will be remembered that the Royal Institute of British Architects of London elected Mr. Hall unanimously as a Fellow of that body in recognition of the architectural merit of the above building, which has also been praised by such artists as Mr. Sylvester Baxter, Antonio Rivas Mercado, Adamo Boari, the Baroness von Heyking, Professor Rowe (of the University of Pennsylvania), Mrs. Alec Tweedie, and many other Mexicans and foreigners of distinction.

ONE of the notable exhibits in the United States Building at the Louisiana Purchase Exposition will be furnished by the geological survey. Professor A. H. Thompson is now in the valley of the Salt River, gathering data which will be used in the construction of three models that are to demonstrate the Government's irrigation plans to the uninformed public of the Eastern States. One model will be of the 250ft. Tonto storage dam; the second will include a section of the box canyon below the dam, and the third, showing a typical irrigated area, will be a close reproduction of Mesa City, on a scale of 2in. to the mile. The last model will show every house, farm, and orchard, as well as all the ditches, with their headgates and power-works. Mesa City is a model irrigated community. Originally settled by the thrifty Mormons, the holdings are small and the utmost use is made of every acre. It is situated on a fertile tableland about eighteen miles east of this city.

THE ARCHITECTURAL ASSOCIATION.

COURSES OF INSTRUCTION IN ARCHITECTURE.
The Day School will open on MONDAY, September 28th, at 9.45 a.m. Intending pupils are requested to forward their names to the Secretary as soon as possible.
The Evening School also opens on the same date at 6.30 p.m.
A pamphlet containing full information as to the Classes and advantages of membership may be obtained upon application to the Secretary, at 36, Great Marlborough-street, London, W.
H. P. G. MAULE, } Hon. Secs.
H. TANNEA, Jun., }

The seating accommodation of St. James's Church, Woodside, Horsforth, Leeds, has for some time past been found too small, and a new aisle has now been completed which has an additional seating capacity for 130 persons. Other alterations have been made, including a new oak pulpit, elaborately carved. The total cost has been £2,000. The dedication service was held on Tuesday evening, the preacher being the Bishop of Ripon.

The City Temple, internally redecorated at a cost of £7,000, with an additional stained-glass window—in loving memory of Dr. Joseph Parker, depicting St. Paul's farewell to the Elders at Ephesus (Acts xx.)—was reopened on Sunday. A conspicuous alteration is the removal of the platform that formerly fronted and partly hid the varied coloured marble pulpit, the gift of the City Corporation, which is now fully visible.

A stained-glass window has been placed in the Grange Congregational Church, Sunderland, as a memorial to the late Mr. Thomas Steel, J.P. It has for its subject "The Ascension of Christ."

The Coventry Corporation adopted, on Tuesday, the design of Messrs. Wailes and Strang, of Newcastle-on-Tyne, for the memorial tablet to Volunteers and others from the city who served in the war in South Africa. The tablet is to be fixed in the lobby of St. Mary's Hall.

Trade News.

WAGES MOVEMENTS.

THE LABOUR MARKET IN AUGUST.—The monthly memorandum prepared by the Labour Department is based on 3,442 returns—viz., 2,130 from employers or their associations, 1,248 from trade unions, and 64 from other sources. It reports that the general state of employment in August continued to show some falling off as compared with the preceding month, and was worse than a year ago. In the 226 trade unions, with an aggregate membership of 561,946 making returns, 30,751 (or 5.5 per cent.) were reported as unemployed at the end of August, as compared with 4.9 per cent in July, and 4.5 per cent. in the 222 trade unions, with a membership of 551,565 from which returns were received for August, 1902. The mean percentage of unemployed returned at the end of August during the past decade was 4.3. In the building trades employment continues moderate, with little change as compared with a month ago and a year ago. The percentage of unemployed trade-union members among carpenters and joiners was 2.9 at the end of August, compared with 3.3 at the end of July and 2.8 a year ago. The percentage for plumbers was 7.1 at the end of August, compared with 6.7 at the end of July and 6.1 a year ago. Employment in the furnishing and wood-working trades shows some little change compared with a month ago and a year ago. The percentage of unemployed trade-union members at the end of August was 4.0, as against 3.9 in July and 3.6 in August, 1902.

BRADFORD MASONS' DISPUTE.—Sir William Markby, the arbitrator appointed by the Board of Trade at the request of the Mayor of Bradford in reference to the dispute which occurred in the early part of the year between the operative masons and the employers, has now given his award. The men were desirous of abolishing a clause in the agreement of January last year to the effect that no strike or lock-out shall be permitted where the dispute rests solely on the question of the employment on the same job of society and non-society men. The arbitrator quotes the agreement arrived at in January, 1902, pointing out that for some reason the part of this agreement relating to the employment of society and non-society men was not embodied in the rules; but it has been assumed by both parties that this part of the agreement is subject to alteration under Rule 9, which provides for alteration in the rules on due notice being given, and notice was given accordingly by the masons in January, 1903. The parties could not agree, and the matter went before the Board of Conciliation, but no decision was come to, and it was then determined to refer the matter to arbitration. His award is that the words, "And, as to the employment on the same job of society and non-society men, it is understood that no strike or lock-out will be permitted where the dispute rests solely on this question" be struck out from the agreement of January 14, 1902; but that in other respects that agreement shall stand.

GLASGOW.—The dispute in the sett-making trade in the Glasgow district has been settled as the result of a compromise. Five months ago the employers proposed a reduction of wages to the extent of about 30 per cent. The men, refusing to accept this, came out on strike in April. A short time ago the Aberdeen Quarrymasters' Association intimated that unless the dispute was settled within a fortnight from the date of that notice a general stoppage of work would take place. The subsequent negotiations have resulted in the acceptance by the men in the Glasgow district—which embraces Airdrie, Kilsyth, Condorath, &c.—of a reduction equal to about 15 per cent. They returned to work on Monday.

NEWCASTLE-ON-TYNE.—The Town Improvement Committee of the Newcastle Corporation have received a deputation representing the Labourers' Union with reference to the wages allowed to their members for demolishing houses on the Quayside for the purpose of widening that part of the city. At present the corporation were paying 5½d. per hour, whilst for similar work, it was declared, the Master Builders' Association of the city were paying 6½d. per hour. On the other hand, the city engineer intimated that he was informed 5½d. per hour was the standard wages. The committee are making inquiries of the Builders' Association, to ascertain definitely what really is the amount paid by the members for the work.

The new naval barracks now in course of erection at Portsmouth are the largest quarters on shore in the world, and cover an area of 62½ acres. They will provide accommodation for 6,200 men, and have cost half a million sterling.

The Battersea Borough Council have decided to provide a hall and committee-rooms for public meetings at an approximate cost of £2,640.

CHIPS.

The parish church of Great Chart, Kent, is in course of restoration, under the direction of Mr. Reginald Blomfield. The contractors are Messrs. Clark, of Lenham.

At a meeting of the Stratford-on-Avon Town Council, on Tuesday night, the tender of Messrs. Cox and Harris, builders, of that town, was accepted for the erection of a public library in Henley-street. This building, it will be remembered, has been a fruitful source of controversy in literary circles during the present year. Mr. Carnegie has made a payment on account of £1,000.

Mr. Alfred Gilbert, R.A., M.V.O., has removed from St. John's Wood to Bruges, where he is to open a school of art. He has taken a disused factory, which yields, besides studios, living accommodation for about 300 pupils. He proposes to do all his own work in the presence of his classes, and not only sculpture, but painting and a number of handicrafts, are to be taught under his personal supervision.

The London and North-Western Railway Co. will open, on Oct. 1, the new passenger and goods line from Leigh via Plank-lane to Wigan. This new route will not only open up a large colliery district, but will enable the Leigh people to travel to and from Blackpool in half an hour less than it now takes by the ordinary route via Tyldesley and Wigan.

The death took place at Darlington, on Sunday, at the age of 75, of Mr. T. W. Hobson, cabinet-maker, who was well known as an expert in ecclesiastical screen work.

Mr. M. K. North, M.I.C.E., held an inquiry on Friday at Harrogate relative to the application of the town council to borrow £7,000 for the provision of additional filter-beds and pumping plant in connection with the corporation waterworks at Iron-gate Bridge-road and Harlow-hill.

At Fredensborg Castle, where her Majesty Queen Alexandra is now a guest, a septic tank installation has recently been laid down by the Scandinavian Septic Tank Co., a branch company of the Septic Tank Co., Ltd., of Westminster.

On Thursday the new Wesleyan Sunday-school erected on the Birmingham-road, Stratford-on-Avon, at a cost of £2,000, was formally opened.

The inauguration of a statue of Rénan in the market-place of Tréguier, in Brittany, his birth-place, took place on Sunday. The monument, which is the work of M. Jean Boucher, depicts Rénan seated, in a pensive mood, at the age of about sixty years. Behind the statue is the figure of Minerva, holding above his head a laurel wreath.

A new organ, erected by Messrs. Hele and Co., of Plymouth, was dedicated by the Bishop of Exeter at St. George's Church, Tiverton, on Friday. The organ, which has been erected at a cost of £500, is a three-manual one, containing 30 stops. The case is of pitch-pine with oak fittings.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2542.

FRIDAY, SEPTEMBER 25, 1903.

INDEPENDENT PARTY-WALLS.

ONE of the restrictions of modern town building is that imposed on all building and adjoining owners by the statutory enactments relating to the repair, pulling down, and rebuilding of party structures which are defective. The obligations incurred on these persons are set out in the London Building Act in Part VIII., sections 87, 88, 89, 90, &c., to which we need not refer. Only the back and front walls of a street building can be treated as the owner likes; the other sides, often, the largest in superficial area, are division-walls, and are held in common between the owners, so that practically more than half the exterior of a street house is lost for architectural effect, and as the back wall counts for little, the external design is really limited to one narrow frontage as a rule. We cannot perhaps therefore be surprised if the façade of a street building receives so much attention as it does in the way of ornament, as it is the only part of the structure visible to the public, although a good deal of the design becomes thrown away in narrow city streets. But we are not now discussing the architectural question, but the structural one of party-walls. The question is whether the owner of a building in a street who rebuilds his premises is justified in erecting an entirely new wall or walls on his own land, or is compelled to give the usual notice under the London Building Act, and to rebuild the wall as a party-wall between the properties, each party paying one-half of the cost of rebuilding? An interesting case we reported in our Legal Intelligence column last week, which is of considerable importance to building owners. The owners of premises in Bouverie-street, a publishing company, rebuilt their offices in 1898, and, instead of giving the usual notice under the London Building Act of 1894, and rebuilding the old party-wall which divided their property from the next, they built an entirely new wall situate wholly on their own land. Eventually the adjoining owner followed the example of the publishing company by pulling down his premises, with the intention of rebuilding them; but the surveyor acting under the Corporation of the City of London served a notice requiring the old party-wall to be pulled down, on account of its dangerous condition, and it was agreed between the parties that each should pay one-half of the cost of demolition. There was no dispute on this point; but the adjoining owner proposed to rebuild the party-wall on its old site, and served the usual notices under the Act, and sought to make the company contribute one-half its cost. This they refused to do, as they had already rebuilt their premises in a substantial manner on a new wall standing on their own land. The proposed new party-wall, they argued, would be of no use to them whatever, that they did not intend to use it in any way, and they relied on this point to relieve them of any liability. The question was thereupon referred to arbitration, and the arbitrator in his award decided that each party should pay one-half of the cost of rebuilding the wall. Against this decision the present appeal was made. The judge, after hearing counsel on both sides, upheld the decision of the arbitrator, and in giving his judgment said, "That, notwithstanding the fact that the company did not intend at present, or at any future time, to use the wall, nevertheless there was nothing to prevent them doing so, and he did not

think it was arguable that they should have this swinging right, unless they contributed to the cost of the wall. He said if the matter was decided otherwise, he could conceive the case of a similar thing being done through sheer spite, thereby imposing a great and unnecessary burden upon the adjoining owner, although there was no suggestion of anything of the kind in this case." We do not see how any other legal decision could have been come to in justice to the adjoining owner; for if any building-owner had this power the definition of the term "party-wall" in the Act would be rendered meaningless and the sections inoperative. The definition is now (a) "a wall forming part of a building, and used, or constructed to be used, for separation of adjoining buildings belonging to different owners, or occupied or constructed or adapted to be occupied by different persons; or (b) a wall forming part of a building, and standing to a greater extent than the projection of the footings on lands of different owners." But there has been a great deal of controversy over the meaning of "party-wall," and it has been used in different senses. (1) A party-wall may mean a wall of which the two adjoining owners are tenants in common, and this is the primary meaning to be attached to the term; (2) it has been used to mean a wall divided into two longitudinal strips, one belonging to each of the adjoining owners; (3) it may mean a wall which belongs entirely to one only of the adjoining owners, but subject to an easement or right in the other to have it maintained as a dividing wall between the two tenements, and in this sense it is often used in the Building Acts; (4) it may mean a wall divided longitudinally into two moieties, each of them being subject to a cross easement in favour of the owner of the other moiety. According to the first of these definitions, the provision of the Act appears to have been framed. But it is a question of "user" chiefly; the Building Act is intended to limit the acts of private owners for the good of the public, to prevent the spread of fire chiefly, and for the purpose of physical separation, and these are the main objects which the sections of the Act are intended to promote. The rights of ownership are not the main consideration. Before the Building Act came into operation, the dividing walls of buildings in streets were of various thicknesses and materials; the buildings of Old London have revealed stud-work and plaster, brick-nog partitions, and walls of all kinds of construction, which rendered easy the spread of fire. It was with the object of providing substantial party-walls of brick of minimum thickness that the Building Act was framed. So long as there was a good thick wall between the houses the requirement is practically met, and therefore the definition No. 3 above would be sufficient to meet the case. But for economical reasons a wall-constructed equally on both sides of the dividing line between two premises was naturally regarded as the most desirable arrangement, in which the adjoining owners are tenants in common, a wall bonded throughout its thickness. A wall divided longitudinally into two strips, one belonging to each of the tenants, or as in definition 4, would necessarily imply two walls placed close together without a through bond, and therefore defective in strength. In the case of one strip or half belonging to each owner, it would be possible for one of them to be taken down or tampered with at the expense of the remaining moiety.

If we consider for one moment the question of an independent wall on land belonging to one of the parties and exclusively his own, in an architectural sense there is something to be said in its favour. It can be built without any reference to the requirements of the adjoining owner, and if such a wall is carried up to a greater height than the roof of the

adjoining building, it can be treated architecturally and become an integral part of the building. Thus it can be divided into panels of brick or stone or of different coloured materials. The cornices and stringcourses of the front face could be returned along the sides if space allowed, for it would then become an external wall. But in such a case the adjoining premises must also have a party-wall of its own, which would have to be built, presumably, at the sole expense of the owner. There would then be two thick walls where one of a certain thickness would be sufficient. The Building Act interposes to prevent such a double wall being erected, by providing certain scheduled thicknesses for walls of different heights, and requiring each party to pay one-half of the cost of building it. Thus the cost is equally divided between the adjoining owners without sacrifice of room. The construction prescribed by this Act renders such a common party structure perfectly safe. Thus it is required that no bond timber or wall-plate or wooden beam or joist shall be built into any party wall nearer than 4in. from the centre line of party-wall, that every bressummer bearing upon such a wall is to be carried by a templet or corbel of stone or iron, tailed through at least half the thickness of wall. Again, if premises were divided by two-walls, each belonging to the adjoining owner, the walls so built could not be termed party-walls in the sense defined in the Act, and there would be a frequent violation of these requirements by builders. There are obvious reasons for upholding the statutory provisions, and for not sanctioning any building owner to construct a party-wall on his own land independent of his neighbour, with the object of evading his obligation to pay for his neighbour's party structure when it was found necessary to rebuild it, even though such party-wall was not intended to be used by the building owner. The case we have quoted will be a useful reminder to all owners of property who have obligations to fulfil, and who intend to rebuild their premises.

FRENCH AND ENGLISH METHODS OF DESIGN.

OCCASIONALLY it is useful to compare our methods of professional practice with those of other countries, as we are so apt to become insular in our habits and prejudices. We need not surrender our nationality by taking advantage of improved methods and adopting those of other countries, but we are more likely to lose our distinctive habits by accepting blindly and without consideration the styles of other nations. For instance, there may be a good reason for adopting a system of education which has worked well in Germany, France, Switzerland, and the United States, though for us to adopt their fashions of dress and tastes in building and other matters is a very different matter. The latter step implies that we have no tastes of our own, for these express the national sentiment, while the methods of education do not. To take an illustration more appreciable to our present argument, we can adopt a foreign system of construction and manufacture with advantage without committing ourselves to the particular style of architecture which is associated with it. In the engineering industries it has been irrefutably shown that we are behind America and other countries. The system of training engineers which prevails in the States is more logical and discriminative than our own, for tradition, family connections, and money are less influential; the pupil is encouraged to develop his natural abilities or particular bent, instead of being made to undergo the routine of an office in which almost everything is drummed into the pupil but the right one; that for which he has shown ability. In America capital is made out of the natural

talent of the pupil. The engineering assistant is even better looked after. The youth who, after paying a large premium to a London firm to learn the business, is cast adrift after his term of articles has expired, finds often his talents appreciated and adequately rewarded in the United States, where he is put to his right occupation, and obtains a higher wage. The American method of teaching engineering is more systematic than our own; the college training is perfect. Even in architecture, the improvement manifested in all that concerns design as applied to buildings has been remarkable. Not so long ago American architecture, if it could be so called, was a reproach, a bad imitation of our 19th-century revivals; now the buildings of the great cities vie with our own in architectural treatment and good taste. The architects in the States have learned much from the Mother Country as well as from French methods; indeed, many of their leading men have been trained in the Paris ateliers, and are imbued with French methods and tastes. The report published not long ago, drawn up by leading men in the profession on French and English design and draughtsmanship, revealed some of our shortcomings, the lack of the study of composition and modelling, light and shade, which can only be acquired by the study of the plan of a building. Greater attention is bestowed in France on the composition of the plan of the building. The instruction in architecture given at the Ecole des Beaux-Arts, Paris, was described by the late Mr. Arthur Cates in the *Journal* of the R.I.B.A. These consist of competitions (*concours*) in architecture, divided into analytic exercises (studies of details) and composition; competitions in scientific subjects; the study of ornament and modelling. The competitions in composition or design comprise sketch, plan, section, and elevation of a given subject. These embrace all that is essential in architectural composition. In draughtsmanship the French architect, though less given to picturesque effects, is more technical and correct, especially in the art of shading and perspective, as these are subjects which form a special branch of the course of instruction.

Architectural design in France is regarded from a rather different point of view than it is in this country. It is looked upon more as a whole—an *ensemble*—than in a piecemeal manner. The Englishman is so essentially practical and detached in all he does that he can seldom bring himself into the frame of mind to view his building as a whole—an artistic composition subserving useful ends—he rather regards the useful ends as distinct and without reference to the design in its completeness. He studies his plan first, often without reference to his elevations, which are made to agree afterwards; or he thinks of his elevations, and makes his plan fit just as he pleases. The plan and other drawings are studied too much separately. The French architect is more of a scholar and an artist than a practical man. An interesting paper published in an American professional paper some time ago gave an instructive insight into the mode of designing adopted in France. We quote the following by the author of the paper, M. Alb. Allain:—"When an architect is consulted with regard to a work of architecture, he should be able on the spot to design mentally one or even several projects of the structure in question, in accordance with the intentions of the person who wishes to build. This mental design makes it possible for him to propose at once to the owner, one or several types of structure for the proposed building. When the first general understanding has been arrived at, the architect makes a sketch, a rough tracing with the pen, indicating only the *ensemble* and the principal divisions, serving as a basis for the execution of the real design or the final project. The architect should be able with his sketch to give an approximate estimate of the expense,

based on the cost price per mètre (or foot) of surface and per floor for a structure of the character ordered. When client and architect agree on the *ensemble* of the structure and its essential points, the architect starts on the execution of his project. He first draws his design with pencil, and on a reduced scale. The simplest and most commonly used scale is one decimètre or two decimètres, in which one or several of the divisions as units of length are taken. If it is understood that one centimètre, two centimètres, five centimètres represent one mètre measured on the ground, we say that the design executed is on the scale of 0", 01, of 0", 02, of 0", 005 per mètre. The custom in France is to draw the plans at 2 centimètres per mètre." We may usefully remark on these observations that the French designer begins by grasping mentally the design of the structure as a whole or in thinking out one or more schemes, before he makes any sketch-plans of his proposal. This mental process of design should, of course, be in accordance with the intentions of the client. It is not the gift of everyone to be able to conceive mentally the kind of structure required, but the exercise of the faculties is not impossible. The first thing the average architect does when he gets a commission to design a building for any particular purpose is to consult examples, to search through plans and designs of buildings that have been erected for the same objects; such reference is not often conducive to invention. The English methods of teaching the profession do not aid the mind of the designer; they rather stifle inquiry and original thought by interposing precedents and traditional types. These have a restraining influence upon him. The course adopted in France is systematic. The architect would have to invent his plan from his own brain—he would not have recourse to other plans; but such ideal architects are rare. The plans are first drawn in pencil, and these are chiefly constructional, consisting of the axes of walls and rooms, and are drawn in interrupted lines—a series of dashes and dots, and dotted lines are employed to indicate the concealed lines and outlines. Afterwards the plan is drawn in with ink, and the pencil lines erased. Our way of proceeding is less methodical in its procedure. The architect makes a rough sketch to scale of the requirements, which, if approved, is at once drawn out, and the elevations prepared to suit. But probably there are several alterations required which completely upset the original design, and render a new scheme necessary, or a fresh set of plans, a system which does not bind itself to ideal compositions, or to that study of *ensemble* which is necessary from an artistic point of view. Again, it is stated when the French client and architect agree on the *ensemble* of the structure and its essential points, the architect begins to execute his project by drawing his design in pencil on a reduced scale. The English practitioner is supposed to proceed in much the same way; but many hindrances prevent. In the first plan, the architect and client do not trouble about an *ensemble*; the latter considers chiefly his requirements and the cost. And these are prevailing. Then, few architects are in the habit of drawing the first design to a reduced scale, unless the work is of an important kind, requiring several studies. Many adopt for small buildings a scale of $\frac{1}{16}$ in. to the foot, which can be traced and made to answer for contract working drawings.

The same writer says: "To express the design the architect must represent in form of a plan, a profile, and an elevation, the building which is to be erected." These three drawings are necessary to express the general design or *ensemble*. Great importance is attached to the plan, as on its composition the merit of the work depends. But in this country we do not study plan as the French architect does. We look upon it as merely a

matter-of-fact draft of the arrangement; as a necessary and practical means of showing the requirements, without any reference to its *composition*. It is the composition of the plan, by which we mean its general outline and grouping, that the French consider mainly. "The skill of the architect," he says, "consists in combining the convenience of the interior connections of the necessary exits with a regularity which is always desirable; but to this regularity, to symmetry, to the uniform correspondence between all the parts of a plan he must not sacrifice everything else. It is necessary above all that the general and special arrangement agrees with the needs and the use of the building." All this we can cordially agree with. The plan must subserve the wants of its occupants; but at the same time it should be put into shape. There ought to be observed, where possible, axial arrangements and a correspondence of parts externally if a regular composition is desired. But composition in plan must be suggested by the choice of idea, on which the form of the building or its physiognomy and character depends. Profile is not less necessary as a part of the *ensemble*, but is often left to chance by many architects. The French architect considers it as an important part of his composition. Having satisfied ourselves with a plan that will work, and elevations that will fit and will look well, we do not trouble; we draw our sections without any attention to profile. But how much depends on it? We may see its neglect in the unsightly profiles and skylines of many of our London buildings. We do not study our sections so carefully as we might; they are too often looked upon as irksome constructional details that can be drawn after all the other drawings are prepared, just for the purpose of contract. There are two main parts described by M. Allain in his paper—the design of a building in plan, profile, and elevation, and the representation of the ornaments which form its decoration, which are drawn to a large scale or full size. With these designs the architect has to furnish estimates and specifications. In the descriptive statements the French architect specifies, as we do, the materials, requirements, and processes necessary. The "*devis descriptif*" may be regarded as the specification of work; the "*devis estimatif*" concerns the cost of each detail. The "*devis*" has to show in a precise manner the perfected building in its *ensemble* and its parts, the nature of the materials to be used, their quality, the processes to be used to insure perfect execution, &c. In fact, the "*devis*" specifies everything necessary; the architect also describes in it the arrangement and decoration of the several rooms shown in the drawings. A methodical classification is necessary to avoid overlapping, and the "*devis*" is divided into divisions of the trades, as in our specifications. Each trade or class of work is thus described; but the most careful attention does not insure always correctness against error. These involve, as in our practice, variations in the amount agreed upon. The writer says, "To avoid this, in order not to be bound irrevocably, we often suppress the '*devis estimatif*,' and retain only the '*devis descriptif*,' after the owner and his builder are sufficiently posted regarding the cost. On the whole, in France, the work of the architect consists in furnishing the project, involving a more or less large number of designs, and the '*devis*.'" He is also responsible for damage caused by faulty design or specification. The composition of plan is one of the distinctive merits of a great architect, and, as the author whom we have quoted, remarks, "A good architect need not consult any work on architecture, because, no matter what problem may be before him, he will at once see, in his mind's eye, a standard plan of his building. I mean to say, the disposition and the

distribution proper for the building, the best order and the best arrangement so far given to such and such details, and to its *ensemble*. If by chance the architect should not have the standard plan in question present in his mind, he should be advised to look it up, either in technical books or in the works of his fellow architects. There are standard plans for all kinds of structures, from the standard plan of a labourer's cottage to the standard plan of a church, from the standard plan of a theatre to the standard plan of a hospital, and we may lay it down as a principle that the architect before composing the plan of his building must know the standard plan of that kind of building, and must not let it pass out of sight—unless he is a man of genius. Of course, he must not copy it; besides, it might be that the standard plan would not answer sufficiently well the particular wishes and taste of his client. . . . In one word, there must be in the mind of the architect a sort of mysterious collaboration between the architect's own conception, the requirements of his customer, and the standard plan. From this triple collaboration the composition of the plan of the building will originate." The author goes on to describe the order adopted in France in designing. This corresponds practically with our own: the plan of the ground floor is the first, then that of the first floor, then those of the other floors, and last the basement plan and upper part; two sections are made, as with us, and finally the elevation of the front. The remarks on the design of the elevation and the details are perhaps more true of French modern architecture than of English. The French architect is a skilful decorator; he studies ornament specially, but is apt to exaggerate its importance. Reliefs without motive, senseless balconies one above another, columns on the balconies, brackets suspended anywhere, are noticed as common mistakes in the French façades. Instead of which the ornament should be based on motives derived from the structure of the building. And yet ornament is the complement of architecture of a certain class. There are two classes of architects in France—those who content themselves with the ordinary and humbler kind of structure, and those who devote their attention solely to important works.

THE ARCHITECTURAL ASSOCIATION'S ANNUAL REPORT.

THE annual "brown book" of the Architectural Association has just been published. It contains much information as to the curriculum of the classes, a list of members, a syllabus of meetings, &c. The report of the committee for the session 1902-1903, states that the 56th session of the Association, which ended on May 31, 1903, has been one of successful progress in every respect. The membership again shows an increase, and at the close of the session numbered 1,512; 136 new members were elected, 15 rejoined, and the number of losses by death, resignations, and other causes amounted in all to 29. The committee regrets to record the deaths of Professor T. Roger Smith (hon. sec. 1859-60, and president 1860-61 and 1863-64), a constant and active friend of the A.A. to the last, and Messrs. A. G. Morten and J. J. Trego. The question of new and adequate premises has again received earnest attention, and a proposal having been made by the council of the Royal Architectural Museum, Tufon-street, Westminster, that the Museum and School of Art, together with the existing leases, should be transferred to the Architectural Association, the committee considered the proposal in all its bearings, and subsequently by the unanimous vote of members at a special general meeting held on November 24, 1902, the committee were empowered to accept the offer with thanks, and to carry the matter to completion. The affairs of the Royal Architectural Museum were in due course wound up, Mr. William Pain having been appointed liquidator. The committee found it quite impossible to arrange for the Westminster School of Art to continue its valuable work at the Museum, as the Architectural Association would require all the accommodation for its own needs. Arrangements were made to allow the school to continue until the end of June, 1903, thus entitling the school to the full grants payable by the Technical Education Board and Board of Education, formal possession being taken on July 2, 1903. The committee desire to acknowledge very gratefully the services of Mr. Maurice B. Adams, who for many years acted as hon. secretary of the Royal Architectural Museum and Westminster School of Art, and with whom the proposal originated that the premises should be transferred. The lease of the present premises at 56, Great Marlborough-street, terminated on Midsummer Day, 1903, but arrangements have been made for occupation to be continued until Lady-Day, 1904, by which date it is hoped the Architectural Association will have removed to Westminster. Negotiations are in progress for a lease of 999 years in place of the existing leases of 73 and 23 years respectively. Important alterations were found to be necessary to adapt the premises and obtain the full advantages of the site. Mr. Leonard Stokes has been appointed architect, and the tender of Messrs. Holloway Brothers (£8,440) has been accepted. Contributions are invited towards the Building Fund, as a large amount is still required in order to carry out the alterations and provide the necessary equipment.

The progress of the Day School has been very encouraging both in regard to numbers and work. The term of Mr. Arthur Bolton's appointment having expired, the committee have appointed Mr. H. P. G. Maule as his successor. General regret was felt that Mr. Bolton was unable to continue to fill this post, which he had held for two years with the best possible results, but private practice compelled him to relinquish the work. The same reason was responsible for Mr. E. F. Reynolds's resignation.

The balance sheet and general income and expenditure account show that the past session has been a satisfactory one financially; in no single instance have the receipts shown a decrease compared with those of the previous session.

The annual excursion, which was organised by Messrs. W. Talbot Brown and A. W. Hennings, took place in July, and was attended by 28 members, Banbury being the headquarters. Two hundred and fourteen individual students attended the studio and evening classes, the numbers showing an increase over the previous year. The classes of design were very successful, and the visitors spent much time in inspecting and criticising the various designs submitted.

SANITARY WOOD BLOCKS IN STREETS.

AT one of the closing meetings of the British Association at Southport, Mr. W. Powell, of Liverpool, read a paper describing the preservation, seasoning, and strengthening of timber. He endeavoured to show how some kinds of timber, at present valueless, might become exceedingly useful; how timber used for structural purposes might be so strengthened as to bear a much greater load or strain; how streets might be cheaply paved with sanitary wood blocks which would neither absorb surface water nor give out disagreeable effluvia; how we might combat the ravages of dry rot; and, finally, how to do all this simply, naturally, and at comparatively small cost. By boiling timber in a thin saccharine solution until most of the air in the timber was exhausted, and then, by leaving the wood in the syrup to cool, a certain amount of sugar was absorbed by the timber, in some cases so much as to cause the timber to sink. After the wood had become sufficiently saturated, it was put into a drying stove and the moisture driven off at a fairly high temperature until the wood was thoroughly dry, ready for immediate use. That process differed from others mainly in the fact that, before drying was attempted, the interstices of the timber were filled in with a viscid, glutinous solution, which took the place of the natural sap and air which the wood had been forced to part with, and so, when the moisture was driven off by stoving, the sugar which remained in the wood acted like a strong binder and held the fibres together, just as cement or mortar bound the stones or bricks in a wall. There were thousands of square miles of land in the States and Canada covered with timber which, at present, was of little commercial value. This class of timber was especially amenable to the Powellising process, and the

results were astounding. Very remarkable results had recently been brought out at Silvertown, where some timber processed showed the following results in increased strength:—Pitch pine from 14 to 32 per cent., white pine from 29 to 39 per cent., yellow pine from 56 to 107 per cent. If this simple process increased the strength of yellow pine from 50 to 100 per cent., then it followed that such timber would be able to bear a corresponding greater strain, or that 25 to 50 per cent. less timber would be required to bear the same strain. The question as to the effect of the process on the flammability of wood—especially of such wood as the pines—has naturally arisen, for many persons imagined that, because sugar was introduced into the timber, it would become more inflammable. A little reflection, however, would show that the reverse would be the case, which, indeed, was borne out by tests. Timber, properly processed, would stand very high temperature in drying, and be all the better for it; but each class of timber naturally required modified treatment in each stage of the process. In all timber, and especially in walnut, oak, beech, birch, maple, mahogany, &c., where there was feather or grain, the process brought out the ornamental character of the wood more distinctly; and thus even some of the commoner woods might be used for ornamental purposes, as the appearances when cut and polished were so much improved. By this simple and inexpensive process it is probable (1) that some varieties of timber not at present merchantable, especially some kinds growing in Canada and the United States, might be made of considerable commercial value, and thus an important addition be made to the world's stock of useful timber; (2) that such timber might possibly furnish an ideal paving block, at once cheap, tough, and sanitary; (3) that the lighter timbers used for structural purposes might be made to bear much greater strain without increasing their weight appreciably, and at the same time be rendered less inflammable and impervious to the attacks of dry-rot; (4) that hardwoods, such as beech, birch, elm, ash, maple, mahogany, &c., had their valuable qualities enhanced, their liability to split or crack diminished, their appearance when polished or varnished much improved; and (5) that timber might be rapidly dried and seasoned, and thus an enormous amount of capital now locked up might be realised.

IMPERVIOUS CONCRETE.

THE great value of concrete in modern construction is a fact beyond any doubt. In our own day the progress made in the manufacture and use of concrete in hydraulic works and building has been remarkable. The variety of its applications has been equally significant;—from foundations, bridge pier, and dock wall construction, it has been employed in superstructures of all kinds, arches and vaults, floors and domical roofs. For sewers, subways, and reservoirs it is now in constant demand as a substitute for brick and masonry. We use it for our fireproof floors, our pavements, and streets. It is now no longer confined to the structures of the engineer, for the architect is constantly bringing it into requisition in a variety of ways. But there are certain questions concerning it that we require to know more about: its imperviousness to water, its action when combined with iron or steel, its fire-resisting qualities, &c. An informal discussion on the subject of "Impervious Concrete" took place recently at the Annual Convention of the American Society of Civil Engineers, a full report of which is given in the last month's *Proceedings* of that Society. The subject for discussion was, "Is it possible to make concrete which will be impervious to water? If so, what is the best method?" The remarks of R. W. Lesley, Assoc. Am. Soc. C.E., show a thoughtful investigation of the subject, the author referring to the valuable researches and experiments of M. R. Feret, Chief of the Boulogne Laboratory of the *Ponts et Chaussées*, an eminent expert of the French Government. The results of his experiments, begun in 1887 and pursued for five years, can only be summarily given in Mr. Lesley's own words: "(1) The strength of mortar made on ordinary public works increases in proportion to the amount of lime or cement therein. (2) The strength increases generally at the beginning of the hardening, in proportion to the size of the sand elements. (3) Mortars made with a mixture of sand containing large and small particles present practically the same advantages

as those where sands of large particles are used exclusively, and should be preferred to the latter.

(4) The porosity of cement mortars varies greatly. It diminishes as the proportion of cement increases. It is much greater when the sand is finer. (5) The permeability of mortar diminishes as the proportion of cement is increased; but reversing the conditions applying to porosity, permeability increases according to the size of the sand grains. Mortars made with sand composed of different-sized particles which themselves have little porosity also very slight permeability." It is also observed that the permeability of mortars submitted to a continuous filtration of fresh or sea water diminishes rapidly with time; and it is recommended to mix mortars to a good consistency by adding too large rather than too small a quantity of water. M. Peret, in referring to the porosity of mortar, observes, the most porous mortars are the least permeable, and the reverse applies to permeable mortars. Permeability is quite different from porosity. The passage of water may be said to free small particles of lime or cement and bring them to the surface, where they produce efflorescence according to the freshness of the mortar. This efflorescence tends to solidify the mortar and form an exterior coating. Tables are given to illustrate by experiment the effect of water passing through the permeable mass, which demonstrate that when water is forced through a mass of mortar, stone-work, or concrete, the quantity that goes through the first hour does not indicate any want of value in the mortar, as the water carries lime particles which close the pores. Each subsequent hour shows a diminished volume of percolation. The tables represent the lessening of permeability by the pores becoming closed by the carbonates of lime. This is due to the limewater attacking the cement and the exposure to the air. It was, indeed, found by experiment that the ratio of the permeability of the mortar increases as the quantity of water increases, or as the filtration through the mass is more abundant. These experiments were confirmed by Durand-Claye, who enunciates the principle that for each class of mortar and sand there is a definite dose of water which corresponds to the maximum of compactness and the minimum of permeability of the mortar. M. Peret, in summing up the subject, says "that in all mortars of granulometric composition the most permeable are those which contain the least quantity of cement. Of all mortars of the same richness, but of varying granulometric composition, those which contain very few fine grains are much more permeable." They are more so, he found, where the coarse grains predominate; and the minimum permeability is found in mortars where the proportion of medium size grains is small and the coarse and fine grains are equal to each other. These conclusions are what we might have expected, and also the other deduction referred to by Mr. Lesley—that neat cements under pressures of 75 to 200lb. per square inch showed no permeability to water in 28 days, but that with sand the permeability increased as the sand was increased. In fact, the mixture of 1:1 gave better results than the 2:1 samples. Another conclusion drawn from experiments made by Messrs. Hyde and W. J. Smith, noticed in the *Journal of the Franklin Institute*, is that all cements are not permeable to water, at least for thicknesses of not less than 3in., while the mortars are all permeable, the amount increasing with the pressure, and decreasing with the age of specimen. They show also that a conduit of *béton-agglomère* composed of sand and cement was practically impermeable. The porosity of mortar depends on the voids of three kinds, those existing between the grains of sand or pozzolana and not filled up by the cement or lime, those due to the air which adheres to the grains, and those left by the evaporation of the water used in the mixing. Each kind of void was investigated, and the conclusions come to were that cement mortars are less porous than those made of hydraulic lime and sand; that cement mortars made with coarse sand are less porous than those made with fine sand; that neat cement mortars are more porous than those mixed with sand, &c. The author of the paper proves indeed from these experiments that the permeability of mortars, so far from being a consequence of their porosity, is, in fact, almost inversely proportional to it.

We cannot refer here to other investigations. The general drift proves that fine sand mortars are less permeable than those of coarse sand, and that permeability decreases as the proportion of

cement increases; that neat cement is the least permeable of all. "That concrete made with 700lb. of Portland cement, 1 cubic yard of mixed sand, and 1½ yard of small gravel, and moulded in the shape of a hollow cylinder, with a shell of 2½in. thick, was impermeable under a head of water 13ft., while a mortar made with the same amount of cement and sand, but without gravel, and moulded in the same shape, was somewhat permeable."

The permeability of concrete under high water pressures has also been carefully investigated. The pressures were 20, 40, and 80lb. per square inch, and the time of test two hours. Two brands of Portland cement were used, and mortars of 1:1, 1:2, 1:3 of sand were made. Several of these mixtures were impermeable to water at the pressures named. All the specimens made with the first proportion were impermeable, and some of those of the second class. In short, the experiments showed that neat cement mortars are the least permeable, and that those with fine sand are less permeable than mortars with coarse sand. Mr. Lesley's theory, based upon experiments and upon those of Peret, indicates that the least addition to cement mortars for the purpose of making them impermeable, according to theory we have noticed, would be "to add to the concrete at the time of mixing a certain proportion of hydrate of lime, or, in other words, the ordinary slaked lime of commerce." Such an addition, the author says, does not injure cements or mortars, nor cause expansion, and does not decrease their strength. This lime would form a substance which would be carried by filtration and close the pores, form efflorescence or stalactites on the surface. Other papers are contributed on the subject, to which we may refer. Mr. J. James R. Croes, past president of the society, observes that it is easy to make concrete impervious to water, which is a different thing to making it impenetrable. The latter requires only the application of an impenetrable coating to the surface. A small mass of concrete can be made impervious to water; but the difficulty is in uniting a number of such small masses in such a manner that the joint will be impermeable also. There is a practical difficulty in securing the proper combination of the materials to render the mass impervious to water. Like masonry, concrete made in different quantities and mixtures is liable to have void spaces, and thus to render a large mass of concrete pervious to water. The author refers to the application of the Sylvestre process, invented sixty years ago, or a mixture of soap and alum applied to the surface of brick. The pores are filled up by the addition of these ingredients, which were mixed up in the mortar itself, and the chemical action which takes place in the interior of the mass seals up the pores and renders it impervious. Mr. J. W. Schaub, another member, remarked that all that was necessary to make concrete impervious to water is to wash the walls inside with grout, or two coats of neat cement grout. This coating on the inside of a cistern will hold the water in the cistern, but will not affect the outside. To render both sides impervious it is necessary to apply the grout to both the inside and outside. For greater pressure than 10ft. head, grout is not sufficient, and asphalt applied hot with a mop until a coat of ¼in. covers the grout is declared to be satisfactory. We may refer to other contributions on this interesting subject, which has a very practical interest for the profession generally.

"BUILDING NEWS" DESIGNING CLUB: AWARD OF PRIZES, 1902-3.

"ALL BRITISH" wins the first prize easily for his work during the last session of our Club: "Solo" comes in thoroughly well as a good second, and "Brassey," who has maintained a sincere endeavour from start to finish, takes the third place. "Icele" ranks fourth, "Last Man In" fifth, and "Red Rose" sixth.

The first prize of £10 10s. is accordingly given to "All British," Mr. Philip H. Ellis, 20, Shakespeare Villas, Nottingham. The second prize of £5 5s. falls to "Solo," Mr. S. J. Waring, 16, Highfield-street, Leicester; and the third prize of £3 3s. to "Brassey," Mr. F. E. Tabberer, The Holt, Leicester. Hon. Mention is accorded to "Icele," "Last Man In," and to "Red Rose."

The record of the above successes during the nine monthly competitions held from October, 1902, to June, 1903, is as follows:—"All

British" was five times first, once second, and three times third. "Solo" was once first, four times second, twice third, and once sixth. "Brassey" was once second, once third, once fourth, once fifth, and twice sixth. "Icele" was once first, once fourth, and once sixth. "Last Man In" was once first, once fifth, and once sixth. "Red Rose" was once second, once third, and once fifth. "Clay Pipe" took a first place once, but this was the sole occasion on which he came in among the first six. "All British" took a place in each of the nine contests.

The subjects set for the past Session were these:—

- A.—An Artist's Town House.
- B.—A Country Vicarage.
- C.—A Hill Side Church.
- D.—A Village Market Hall.
- E.—A Roundhouse in the Country.
- F.—A Co-operative Store for a Village.
- G.—Sanatorium for Consumptives.
- H.—Tavern and Cottages on a Goose Green.
- J.—A Band Stand and Refreshment Pavilion.

SESSION 1903-4.

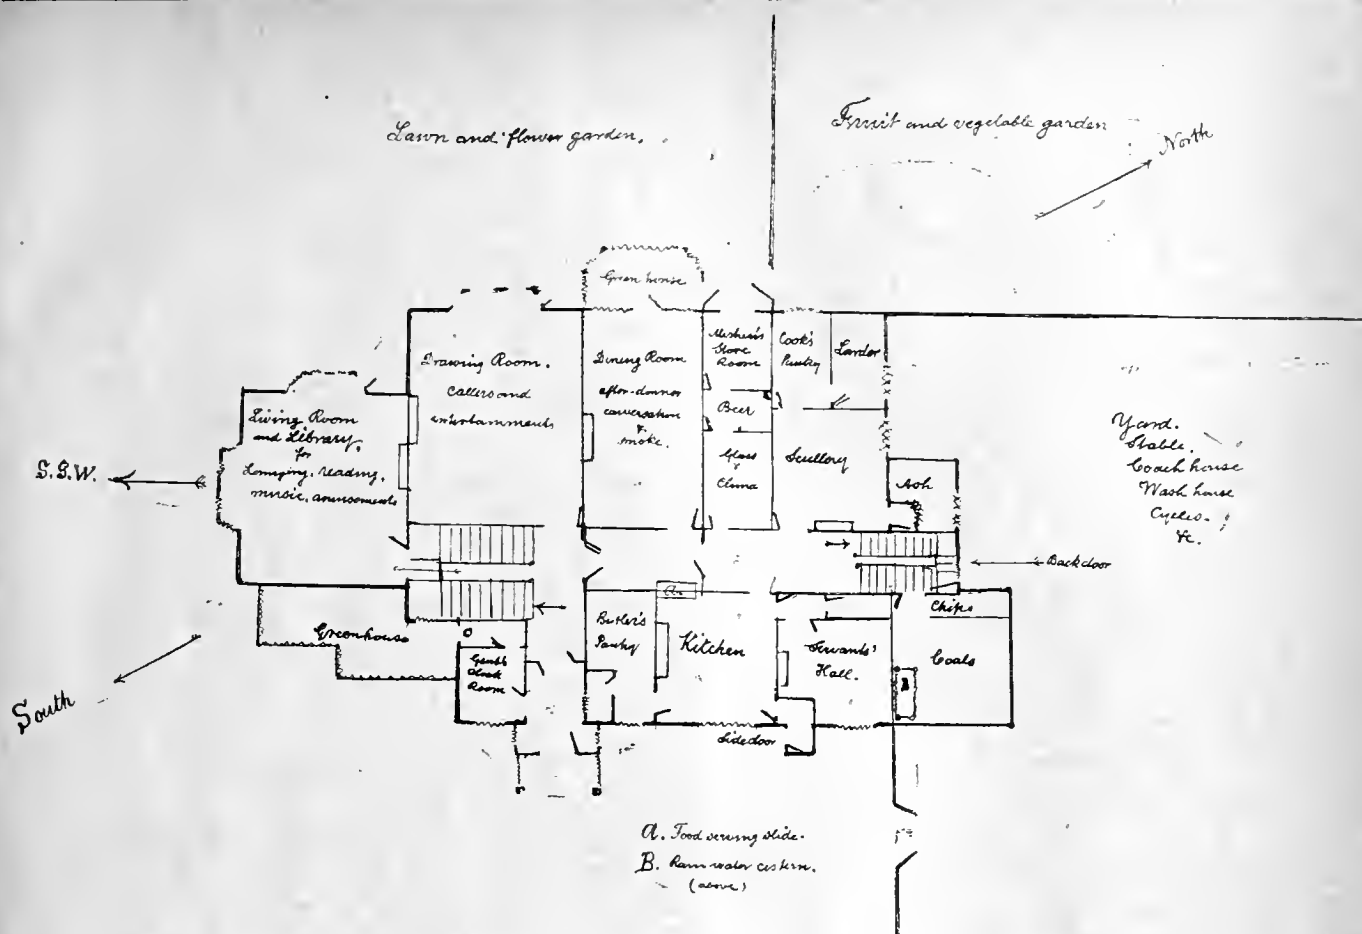

FIRST COMPETITION.

A.—A Secondary School for 150 boys, on an open site, with a frontage towards the south-east, facing the high street of a country town, in a freestone district. The playground will be at the rear, and the land falls 1 in 12 from S.E. to N.W., commencing at a distance of 20ft. from the street footway, where the site is level. The building is set back 15ft. from the street. The accommodation is to comprise an assembly-hall 50ft. by 25ft., and five classrooms, about 22ft. by 20ft. each. A chemical laboratory for twenty students, a preparation-room, and a balance-room; a physical laboratory, available as a lecture-room, about same area as the chemical laboratory; an art classroom for twenty students, and a small life classroom—both these to face north. A head-master's room, and a common room for the other teachers. Cloakroom for pupils, and latrines, lavatory, &c. Covered playground under part of the building, which is to be on two floors, above the ground level. Materials stone, and stone-slate roofs. Style simple and picturesque. Scale for the drawings 8ft. to the inch. A plan of each floor, two elevations and section, with a sketch view, which may be small. Drawings to be sent in so as to arrive at the office not later than October 31 next.

CLUB RULES FOR 1903-4.

The following are the rules to be observed by all who wish to join the club:—

1. Drawings to be sent within 28 days after the publication of the particulars of each subject.
2. One or more subjects will be given every month, from which a competitor may choose.
3. The drawing to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 24in. by 18in., unless an exception to this rule is named when the subject to which the deviation applies is set. No washes or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts may be shown in ruled "etching," or blocked in. The scale to be used will be given with each subject.
4. Drawings to be forwarded, prepaid, unmounted, by post, care being taken to pack the roll so that the drawings are not crushed through the post.
5. On entering the class (which may be done at any time) each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing, as a guarantee of good faith, the *nom de plume* the author intends to adopt being holdly marked on the front of each separate drawing.
6. Prizes of £10 10s., £5 5s., and £3 3s. will be awarded to the best series of designs. Our decision to be final.
7. Before awarding the prizes any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student. The same prize cannot in future be awarded more than once to the same student, and those who have taken the first prize cannot compete again.
8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.
9. A critical notice of the designs sent in of

DWELLING HOUSES.—SUGGESTED PLAN BY DR. JOHN W. HAYWARD.

each series will be given in an early issue following the receipt of the drawings. All drawings are returned when done with.

DWELLING-HOUSES.

By JOHN W. HAYWARD, M.D., late Vice-President of the Liverpool Architectural Society.

THE purpose of a house being to provide shelter and to protect from vicissitudes of the weather, it should be designed and constructed so as to serve these purposes without being prejudicial to health. The main purpose of a house being to live in, its principal feature should be a good family living-room. This should be large and designed for comfort, and should face the midday sunshine. As sunshine is the essential of health and comfort, the living-room should be so placed that its occupants will be exposed to the sunshine for as many hours of the twenty-four as possible. For this purpose it should face—or at least its principal window should face—the south, or rather the south-south-west, as shown on the accompanying plan. It should have two windows, one to the south-south-west and the other to the west-north-west. It is not a valid objection to this that sunshine spoils the colour of the furniture; the promotion of the health and comfort of the occupants is of much greater importance than the preservation of the colour of carpets, &c. This room should afford convenience for most of the requisites for comfort, instruction, and amusement, such as sofas, easy-chairs, books, musical instruments, &c., and perhaps for the proprietor's smoking. There should be a separate room for meals, the family to be called to these after the servants have laid the table and brought in the meal, and be able to retire to the living-room as soon as the meal is over, leaving the servants to clear the table. This will contribute to privacy, and to the avoidance of exposure to draughts from the kitchen. The family should not need to go into the drawing-room after meals. The dining-room should be simply for meals and for after-dinner conversation, and smoking. For callers and for social entertainments there should be a capacious drawing-room; it is not necessary this should have much sunshine. The drawing-room is not a room to live in; it is rather a night than a day-room, and

much sunshine would spoil the colours of its furniture. Still, neither the dining nor the drawing-room should be exposed to the cold of the north. These three rooms should be near to, and easily accessible from, one to the others; and they and the bedrooms should be efficiently ventilated. The living and the drawing-room should be easily accessible from the entrance-hall. The dining-room should be near to and easily accessible from the kitchen, and yet it should be protected from kitchen odours. Near to the dining-room there should be a small room for the mistress's stores, and another for the glass and china, and one for the daily wine and beer. There should be a lavatory with gentlemen's cloakroom on the ground floor; a ladies' cloakroom, and a lavatory with family bathroom on the first story; also a children's bathroom with lavatory on the second story; the water for these bathrooms and lavatories being heated in the boiler behind the kitchen fire. On the second story there should be also a housemaid's room and a bathroom, with w.c. for the servants, the water for these being heated in the boiler behind the scullery fire. In connection with the kitchen boiler there should be two cylinders, one placed in the family bathroom and the other in the children's, for the purpose of warming the rooms and drying the towels. There should be a small room for airing the newly-washed linen and for drying rain-wet clothes and shoes, &c. Clothes from the wash are not always sufficiently dried, and if wet shoes be sent into the kitchen they may be over-dried. This room may be heated by the cylinder in connection with the scullery fire, supplemented by an open fire or other means. There should also be two other small rooms, one to serve for the master's studio and to hold his deeds-safe, and the other for the mistress's boudoir and the jewelry-safe. There should, perhaps, be another to serve as a sewing and governess's room. The front door should be easily and quickly attended to from the kitchen and from the butler's pantry, the servants being usually in one of these. The scullery should be easily accessible from the kitchen. The kitchen and the cook's pantry should be at the north end of the building. The larder should be to the north or north-east, with the object of keeping cool and preserving the food supplies. As it is a gross mistake to have the family living-room

anywhere except to the sunshine, so it is to have the larder anywhere except away from the sunshine. There should be a servants' room near the kitchen, and a cook's store-room. There should be as many bedrooms and closets as possible, and as many of the bedrooms as possible should have a dressing-room, in order to keep out of the bedroom the offensive and unhealthy exhalations from the towels, sponges, flesh-brushes, &c., and for other purposes. And perhaps the master and mistress's bedroom should have two dressing-rooms and space for two beds. The room on the second story—that over the family living-room—should be appropriated for the children's living-room; that is, it should be the nursery, in order that the children may have the health-promoting and invigorating influence of the sunshine. The billiard-room should be easily accessible from the main staircase, and it should be on the second story; it should be thus placed in order that it may be lighted from above and be used as the principal smoke-room. The ground-floor space is required for the living, dining, drawing, and other domestic rooms; and, besides the smoke nuisance, there are other objections to its being near the drawing or dining-room. A supply of rainwater should be provided for. This may be done by a spout run along underneath the eaves to cisterns at the north end of the building. If carried on an ornamental ridge, this may be made quite a decorative feature of the exterior, even notwithstanding the presence of gables, &c. For the town water it will be well to have two cisterns—one to supply the family, and the other the domestics' part of the building. Any or all of the bays for windows may, if desired, be carried up to the bedrooms, or as exterior ornamentation. A small greenhouse at the south-south-east corner will help to protect the living-room from the cold.

ON BUILDING TIMBERS.—XXXVII.

OAK AND OTHER HARD WOODS.

THE concluding sentence of article XXXIV. on p. 233 of the present vol. of the BUILDING NEWS is, "All pollard oaks are hollow-hearted trees." To prevent misunderstanding it is necessary to observe that this statement must be taken in connection with the context, for if

isolated, it is not accurate, there being many apparently sound pollard oaks growing in private parks all over England. To lop the top of any tree is to "poll" it, and one so treated is then described as a "pollard"; it may be an oak, elm, ash, or any other tree. Pollard oak is well-known in the trade to be a dark brown richly figured wood, which is always cut into veneer, for the reasons already stated, its use at present being almost wholly confined to panelling furniture of a fairly good class; but architects can find no richer or more suitable wood in colour or grain amongst any imported for panelling first-class joinery where the stiles and rails are of oak. Pollard oak veneer with the best figure and darkest colour is invariably that cut from the wood of very old trees much stunted in growth and hollow-hearted. The statement referred to above may therefore be made more explicitly in this way. "All dark-brown, richly-figured, pollard oak veneer is obtained from hollow-hearted trees, and such wood is used for ornamental purposes only." It was always a maxim with old foresters that "Oaks made Pollards is quite wrong; for while the slow shoots are growing, the body of the tree is rotting." Removing large branches in polling a tree almost invariably leads to a decayed "heart," so that any statements as to the soundness of a pollard oak of any size should be received with caution. When English oak timber was in greater demand than it is at present, various schemes were elaborated by amateur woodmen for producing a great weight of good merchantable wood in a short time, and at a small cost. High cultivation and manuring were suggested as means to attain the desired end, and these were fairly successful; but the timbers so produced were not as durable as that grown more slowly in suitable soil and in the ordinary way, for culture had the effect of making the annual rings wider, and the wood softer than that which was grown in a wild or natural state. The oak of Central and Southern Europe, which grows faster than English oak, is softer and milder in working than the latter, and the oak grown in the Welsh and Scottish mountains is much harder and closer than that grown in England; but it seldom attains one-fifth the size of the best English trees. There is a well-marked difference between the hardness and durability of Scotch Highland oak and English oak, where both are subjected to much "wear and tear" and exposure to the weather, and North of England oak is harder than that grown in Herefordshire and farther south, for all slowly-grown trees of the same species yield harder, heavier, and more durable wood than trees which make timber rapidly, no matter from what causes, and these may be climate, soil, and exposure to light and air, whether in hedgerows, parks, or forests. All trees which yield building timber thrive best and produce the most valuable woods when they grow in soils and under climatic conditions natural to the species. Those which have propagated themselves in ancient woodlands and forests have a rate of growth conditioned by their surroundings, and any treatment which tends to develop the wood unduly or abnormally must injure the quality of the timber. Whatever tends to interfere with the natural development of the tree by increasing its growth will tend to the formation of annual rings of a more open and porous character, and this will eventually produce wood more liable to suffer on exposure to the weather. It is a well-ascertained fact that slowness of growth is necessary to the production of close-textured oak, and if the natural growth of an oak tree is accelerated by culture or otherwise, the timber will be injured in quality in direct proportion to this acceleration. It was reckoned by experts more than 150 years ago that oak peeled of its bark standing, and left so for two or three years, had its sapwood hardened like heartwood; but this hardening in no way added to the durability of the sapwood when it was subsequently exposed to the weather unprotected by paint. It was found that casks made of English oak lasted twice as long as those made from Norway oak, when it was largely imported, for the latter was so porous that "if you put a splinter at the end of a stave a foot or more long, and blow at the contrary end, it will sputter like a piece of cane, if the grain runs straight and there is no knot between." English oak is too close in the grain and too dense to allow water to pass through it in this way. The structure of coniferous wood, that of all the pines, for instance, is simple and regular, being made

up of small fibres or tracheids, which have walls marked with "bordered pits"—pores, in fact, which are covered by thin membranes which serve as passages for water between the adjoining cells or tracheids. In all the coniferous woods the pith rays (medullary rays) and resin ducts are insignificant, and the general texture of the wood is fairly uniform; in the oak, however, though the same arrangement of heartwood, sapwood, and bark, the two former showing well-defined annual rings, is found, the minute structure of the two woods is very different. The wood of oak is what botanists know as being "ring porous"; the wood of all Conifers is "non-porous," and that of the walnut, beech, maple, poplar, birch, and some elms "diffuse porous." In the first there are numerous pores visible in a cross-section of the wood without a magnifier—in fact a thin section looks like a fine sieve; in the second no pores are seen in a cross-section even under the microscope, whilst in the last there are numerous pores, seen with a magnifier, scattered through the annual rings without classification as to size, as in the "ring porous" woods, where there is a distinct stratum of large pores collected together in the spring wood. The pores of the oak and chestnut are the hollow spaces of vessels which have been cut across at right angles in making transverse section of the wood; there are no such vessels in pines and firs. When oak is cut tangentially (basted) the grain seen is produced mainly by the alternation of the pores of spring and summer wood in each ring; whilst in the pines the corresponding tangential "grain" is produced by bands of the darker and lighter, summer and spring, woods of each ring. The medullary rays of oak appear large and conspicuous in transverse and radial sections, but there are several smaller rays of the same kind which can only be seen when magnified; these rays form about one-sixth to one-fourth of the whole wood. The medullary rays in the chestnut (*Castanea*) are much smaller than in the oak; indeed, in some varieties they are hardly visible. This wood is frequently mistaken for oak, and it was formerly split into laths and worked up into the framing of barns and roofs, where it proved quite as durable as oak. Some old authorities assert that for building fences or paling it is preferable to oak. An old writer says of the chestnut, that its sapwood is "whiter, the heartwood browner, and the grain broader than in the oak, by which three signs it is known from the wood of that tree. The reader of these articles is not likely to confuse this chestnut with *Asculus*, or horse-chestnut (known in America as "Buckeye"), for they are in wood and foliage two very different trees, so unlike indeed are they that Linnaeus placed the *Castanea* in the same genus with the beech. Later botanists have, however, restored its ancient name, which is taken from a town in Thessaly, about which it grew in great abundance. The *Castanea* is usually known as Spanish chestnut here, either because it came from Spain originally, or because the well-known nuts are brought from thence. Some say the tree is indigenous, and Evelyn was of this opinion, for he says he had a large barn near London, entirely built of this timber "which grew not far off." In the reign of Henry II. (1154-1189) which, marked the close of building in what is known as the "Norman style, for William of Sens laid the foundation of "Early English" at Canterbury in 1175, a forest of "noble and large" chestnuts grew near London on the north side; and in the same reign a tithe of all "his chestnuts" in the Forest of Dean was given by the King to Flexley Abbey. Miller says chestnut was formerly in greater plenty in England than of late years, "as may be proved by the old buildings, which, were for the most part of this timber; and there are decayed old chestnuts in the woods and chases about London, particularly Enfield Chase." Another writer, Martyn, denies that chestnut was so extensively used in building, and suggests that the supposed chestnut was, after all, oak "of inferior quality." The most remarkable tree of this kind in England was one which grew at Tortworth, in Gloucestershire, in 1150; it was known as the "Old Chestnut of Tortworth." In 1720 it was measured about 16 ft. in diameter at 6 ft. from the ground, and in 1820 it was supposed to be quite one thousand years old!

The Tortworth chestnut was, however, supposed to have been a fraud, for it may originally have been several trees, and one authority asserted the trunk was actually made up of two trees joined together! Another famous chestnut

was the Castagno de Cento Cavali on Mount Etna; in 1770 it measured 20 ft. in circumference; the Castagno del Galea girthed 76 ft. at 2 ft. from the ground, and there was another of nearly the same size known as the Castagno del Nava. The great size of these was due to the soil—a rich volcanic ash. Whether oak or chestnut was used in framing the roof of Westminster Hall is a question the attempted solution of which has afforded much innocent amusement to some persons, authorities on the subject; but a decision in this matter which is likely to be accepted by all parties as satisfactory is as far off as ever. The writer suggests a compromise—viz., that one-half the timber is oak, the other half chestnut, and the whole good, durable stuff, fully up to the specification.

Dealers in home-grown timber profess to be able to distinguish an oak tree which is shaken when it is in vigorous growth, for in such case a rib or longitudinal ridge will be seen along the trunk, or a crack on some part of it. Experienced men say that oaks from a clay subsoil without drainage are nearly always shaken, whilst those standing on dry ground are generally sound. The reason for this appears to be that, as clay holds water, the roots, which are in it, take up more than can be discharged by the leaves, and this superfluous sap makes its way out of a crack or cracks forcibly made in the trunk. When the sap has been discharged for a sufficiently long period it forms a rib, and by this such defective trees may be discovered. Hollow trees have generally a solid ring of sound wood left, so that one may be more valuable for building scantling than another which has a solid but shaken trunk. As seasoned English oak is sometimes wanted and is not always easily obtained, the following experiences of old workmen in this wood may be of use. A cooper had a quantity of green oak which he had just cleft into staves, and, having a large churn to make in haste, he was advised by a lath-render to boil the green wood in his hoop copper. This he did, and they turned the water black as ink. He now dried the staves for a few weeks and worked them into the churn, and "they never swelled or budged," but remained as they were worked, "for when staves are boiled they will become very pliant, and twist almost like soft leather." In the dockyards planks were bent in hot sand; but as this sticks to the wood and injures the workmen's tools, it is not a desirable way to bend wood. Another cooper soaked his staves in a large cask of water for four days, changing the water once, and then dried them in the air; this process answered as well as if the wood had been a year seasoning. Green staves boiled for an hour in two waters can be worked at the end of a fortnight if they are dried in an oven; or in summer by the sun. The sapwood of oak boiled and dried in this way was found to be quite sound after fifty years' use. Oak sap laths were bound in bundles and set out in the weather for a year; treated in this way they lasted more than 100 years, but if they are used without seasoning rot will set in at once, and the wood will be destroyed. Master joiners in "the good old times" had a maxim which is still acted on—viz., that "the strength of the work is the decay of trade," so they sometimes painted green oak, with the result that even where it was heartwood it decayed in a few years. Oak posts charred at the ends in the ground will not last as long as posts not charred, for the fire shrinks the wood all round along the medullary rays, where the fire does not "char" the fibre, and water soaking into the cracks soon destroys the posts. All old writers on the use of English oak, who consulted coopers, lath-renders, and carpenters are unanimous in recommending that oak cut to the scantlings required should be soaked in running water for two weeks, and then dried. The effect of this would be to remove the soluble matter in the sapwood, and thus make it more durable.

Returning to the foreign hardwoods imported for building or furniture, Padouk is the next in alphabetical order. It is a deciduous tree known to botanists as *Pterocarpus dalbergioides*. The heartwood is bright red, streaked brown and black; the sapwood a greyish colour and very narrow. The pores of the wood are filled with resin. It changes colour when exposed to the light, and the rich reddish-brown tinge becomes a clayey-looking brown something like teak. The staircase hand-rail and dado at 45, Fenchurch-street are of Padouk. The tree is a native of the Andaman Islands. It furnishes a good furniture wood,

and is used for parquet floorings. The grain is open and rather coarse, with strong figure. It is much used in the United States for Pulman cars. Here it generally sells for about 1s. 8d. to 1s. 9d. per cube foot. A consignment of *Pterocarpus indicus* and *P. macrocarpus*, both inferior yellowish woods, was once sent to London for Padouk; this brought Padouk into disrepute, and prices went down, as the wood was entirely neglected; but the real Andaman wood is now only sent here. Logs up to 40ft. by 3ft. by 3ft. may be obtained; it shrinks little, and does not crack or split in seasoning. Rosewood, Indian (*Dalbergia latifolia*), is a deciduous tree found growing in the whole of the Indian Peninsula, and northward to the Sikkim Himalayas and Forests of Oudh. It is nowhere abundant, and seldom forms more than from 2 per cent. to 3 per cent. of any forest. Some trees show about eight annual rings to an inch; but it takes about 100 years to grow a tree 22in. in diameter. The heartwood is hard, close-grained, dark purple, streaked longitudinally with black, and the sapwood yellow, forming rather a narrow ring. Rosewood is called "Bombay blackwood" in India. When dry, it weighs 50lb. to the cube foot, and sells in London from £10 per ton, or 4s. per cube foot, up to high fancy prices depending on the figure and condition of the wood. The African or Seychelles rosewood, *Thespesia populnea*, is a small tree or shrub widely distributed in Africa, the Pacific Islands, and Tropical Asia. The heartwood is hard, and of a dark brown colour. It is used in India for furniture, gunstocks, &c. SANDALWOOD (*Santalum album*), is a small evergreen tree, the heartwood of which is a yellowish brown, strongly scented, the sapwood being white and scentless. It grows in the dry regions of Southern India, where old trees show, on an average, over nine rings to an inch; at ten years a tree will be about 8in. in diameter, and at forty years it will have attained a diameter of about 32in., breast high. The wood is heavy, weighing 60lb. to the cube foot, and only one half the diameter of the tree is heartwood. The chief sales take place at Bombay, and the Chinese are probably the best customers for it, as they use the wood for coffins. The yearly sales are given as—Mysore 1841 tons, Coorg 102 tons, Madras 75 tons, total 2,000 tons. There is a red sandalwood, *Adenanthera pavonia*, found in Bengal, Southern India, Burma, and the Andaman Islands. It is a deciduous tree, and the wood, which is red, hard, and close-grained, is much used for building and cabinetwork. A West Australian sandalwood, *Fusanus spicatus*, which has a fragrant heartwood, is sent in large quantities to China. SATINWOOD, *Chloroxylon Siccitania*, is a moderate-sized deciduous tree which grows in Central and Southern India and Ceylon. The wood is hard, yellow, cream-coloured, with a fine satiny lustre showing medullary rays as brilliant shining plates on radial sections. Logs sometimes girth from 8ft. to 9ft.; 6ft. is considered to be the best exportable size; but even these would probably be hollow if grown in India. The wood is heavy, weighing about 64lb. to the cube foot. Ordinary logs are worth about 4s. per cubic foot in Colombo; figury wood runs up to 15s. and over. The rate of growth in girth is as follows:—At 20 years, 18in.; 45 years, 36in.; 75 years, 54in.; and 125 years, 72in. Satinwood from the Bahamas, *Anthoxylum Caribbeum*, is brought into England in considerable quantity. Some of this wood is highly figured, very heavy, weighing 56lb. to the foot, extremely hard, not strong, brittle, fine-grained, compact, and satiny. The colour generally is light orange, with lighter-coloured sapwood. The tree itself seldom grows more than 30ft. high, even under favourable circumstances, the diameter at this height being not more than 18in. Porto Rico and Saint Domingo satinwood sell here for about 83d. per super. foot, lin. thick. New South Wales Satinwood, *Daphnandra nivalantha*, is a much larger tree than the semi-tropical variety last described, for it grows to a height of 80ft., with a diameter of 27in. The wood, which is yellow, is not put to any particular use at present. East Indian Satinwood is sold here by the superficial foot, measured by Hoppus's quarter girth, and the contents reduced, allowance being made for split or faults; logs are sold as plain or figured, there being usually about 360ft. superficial in a log. SATIN WALNUT, *Liquidambar styraciflua* (syn. *L. macrophylla*)—common names, Red Gum, Sweet Gum, Alligator wood, Bilsted, and Star-leaved Gum, a tree about 100ft. high and

from 4ft. to 5ft. in diameter. It is found growing in the United States from Connecticut to South-east Missouri and Arkansas, and towards the south from Florida to Texas; it attains its greatest development in the low, wet soils of the bottom lands in the Missouri basin. Satin walnut is hard but not strong; it is a close-grained compact wood of a bright brown colour tinged with red, and though it takes a good polish, it shrinks and warps badly in seasoning. It is used as a substitute for black walnut in cabinetwork. A good deal is also used in ordinary lumber, boarding clapboards, and street pavements. It sells here in boards $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in. thick at 1 $\frac{1}{2}$ d., $\frac{3}{4}$ in. at 1 $\frac{1}{4}$ d., and $\frac{3}{8}$ in. at $\frac{1}{2}$ d. A cube foot weighs 37lb. SNAKEWOOD, *Strychnos nux-vomica*, is a tree found growing in the deciduous forests of India, Central Provinces, Burmah, and Ceylon. The wood is used for fancy cabinet work in account of the fantastic pattern which is seen on cross section. The tree shows no annual rings, and it has no heartwood. It is difficult to work, for although it is close-grained, it is very liable to split, twist and warp. A cube foot weighs about 50lb. British Guiana Snakewood or Letterwood, *Brosimum Aubletii*, is used for inlaying. TEAK, is, for outside work, the most valuable wood known to builders, as it shrinks less, twists less, and is more durable than any other. For all good work the architect should use teak, and teak only, especially in sashes, casements, sills, and other moving and fixed parts of carpentry and joinery where great strength is required. Teak is the wood of a tree known to botanists as *Tectona grandis*; it is of the tribe *Vitaceae*, and the order *Verbenaceae*. It is deciduous, and is found growing in deciduous forests, its chief companion in Burmah being the bamboo, to which it forms a kind of "clear story" by overtopping it. The chief districts in India furnishing teak are Chanda, North Kanara, Wynad, the Anamalai Hills, and Travancore. In Burmah teak is common in the mixed forests of the Arracan Yoma, the Pego Yoma, and the Martaban Hills, the northern limit being about 25° 30' north latitude, where it is found of stunted growth only. Teak is also found in Siam, Cambodia, Cochin China, and the Dutch Indies, Java having at present a considerable area under teak plantation, which will soon become very valuable. Teak would not grow in England, as it requires a mean temperature during the cold season of between 60° and 80°, during the hot season between 80° and 85°, and a mean annual temperature between 72° and 81°. It grows best in a well-drained soil, where it is well lighted and has a free circulation of air all round. The wood is moderately hard, gritty in working. If a splinter enters the finger it will poison it, and give rise to a painful inflammation which will last for days. This is probably due to the oil with which the wood is impregnated. When first cut, the heartwood of teak is a dark golden yellow; but it gradually turns the peculiar brown colour so well known in teak logs and flitches; finally it becomes almost black with age. Teak is not usually felled green; it is girdled as it grows, standing, in order to kill it. When freely exposed to the air and sun after girdling, the wood seasons in a year or two if the trees are of moderate size; the smallest girdled are about 23in., larger trees require a much longer time. Like trees in our climate, teak makes one ring annually, the period of rest with it being the dry season, which corresponds to our winter. The width of the annual rings or rate of growth will vary with soil, climate, altitude, &c. In Malabar, where the climate is moist and equable, 2 $\frac{1}{2}$ rings go to make up an inch of radius; in Koloon the growth is sometimes so slow that 9 $\frac{1}{2}$ rings make up an inch; in a good climate and suitable soil, four rings to an inch would be reasonable, which gives a 6ft. tree at 46 years, and one 8ft. at 61 years. It takes ten years for a teak tree to establish itself, as seedlings apparently burn back before they send up a shoot that at last grows into a tree. Teak logs are always heart-shaken, and in conversion for building purposes the heart must be cut out where the shake extends from the centre each way in nearly a straight line. The waste is not great if the shake does not twist as it goes through the trunk; but it is disappointing to find the same shake horizontal at one end of a log and vertical at the other end, for then the waste in conversion must be great. All teak wood above 20in. diameter is heart-shaken from end to end, so that the builder buys to the best advantage when he secures wood already converted into

flitches or planks. Malabar teak, grown on the western side of the Ghat mountains, though brittle, seems the best for building; that from Rangoon is lighter, and more open in the grain. It is asserted by some authorities that girdling teak makes it brittle, and deprives it of its oil; hence the process has been discontinued in some places. But, in any case, full-grown timber must be killed at least two years before it is cut down. Teak wood varies as much in texture as oak does when grown in England, America, and Germany; it also varies much in weight, being from 39lb. to 53lb. to the cube foot when seasoned; when green it weighs about 57lb. 9oz. In our issue of the 4th inst., on page 301 of the present volume of the BUILDING NEWS, the ends of Rangoon teak logs are sketched showing the heart shake described above. The logs illustrated are 26in. square. The heart of the tree is usually much out of the centre of the log, so that here the sketches of the rings are only diagrammatic. The average rate of growth in Burmah is 3ft. girth in 68 years, $\frac{1}{2}$ ft. in 97 years, 6ft. in 133 years, and 7ft. in 159 years; but the actual rate of growth varies very much according to circumstances, for a 7ft. tree will sometimes represent the growth of only 100 years, whilst another of the same size will be 200 years old. In general forests teak trees do not make more than 1 in 500 of the other trees; in fact, in what are known as teak forests the proportion is only 1 to 300. The leaf of the teak is 16in. across, and something like a cabbage leaf, but very thin, with strong fibre. A tree reaches maturity at about 160 years. First class sawn teak logs are worth, wholesale, here from £11 to £15 per load, and sawn flitches may be included within the same range of prices. The latter, with the teak planks 4in. and 10in. by 19in. and 21in., running up to the highest figure. Six shillings a cube foot is a fair wholesale price for teak in scantlings, not allowing for profit or waste. Eight shillings a cube foot should pay for the best teak in sashes and frames, material only. Shipments of teak are made from Rangoon, Moulmein, and Samarang (East Indies). Teak shingle roofing is common in Burmah. The shingles are cut to 15in. by 5in., $\frac{1}{2}$ in. thick at one end, tapering to nothing at the other end. They are cut with a circular saw, and fastened to lin. by 2in. battens with French wire nails. They are laid to weather 5in. AFRICAN TEAK (*Oldellia Africana*), also called African Oak, comes here from Sierra Leone. AMERICAN WALNUT (*Juglans nigra*), Black Walnut, is found growing from New England to Texas, and from Michigan to Florida. The wood is heavy, hard, strong, coarse-grained, and liable to split if not carefully dried. It is easily worked, and takes a good polish; the heart is a rich dark brown colour with lighter sapwood; a cube foot dry weighs 39lb. The figure of walnut is not usually ornamental; a tangent-cut face shows more "grain" than one cut radially; the wood is in great demand for cabinetmaking. American walnut sells in the log at from 16d. to 18d. per cube foot, average prices; 28ft. cube is a common content for logs. Planks from 6ft. to 15ft. long, and $\frac{1}{4}$ in. to 2in. thick, are worth 3s. 9d. per cube foot, and boards 1in. thick 2d. to 2 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 2 $\frac{1}{2}$ d.; $\frac{5}{8}$ in., 1d. Lagos walnut sells for 3 $\frac{1}{2}$ d. per foot in the inch, and Italian walnut in planks for 60s. per ton. Other varieties of walnut are *Juglans cinerea*, commonly called "Butternut"; *J. rupestris*, Mexican; and *J. Californica*, California. The American black walnut is a tree growing to 100ft. or 150ft. high, with a diameter of 6ft. to 9ft. English walnut was formerly much used for cabinetmaking and gunstocks; the sapwood and roots were also used. Hence the trees were seldom cut down, but almost always "grubbed" up. In 1745, 3s. per cube foot was paid for the English green walnut; many trees at sixty years old, an age at which they reached perfection, being sold to cabinet-makers for as much as £60. These old cabinet-makers polished their work with oil extracted from the nuts, three quarts of which they obtained from a bushel of nuts. It is thought that walnut really means Welsh nut, and that there are several varieties in this country. Nuts for seed were brought over from Virginia, the trees from this seed were "black" walnuts, and they yielded good timber; next came trees grown from seeds obtained at Grenoble; the wood from these was also much prized by cabinet-makers 150 years ago. An old writer says of walnut: "Some wood, especially such as has come from Boologne and New England, is very black of

colour, and so admirably streaked as to represent natural Flowers, Landscips, and other Fancies. To render this the better coloured, the joiners put the boards into an oven after a batch of bread is forth, or lay them in a warm stable, and when they work it, polish it over with oil very hot; which makes it look black and sleek." The writer goes on to say: "It is not good for beams or joists because of its brittleness, though it has been observed to give timely notice of the cracking before it breaks." WHITE WOOD, *Liriodendron tulipifera*, called also yellow poplar from the heart-wood, and white poplar from the sapwood; but it is not a poplar, so that these names are wrongly applied. This is a large tree, which grows from 80 to 180ft. high, and from 3ft. 6in. to 10ft. in diam.; but it is common in the Ohio basin, United States; it is also found from New England to Missouri, and southward to Florida. The wood is light, soft, stiff, and fairly strong, of fine texture and yellowish colour, it shrinks considerably in seasoning, but does not split much; works easily and stands well—an ideal wood for the carver. The best section for "figure" is tangential, but a radial face gives best finished surface for ornamental work, as the medullary rays show up crossing the vertical grain in horizontal bars of silvery wood, there being as many as 25 and 30 to the inch. The wood of the cucumber tree (*Magnolia acuminata*) looks so like whitewood that it is often taken for it in the trade. Whitewood is frequently put on the market here clear of "saps" and planed. Planks are sold for 3s. per cube foot, boards 1in. thick, 1d. per superficial foot. 2in., 1½d.; 3in., 2d.; 4in., 1½d. Whitewood is used for doors, paneling, and wainscoting. The next and final article in this series will be one on the measurement of timber.

INTERNATIONAL FIRE EXHIBITION, EARL'S COURT.

THE General Exhibition Awards at the above exhibition have been made. Among the names likely to interest our readers we note the following:—

COMMERCIAL EXHIBITS.

British Uralite Co., Ltd., Group 1, Class 1, Silver Medal.
Columbian Fireproofing Co., Ltd., Group 1, Class 1, Gold Medal.
Columbian Fireproofing Co., Special for Fire-resisting Roofs, Gold Medal.
Drew-Bear, Perks and Co., Ltd., Group 12, Gold Medal.
J. H. Heathman and Co., Group 12, Silver Medal.
Homan and Rodgers, Group 1, Class 1, Silver Medal.
J. A. King and Co., Group 1, Class 1, Silver Medal.
The New Expanded Metal Co., Ltd., Special for Metal Lathing, Gold Medal.
Ratner Safe Co., Group 1, Class 2, Gold Medal.
St. Pancras Ironworks Co., Ltd., Group 1, Class 2, Gold Medal.
John Smith and Co., Group 2, Class 2, Bronze Medal.
Stuart's Granolithic Stone Co., Group 1, Class 1, Silver Medal.

FIRE-RESISTING ROOFS.

Columbian Fireproofing Co., Ltd., Gold Medal.

METAL LATHING.

The New Expanded Metal Co., Ltd., Gold Medal.

FIRE PREVENTION: CLASS 1.—BUILDING CONSTRUCTION.

British Uralite Co., Ltd., Silver Medal.
Columbian Fireproofing Co., Ltd., Gold Medal.
Homan and Rodgers, Silver Medal.
J. A. King and Co., Silver Medal.
Stuart's Granolithic Stone Co., Silver Medal.
Jabez Thompson, Bronze Medal.

CLASS II.—BUILDING EQUIPMENT.

Ratner Safe Co., Gold Medal.
St. Pancras Ironworks Co., Gold Medal.

A WIDE STEEL-FRAME CORNICE.

THE sixteen-story Bank of the Metropolis is a steel cage office building, which occupies a prominent corner on Union-square, New York. The street fronts are conspicuous, and their upper portions are finished with a very heavily-moulded copper cornice, which projects about 6ft. beyond the centres of the wall columns. This cornice is suspended from beams, channels, and angles parallel to the wall, and supported beyond its face by cantilever brackets riveted to the columns, as indicated in the diagram of the corner of the roof framing. On the Sixteenth-street front the brackets are double, each portion consisting of a pair of inclined channels, shop-riveted together, back to back, and having their lower ends field-riveted across the flanges of the wall columns, and to its projecting tie-plates. Rigid arms are thus provided, which are connected at the outer ends by a 15in. channel, forming a fascia girder to support the extremities of inter-

mediate transverse members parallel to the cantilever brackets. These are single 8in. channels, spaced about 5ft. apart and riveted at the inner ends to the webs of a line of I-beams, parallel to and just beyond the wall columns. These I-beams have their flanges inclined parallel to the roof surface, and are web-connected to the cantilever brackets. The upper edges of the beams and brackets are inclined parallel with the surface of the roof, which slopes inward so as to form a gutter on the centre line of the columns to prevent drip and the formation of icicles, and to diminish the danger from snow falling from the roof to the street. The cross beams carry longitudinal T-bars spaced 19in. apart to receive the flat roof tiles, and the parapet wall is built over the centre of

the fascia girder. At the corner of the building single cantilever brackets are riveted to each of the two inner faces of the column, and the square portion of the cornice between them is carried in the centre by a diagonal bracket, similar to the regular ones but longer, which is attached to the outer flange of the column.

The cornice on the other street front is similar to the one described, except that it is narrower, and the cantilever brackets are made with single instead of double channels. By this construction the cornice is made strong and rigid, and is entirely independent of the roof framing, which is supported at the edges on lines of 15in. I-beams riveted to the faces of the columns below the bracket connections.

Mr. Bruce Price was the architect of the building, and the details of the steelwork were designed by Messrs. Purdy and Henderson, consulting engineers. The structural steel was fabricated by the Carnegie Steel Company, and was erected by the construction department of the United States Realty and Construction Company, which was the general contractor.—*The Engineering Record*.

The unveiling of the memorial statue of Lord Russell of Kilowen took place at Newry on Wednesday week.

The Budleigh Salterton U.D.C. have retained Messrs. Beesley, Son, and Nichols to prepare a scheme for the improvement of the water supply of the district.

At a number of Burnley places of worship structural alterations and improvements have been in progress for some time. The parish church scheme will take about six months to complete, and will entail a cost of about £4,000. It consists of the erection of a new clergy vestry, the removal of one of the three galleries, the installation of the electric light, the erection of a memorial to the late rector, and other works. At Ebenezer Baptist Chapel, a scheme for the building of a new organ and the redecoration of the premises has just been completed at an expenditure of about £1,300. The chapel was reopened last week.

PROFESSIONAL AND TRADE SOCIETIES.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.—The opening lecture of the senior architecture class in this college was delivered on Monday evening by Professor Gourlay, the subject being "The Christian Churches of Athens." The lecturer began by referring to the way in which the Parthenon and other temples were altered to serve as Christian churches. He divided the churches erected by the Christians in the Byzantine style into three distinct types—(1) Those possessing a large central dome, as may be seen in the Church of St. Nicodemus; (2) those having a small dome at the "crossing" of the four arms of the Greek cross, as in the Old Cathedral or Metropolis; and (3) those with the basilican or western type of plan, as in St. Mary's of the Great Monastery. The names of the various parts of a Greek church, with the uses to which they were put, were explained. Finally the methods of building used in the churches of Athens, with the architectural results obtained, were studied. The lecture was illustrated by means of photos, collected, and by sketches drawn by the lecturer while on a recent visit to Athens.

HOUSE PAINTERS' AND DECORATORS' ASSOCIATION.—The tenth annual convention of the National Association of Master House Painters and Decorators of England and Wales was opened at Nottingham on Tuesday. It was attended by a large number of delegates and others, including the Mayor of Nottingham (Councillor A. W. Black), Lord Henry Bentinck, M.P., and the presidents of the Irish and Scottish associations. In connection with the gathering an exhibition of decorative art as applied to manufactures was also held. The mayor, in the name of the city, welcomed the association to Nottingham, and Lord H. Bentinck, in appropriate terms, formally declared the exhibition open. The president of the association (Mr. John Riley, of Nottingham), in his inaugural address, congratulated the association upon its increasing prosperity. He denied that they were united to combat labour, for they were actuated by much higher motives. They wished so to educate their lads that they might cope successfully with any form of decorative treatment required. The necessary instruction was not provided in the ordinary technical schools, but they had taken matters in hand themselves and established technical classes in nearly every town where there was a local association. They had almost completed a scheme for the establishment of a national training school in which their lads could be educated instead of having to study on the Continent. The reading of papers followed. At the conference on Wednesday it was decided to persevere with a scheme for the establishment of a school of painting, the suggested headquarters being Manchester. It was reported that liberal financial support had been promised to the project, which was not designed in any spirit of opposition to the South Kensington or other classes. The president-elect of the association is Councillor J. Higson, of Manchester, and next year's convention will accordingly be held in that city.

The nave walls and sanctuary roof of the parish church of Allington, Kent, are being decorated in colour. The artist is Mr. Godfrey Gray.

The interior of St. Simon and St. Jude's Church, Anfield, Liverpool, has been improved by the installation of electric light, and by painting and decoration. The former work has been carried out by Messrs. T. Jones and Co., of North John-street, Liverpool, and the latter by Messrs. Jelley and Co., decorators, of Slater-street, Liverpool.

Messrs. Chancellor and Son, contractors, of Bath, have completed a new iron bridge over the Yeo at Congresbury. An old stone bridge replaced by the new structure was only 19ft. wide; the new means of communication has a width of 28ft., or 9ft. more. Its rise is also 2ft. less, and a footpath 4ft. wide is provided for pedestrians.

The city council of Lichfield have decided to re-sewer the central portions of the city in accordance with plans prepared by Mr. Elliott, C.E., at an estimated cost of £7,000.

The new graving dock, which will constitute an all-important addition to the shipbuilding resources of Belfast, is now about to be constructed at the harbour. At the last meeting of the Harbour Board, the tender of Messrs. Middleton, Scott, and Co., of London, for the construction of the dock was accepted. The amount of the tender is £206,000. The work is to be completed in three years, but if it is finished in three months less than the three years the contractors will receive a bonus of £600.

Building Intelligence.

ABERDEEN.—The church erected for the parish of Greyfriars, in place of the pre-Reformation edifice which has been removed to make room for the extension of Marischal College buildings, has been formally opened by the Rev. Dr. Gillespie, Moderator of the Church of Scotland. The new church forms the southern boundary of the general plan for the extension of Marischal College, and in its architectural features follows the striking design of these buildings, its tall and massive tower forming the main feature. Internally, the edifice is divided into nave, aisle, and chancel, and has a gallery in the west end under the tower. The fourteenth-century window, which was transferred from the former church, has been built into the east wall. It has been filled with stained-glass work. The figures represent Old and New Testament characters, and illustrate the general and local history of the church, and several compartments in the tracery are filled with symbols of the Passion. In the south aisle there is a row of six stained-glass windows. Between £2,000 and £3,000 has been spent by those connected with the congregation in beautifying the church. The building is seated for 800 persons, and is lighted by electricity throughout. Including the site, the church has cost the Town Council about £25,000. Mr. A. Marshall Mackenzie, A.R.S.A., Union-street, Aberdeen, is the architect.

BASINGSTOKE.—The Bishop of Portsmouth on Tuesday opened the new Roman Catholic Church of the Holy Ghost, in Basingstoke, which has been designed, built, and adorned entirely at his own cost by the Very Rev. A. J. C. Scoles, rector of the Roman Catholic Mission at Basingstoke, in celebration of his silver jubilee as a priest. The site of the church adjoins the ruins of the famous Chapel of the Holy Ghost, which was demolished by Cromwell's army in the days of the Commonwealth at the time of the siege of Basing House. The new church is in the Early English style, and the interior is magnificently decorated. The altar is of onyx, the pillars of marble, and the tabernacle of pure gold.

CLERKENWELL.—The new hall of the Knights of St. John, just erected on the east side of St. John's-lane, Clerkenwell, has been completed. The extension of the premises has been carried out so as to preserve the appearance of continuity with Prior Docwra's gateway—all that remains of the once famous headquarters of the English Langue of the Order of St. John of Jerusalem. The ground floor is used as a showroom for ambulances and transport waggon; above this are the brigade offices; and on the top floor is the hall, a lofty and well-proportioned apartment, panelled in oak with a massive oak roof, the groining of which corresponds in character with that of the archway of St. John's Gate. The wall-pieces of the roof are supported on stone corbels carved into figures of angels holding shields. There is a rectangular lantern, and in the windows are inserted a number of coats of arms, copied from the escutcheons of knights carved upon one of the towers of the Castle of Badrum, in Asia Minor, which was built by the Knights Hospitallers in the 15th century, and surrendered to the Turks in 1522. The opening of the lantern is divided into two squares by a massive crossbeam, and on each side of these squares are four shields—in all thirty-two—on which it is intended to blazon the coats of famous knights. On the east side of the hall, on a dais, are three chairs of state in carved oak. At the south end is a stone fireplace, with mantel, on which are three shields of arms. Two mounted suites of armour flank the fireplace, and on the walls are a number of paintings of notable members of the Order in the 16th-century. The chamber on the ground floor of the east tower contains the library, and also serves as a reception-room. In this room may be seen the only known fragment of the original priory—a few square feet of herring-bone masonry—for the conventual buildings erected in the 12th century were burned during Wat Tyler's insurrection in 1381.

CROSRAGUEL ABBEY.—Following upon the principal works, which were several years ago carried out for the preservation of the ruins of Crosraguel Abbey, situated midway between Maybole and Kirkcaldy, a number of further minor works, with the same object in view, and which have been going on for some time, have now been completed. These additional works, as also the

principal portion, have been carried out by Messrs. Milligan, builders, Ayr, under the direction of Mr. J. A. Morris, architect, F.S.A. Scot., Ayr. The abbots' tower at the south-east corner of the abbey, through which runs the small rivulet giving the water power for the driving of the abbey mill, is in a very dilapidated condition, particularly the western wall. Recent excavations at the west end of the nave outside have revealed a fine Gothic arch, filled in with masonry, in which there is a rectangular niche. This arch was a doorway, but why it had been filled up cannot be conjectured.

DRESDEN, STAITS.—The reopening of the Church of the Resurrection, Dresden, near Longton, North Staffordshire, after enlargement of the chancel and renovation of the church, with dedication by the Bishop of Lichfield of the addition to the chancel, the memorial windows, and other gifts, took place on Tuesday week. Designs for the present church were made just half a century since by Mr. (afterwards Sir) Gilbert Scott, and the church as it first existed, with provision for future enlargement, was erected by Mr. Evans, builder, of Ellastone. Dresden Church was consecrated by Bishop Lonsdale in 1853, and at once came into use as a chapel-of-ease to Blurton. Ten years after the south aisle was added at a cost of £450. In 1872 the whole fabric westward was lengthened two bays, and 200 additional sittings were thus provided, at a cost of £1,079. In 1879 an organ-chamber was added, and ten years later a new organ was placed therein. In 1881 further improvements were made. Now, after a lapse of 22 years, the jubilee of the consecration has been chosen for carrying out a renovation of the whole interior, a lengthening of the chancel by 10ft. eastward, and an improvement in the lighting of the nave. The alterations in the fabric have been designed by Mr. J. H. Beckett, architect, and carried out by Messrs. Tompkinson and Bettelley, while the painting and decorating have been done by Mr. P. H. Bennion. The memorial windows, all of which are in the chancel, are from the studio of Messrs. Heaton, Butler, and Bayne, London. A new west window has been inserted.

LITTLE ILFORD.—New Congregational church and schools are to be erected at Little Ilford. The buildings are designed in a Late period of Gothic freely treated, and are faced externally with red brick, the dressings and tracery, &c., being of white Costessey work. Minister's and deacons' vestries are provided in connection with church, with other conveniences. The choir and organ are situated in apse behind pulpit. The seating is circular on plan, radiating from the pulpit as a centre, so that every member of the congregation directly faces the preacher. The accommodation of the church is for 724 adults. The school accommodation comprises a main hall on first floor, size 32ft. 6in. by 45ft., together with ladies' retiring room and men's retiring room in connection with same. Also kitchen, cloakroom, and other conveniences are given on this floor. On the ground floor is placed the minor hall, size 35ft. by 32ft. 6in., together with three classrooms, cloakrooms, and other conveniences. Electric light is to be adopted throughout. The contract for the two buildings complete is £4,435. Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, W.C., are the architects; and Messrs. F. Gough and Co., Church-road, Hendon, N.W., are the builders.

MIDHURST.—The contract work of erecting the King's Sanatorium at Midhurst was commenced last week. The pumping operations for water supply have all been completed by Messrs. John Aird and Son, and they are now carrying out about a mile and a half of road for access to the site from the main road. Messrs. Langley, of Crawley (the firm who have completed Christ's Hospital, Horsham), have obtained the contract for the foundations of the main building. Last week on p. 394, by a slip of the pen, we referred to Mr. A. W. West instead of to Mr. H. Percy Adams, F.R.I.B.A., of Woburn-place, as the architect. Mr. A. W. West was the architect who collaborated with Dr. Latham in producing the essay (Mr. West making the plans) that obtained the first premium in the essay competition, which was thrown open to all the medical men in the world, when some one hundred and eighty competed. This essay (and the plans) referred to an imaginary sanatorium for an ideal site, and the plans were for the purposes of illustrating Dr. Latham's ideas. At that time the site for the sanatorium had not been selected.

After the essay competition was over the committee carefully went into the question of the selection of an architect to design the new building, and all the architects associated with the successful essays, and also several other architects who did not compete, were interviewed by the committee, who selected Mr. H. Percy Adams. The designs now being carried out at Midhurst bear little resemblance to any of the successful essay plans, but are on the lines suggested by Dr. Latham.

SUNDERLAND.—The Palace Theatre of Varieties at Sunderland was reopened last week, after having been closed for several months for alterations of an extensive character. The stage, together with the proscenium, has been brought forward 10ft. The proscenium arch is supported at each side by two Corinthian pillars, with embellished pedestals, and consoles at the top of each, and the summit of the arch is panelled and enriched with mouldings, the whole being crowned with a Classic cornice, with medallion incidentals. The four boxes on either side are surmounted above the second circle level with balustrades, above which has been erected domes, to be illuminated with numerous red, white, and blue electric lights. The prevailing tints in the whole of the decorations are vermilion and gold. Additional dressing-rooms have been made, and among other improvements are additional lighting facilities on the stage, electric lighting for the whole building, increased accommodation for the orchestra, and the rescating of the building. A great change has been made in the modes of exit from the pit, pit stalls, second circle and gallery. The alterations were designed by Messrs. W. and T. R. Milburn, Sunderland, and the contractor or building was Mr. T. P. Shafto.

WHITTINGHAM, NORWICH.—The completion of extensive improvements, alterations, and additions at the Norfolk County Lunatic Asylum at Whittingham was celebrated on Thursday in last week. The chief feature of the scheme, which has been carried out from plans by and under the direction of Mr. A. J. Wood, has been additional accommodation for male patients. Three new blocks have been added to the annexe of 1880, situated some 500 yards north of the main asylum. The main building is now devoted to female and the new one to male patients. The new works comprise the enlargement of the annexe, and its conversion into a complete asylum for male patients, retaining the original building for females, and the rearrangement of the stables, artisans' workshops, and boiler-house. The contractors for the building were Messrs. W. King and Son, 3, Vauxhall Bridge-road, Westminster, S.W. The total outlay has been about £170,000.

CHIPS.

The old grammar school on Sparrow-hill, Rochdale, having been demolished, the work of building a new nurses' home on its site has been commenced this week. The home will be of red brick with stone facings. It is expected to be ready for opening early in the spring.

A new district church is to be built at Hordle, near Lymington. Mr. Thomas Pike, of Milford-on-Sea, is the contractor.

The board of guardians for Bury, Lancs, have adopted plans for the building of a new workhouse infirmary at an estimated cost of £35,100.

The Mayoress of Newcastle-on-Tyne opened the new Wesleyan mission-hall in Westgate-road in that city last week. The hall, which will afford seating accommodation for 1,400 people, and is over nine shops, is estimated to cost nearly £30,000, the site being worth £8,700.

At Polperro, Cornwall, foundation-stones were laid last week of a Wesleyan chapel. The building will be Modern Gothic in type, will be faced with stone, and seated and furnished in pitch-pine. Accommodation will be provided for 450 persons, and the architects are Messrs. John Wills and Sons, of Derby and Lincoln.

The Commissioners appointed by the Australian Government to inquire into the construction of a Trans-Australian Railway have sent in their final report, in which they recommend the adoption of the Tarcoola route, at an estimated cost of over four and a half million pounds. The proposed railway is intended to develop the unknown interior of Western Australia.

The Bishop of Nottingham, Dr. Brindle, D.S.O., laid on Monday the foundation-stone of a new Roman Catholic church, to be erected in George-street, Barnsley. The site cost about £1,000, and the building itself, which will accommodate about 700 worshippers, will cost from £8,000 to £10,000.

Engineering Notes.

BIRMINGHAM.—Good progress is being made with the construction of the new viaduct to connect Small Heath with Sparkbrook. The first span, from Bolton-road, has been finished, and the second is now being bolted together on a wooden framework, and will probably be dropped into position on the piers, with the aid of "jacks," during next week. This span, which will finally contain about 370 tons of steel, is the largest of the series. It is 144ft. in length, and the main girders alone weigh 90 tons each. Immediately it has been fixed in its permanent place the fitters will be busy with their cranes and pneumatic riveting apparatus on the third span—the one that will cross the main line. For this section the steelwork has already been bolted together tentatively in the maker's yard at Motherwell. All the piers, eleven in number, were erected on their foundations some time ago, and the brickwork at the two extremes of the bridge has been completed, together with that portion which extends across the canal on the Montgomery-street side of the railway. Here the approach to the bridge has been improved by the demolition of some private property, and the widening of the thoroughfare at the junction of Kendal-road and Montgomery-street. The total cost will reach the estimate of £49,000. The bridge will be ready for traffic next spring.

KIRKCALDY HARBOUR EXTENSION.—Sir A. M. Rendel met a joint committee of Kirkcaldy Town Council and Harbour Commission on Thursday night in last week regarding the proposed harbour extension, and produced plans showing the existing harbour and wet dock converted into one large wet dock and outer harbour, six acres in extent, with detached breakwater 500ft. long, for summer steamers and trade in good weather. The total cost he estimated at £100,000. The engineer was authorised to prepare a written report on the scheme, plans to be distributed amongst the members before next meeting, for discussion in time for obtaining Parliamentary powers.

NEWCASTLE-ON-TYNE.—A visit was recently paid by the Newcastle-on-Tyne Association of Students in connection with the Institution of Civil Engineers to the new high level bridge which is being erected across the Tyne between Newcastle and Gateshead for the North Eastern Railway Company by the Cleveland Bridge and Engineering Co. The bridge is situated between the existing High Level Bridge and Redheugh Bridge, and is to consist of four spans of steel girders supported on piers of granite ashlar with approaches on either side formed of stone arches. It will carry the main railway traffic between north and south. The work is being carried out under the direction of Mr. Chas. A. Harrison, chief engineer to the North Eastern Railway Co. The sinking of the caisson on the Gateshead side is now being carried out. Mr. Harrison explained the plan to the students, mentioning that in the Forth Goods Yard, between the Carlisle line and the other side of the Forth warehouse, the underground work to make the ground carry the additional weight required 5,000,000 bricks to build. From Pottery-lane to the land abutment, the bridge arching is practically completed, and there are ten arches in all. A temporary stage is being prepared round the north caisson for the first pier. The centre pier temporary stage is complete, and the caisson, 113ft. by 35ft., will be sunk 69ft. below high water. The south caisson is sunk 59ft. below high water, and it is filled up with 7,500 tons of concrete; the weight of the caisson itself is about 500 tons. The sinking done is about 10in. per day. Owing to the strata on the Gateshead side, the original plan had to be abandoned, and instead of four arches the foundations are now being made of a pier, which is practically an abutment. Old coal workings, dating from very early times, were come upon here, and the filling in required 700,000 bricks. The contractors are going to erect pillars on either side of the bridge, 120ft. high, to take a cable way across for building the centre pier. This will be 9½in. in circumference, and will carry a load of ten tons. The cable is the output of Messrs. T. W. Smith, Newcastle. The caissons of the new bridge will cover an area of 3,600 square feet.

ROKER, SUNDERLAND.—The conclusion of an important undertaking of the River Wear Commissioners was signalled on Wednesday, when,

to record the completion of the Roker Pier, a large polished block of black granite was placed in position in the lighthouse at the extremity of the pier by the Earl of Durham, Lord-Lieutenant of County Durham. This great scheme, which is being carried out at a cost of over half a million sterling, was inaugurated eighteen years ago. It embraces the construction of two piers of granite and concrete on the north and south sides of the river, which, when completed, will render safe the entrance of vessels in any kind of weather, and also form a harbour of refuge. The immense granite and concrete blocks, weighing up to fifty-six tons, used in the building of the piers have been constructed at works belonging to the Commissioners, where they have been placed upon waggons by a Goliath crane, and then lifted into position at the Roker Pier by means of a sixty-ton hydraulic radial crane. The length of the pier just completed is 2,800ft., and the new pier in course of construction on the south side of the river will be 2,844ft. in length, of which 2,299ft. have been constructed. The width of the Roker Pier is 35ft. for a distance of 2,000ft. out, and for the remainder it is 41ft. The height above high water is 10ft. At the extreme end of the pier a round-head has been constructed on a foundation 40ft. below low water, and rising to a height of 18ft. above the level of high water, the total height of the structure being 72ft. 6in. It rests upon a caisson 101ft. long by 69ft. wide, which, when sunk into position, was filled with 10,000 tons of concrete. The lighthouse erected upon this structure is of red and white granite, and rises to a height of 54ft. 6in., its diameter at the bottom being 31ft., gradually reduced to 16ft. at the summit, and the lantern has a diameter of 10ft. Its focal plane is 33ft. 6in. above high water. The cost of the entire scheme is expected to be about £549,000, of which the new pier just completed will cost £290,000, including the round-head and lighthouse. The works have been carried out from plans by and under the supervision of Mr. H. Hay Wake, M.Inst.C.E., who since 1878 has been the engineer to the Wear Commissioners.

There has just been erected in St. Giles' Cathedral, Edinburgh, a memorial to the late Mr. Lindsay Mackersy, W.S., clerk of the church and parish. The memorial, which has been placed in the vestibule of the north door, is in the form of a bronze tablet, which in its brief inscription conveys a sense of the very great services Mr. Mackersy rendered to St. Giles' during his lifetime. The tablet was designed by Messrs. Hamilton and Inches, of Edinburgh.

At Cleator Moor, in West Cumberland, on Friday, the unveiling took place of a public memorial to commemorate the golden wedding of Mr. and Mrs. John Stirling, of Fairburn, Muir of Ord, Ross-shire, and the proprietor of the well-known Iron Ore Mines, Cleator Moor. The memorial takes the form of a monument erected in the Market Square. It is of Balmoral granite, alternated with dark grey Rubislaw granite, and consists of a fountain, surmounted by a stork, with a bill erect forming the water-jet. The whole is elevated upon a three-stepped granite basement, 10ft. 6in. square. The urban district council are enclosing the monument with an iron fence and granite kerb.

The town-hall at Wolverhampton, built in 1871 at a cost of £20,000, is being enlarged, at a cost of about £15,800, from plans by Mr. F. T. Beck, architect, of Wolverhampton.

Two memorial windows have just been placed in Holy Trinity Church, Malvern. One is emblematic of Purity and Charity, and the other has as a subject Christ blessing little children.

Subject to Parliamentary powers being obtained next session, a light railway is about to be constructed from the railway terminus at West Kirby across the Dee to Rhyl, Colwyn Bay, and Llandudno to the North Wales coast, reducing the distance from Liverpool in point of time by more than one-half. The project will involve the construction of a span bridge over the Dee between five and six miles in length, and it is intended to carry it straight across from the Cheshire side over the Tansky Rocks or Little Eye, joining Flintshire between Mostyn and the Point of Air, probably at the South Sluice. The railway will then proceed along the side of the road through Rhyl and Colwyn to Llandudno. The engineering side of the undertaking has been allocated to Mr. C. H. Davison, of London, and the surveyors are Messrs. Boulton, Son, and Maples, of Liverpool.

At St. John's Church, Woolwich, a memorial organ, built by Messrs. W. Hill and Son, was dedicated on Thursday in last week.

STAINED GLASS.

PETERBOROUGH CATHEDRAL.—The soldiers' memorial window now inserted in Peterborough Cathedral West Front will be unveiled by Lord Roberts on Tuesday next. The subjects are Peada, the founder of the early church at Peterborough, St. Peter, St. Paul, and St. Andrew, to whom the church was dedicated, and St. Ethelwold, of local renown. These form the upper tier. In the lower five are St. George, St. Michael, St. Alban, Joshua, and Gideon, warriors, who are typical of the Memorial character of the window. In the stone arcade below are brass tablets inscribed with the names of the local fallen in the South African War. The design is by Mr. G. F. Bodley, R.A.

The Bishop of Oxford opened, last week, new schools for the parish of St. Mary and St. John, Oxford. The cost of the block with the site was rather more than £6,000.

The Aston District Council had a special meeting recently to consider the report of the Tramways Committee with regard to the electrification of the tramways in the district. The committee had considered two alternative schemes, and recommended that a double line of tramway be constructed along Aston-road from the city boundary, Aston-road North, and Lichfield-road, with a single line under the railway bridge at Aston station, and a double line of tramway in Victoria-road from the Vine Inn to the Six Ways, the work to be executed by Mr. George Trentham, of Birmingham, at an estimated cost of £32,500. The report was adopted.

In continuation of their plan to form a new street from the pier to the railway-station, the corporation of Douglas, Isle of Man, have resolved to purchase additional property along the line of route. The engineers for the new reservoir at West Baldwin reported, at the last meeting of the town council of Douglas, that 136,000 cubic yards of earthwork had been placed in the embankment, leaving 36,000 cubic yards still to be done. One hundred and ninety men are employed. The outlay has been £51,676. The value of the work done, based on the original price in the engineer's estimate, is £35,593.

The buildings connected with the Industrial Exhibition at the east end of Glasgow were inaugurated last week. The ceremony took place in the main hall of the permanent buildings, which are situated off Whitehill-street, in Dennistoun. The guarantee fund amounts to nearly £15,000. The spaces for exhibits have been largely taken up, and most of the leading industries, not only of Glasgow, but of Scotland and part of England, will be represented.

The Committee of the Museum of Fine Arts at Boston, Mass., have erected on the site of its new building on the Fens an experimental structure, consisting mainly of a large movable skylight some 50ft. above the ground, which is to be used for determining the best position and the best lighting for the skylight of the future picture-gallery.

The Board of Trade has approved of the plans for the construction of tramways, on the conduit system of electric traction, from Camberwell Green to near the junction of Lordship Lane and Crystal Palace-road, as well as of a line at Denmark Hill, connecting the above with the tramway through Coldharbour-lane, promoted by the London County Council.

At a meeting of the Newcastle-on-Tyne City Council on Friday, it was agreed to adopt the recommendations of the Trade and Commerce Committee relative to the improvement and extension of the Newcastle Quay, at an expenditure of £559,000. The plans and report were prepared by Mr. Elge, the city engineer.

The chairman of the Hendon Urban District Council dedicated on Wednesday the public park for Hendon, which has been purchased by the local authority at a cost of about £7,500. Comprising 30 acres, the ground is situated in the centre of the parish.

The ancient church of Lady St. Mary, Wareham, Dorset, was reopened on Friday, after restoration carried out under the supervision of Messrs. Crickmay and Sons, architects, of Westminster and Weymouth. The whitewashed ceiling has been removed, and a new open roof provided. Perpendicular in character, with moulded principals, purlins, and wind braces, the whole in pitch-pine, covered with slates. The removal of the ceiling has brought to light a small east window, which will be filled with stained glass from the studio of Messrs. Percy Bacon Brothers.

Mr. Alfred Leader, of Kingsthorpe, Church-road, Forest-hill, who died on August 7 last, aged 49 years, of the firm of Messrs. John Williams and Co., of Dinorwic Slate Wharf, Rotherhithe, marble, slate, and cement merchants, left estate valued at £36,264 19s. gross, and the net personality at £35,432 14s. 6d. The testator, besides family bequests, gave to two clerks in the employ of his firm £500 each, to two other clerks £200 each, to an office boy £25, and £15 each to two carmen.

A PROPOSED TOWN CHURCH IN THE MIDLANDS.—COUNTY OF LANARK DISTRICT OFFICES.—PORTER'S HALL, SHENLEY, HERTS.—"FAWSIDE," CURRIEMUIR END, COLINTON.—LANCASHIRE AND YORKSHIRE BANK, BOLTON.—NEW POST-OFFICE, BOLTON.—NEW POST-OFFICE, MIDDLETON.—NATIONAL EISTEDDOD OF WALES.—DESIGN FOR A SEMI-DETACHED VILLA.—OLD GERMAN CHAIR AND TABLE.

Our Illustrations.

PROPOSED TOWN CHURCH FOR THE MIDLANDS. This scheme includes much of the existing fabric, although the work really comprises the practical reconstruction of the entire church. When finished, the building will present an entirely different character to the present one, and will make an eminently well adapted arrangement for modern church services. The interior is broadly treated with good fields of wall and roof space for decoration, the crossing being surmounted by a dome. The high altar is brought forward in the apse, as it should be for appropriate effect, a massive stone-built screen supporting a range of statues being located between the sanctuary and the organ, which is placed eastward of the screen on either side of the apse. The choir stalls, however, occupy the usual position—north and south of the presbytery. Mr. Walter Aston, F.R.I.B.A., of Manchester and Macclesfield, is the architect. The interior shown by our double-page plate is by Mr. John Langham.

COUNTY OF LANARK MIDDLE WARD DISTRICT OFFICES, HAMILTON.

This building has lately been erected to meet the wants of the Middle Ward of the County. The site adjoins the Old County Buildings and Court-houses, with which the new offices are designed to correspond; but in the new work the details are treated more freely. The stone in the building is a cream-coloured sandstone from Auchenheath Quarry, and the staircase is of a greyish-white sandstone from Overwood Quarry, both in Lanarkshire. The architect is Mr. Alex. Cullen, of Brandon Chambers, Hamilton. We shall at an early date give the committee-room of the same building.

OUT-BUILDINGS, PORTERS PARK, SHENLEY, HERTS.

The exterior of the Cowhouse is faced with cement, roughcast. The walls in the courtyard are built in white Flettons with red brick dressings. The roof is of Tiberthwaite slates. The turret, which is of oak, is surmounted by a copper dome with a wrought iron vane and copper finial. The builders were Messrs. Simpson and Son, of 48, Paddington-street, W. The Electric Light Engine House is built in Luton grey bricks with red brick dressings, and roofed with green slates. Accommodation is provided on the first floor for a resident engineer. The builders were Messrs. Simpson and Son, of 48, Paddington-street, W. The Cottages, built for farm labourers, are constructed of red brick and half-timber work, and roofed with hand-made tiles. The builders were Messrs. Boff Bros., of Park-street, St. Albans. The Stud Farm is built in white Flettons with red brick dressings and roofed with old tiles. The builders were Messrs. Miskin and Sons, of St.

Albans. The above were erected from the designs of Mr. C. J. Harold Cooper, and the originals of our reproductions were exhibited in this year's Royal Academy.

"FAWSIDE," CURRIEMUIR END, COLINTON.

This house, which has recently been erected for Mr. J. G. Scott, is built of Lancashire pressed bricks, with Raabon tile roof; half-timber is painted black, but barge-boards, windows, &c., are ivory white. The house is so arranged that the kitchen and servants' rooms overlook only the kitchen garden. Mr. Edward C. H. Maidman, of Edinburgh, is the architect.

NEW PREMISES, DARWEN STREET, BLACKBURN.

This building is being carried out for the Lancashire and Yorkshire Bank, Limited, from the designs of Messrs. Stones and Stones, architects, Richmond-terrace, Blackburn, and North John-street, Liverpool, by Messrs. E. Lewis and Sons, builders, Grimshaw Park, Blackburn. The chief elevations—viz., to Darwen-street and Market Street-lane—are faced with local stone, and all the dressings are also from the local quarry, known as Butler Delph. This stone is a bright yellow in colour, and stands the trying weather conditions peculiar to this part of the country very well indeed. The floors are all fire-resisting, and all the walls of good substantial thickness. The main roofs are to be covered with grey-green slates from Kirkby Ireleth Quarries. The tower roof will be covered with copper.

NEW PREMISES FOR THE MIDDLETON CORPORATION FOR POST OFFICE AND TENEMENT OFFICES.

This building is being carried out from the designs of Messrs. Stones and Stones, architects, Richmond-terrace, Blackburn, and North John-street, Liverpool. It is intended to provide on the ground floor the post-office for Middleton, and on the upper floors will be offices for letting. Part of these will probably be occupied by the Corporation officials. The tender of Messrs. W. A. Peters and Sons, of Rochdale, has been accepted for carrying out the work.

PRIZE DESIGN FOR A VILLA.

This design was awarded the first prize at the National Eisteddod of Wales, held at Llanelli last month. The only conditions issued were that special reference was to be given to sanitation and ventilation, and the cost was not to exceed £750. PERCY THOMAS.

CHIPS.

The new public baths at Bramley, Leeds, are approaching completion. They comprise a large swimming-bath, first and second-class slipper-baths for both sexes, and a Russian bath. The swimming and first-class slipper-baths are provided with shower-baths. The architect is Mr. J. Lane Fox, Leeds and Dewsbury.

Queen's-street Wesleyan Church, Scarborough, after having been closed for five months, and undergone extensive improvements, at an outlay of £3,000, has been reopened.

The authorities at Windsor Castle are engaged in the reconstruction of drainage works prior to His Majesty's arrival for his November visit.

Mr. A. D. Price, M.Inst.C.E., inspector of the Local Government Board for Ireland, has held an inquiry at Bray, Co. Wicklow, respecting an application of the urban district council for sanction to a loan of 18,500 for the purpose of enabling them to carry out schemes under the Housing of the Working Classes Acts. It was stated that in one of the districts of Bray 60 labourers' dwellings had been taken down as being unfit for human habitation. With regard to Little Bray, 81 families had only one room each. In Purcell's Field 200 persons occupied 36 houses. As regards sanitary arrangements, 126 labourers' dwellings in Bray had no sanitary accommodation whatever.

New schools are about to be built in Lomax-street, Rochdale, in connection with St. Patrick's Roman Catholic Church. The schools will accommodate 640 children in three departments, and will cost about £6,000.

The bridge constructed by the Pennsylvania Railroad Co. between Trenton and Morrisville across the Delaware River has just been opened for eastbound traffic. The length of the new structure is 1,080ft., and its width 55ft. The bridge is wide enough for four parallel tracks. The actual cost was £200,000 sterling; but about half a million sterling additional was spent on approaches and in removing several grade crossings.

COMPETITIONS.

BIDEFORD.—At Monday's meeting of the Town Council of Bideford correspondence was read which had taken place between the town clerk and Mr. Dunn, of Birmingham, whose competitive plans for free library and municipal offices were recently accepted, in reference to the big increase in the price of the tenders over the estimated cost. The town clerk, writing Mr. Dunn, said the council were surprised to find that some of the tenders exceeded nine thousand pounds, the local tenders—Messrs. Ellis, £6,300, and Messrs. Glover, £6,215 11s.—being the lowest. They desired to draw his attention to the fact that his estimate was a total of £6,130. Deducting from this the clerk of the works' salary, architect's commission, cost of loan and premiums, &c., it would be seen that after allowing £500 for extras, the lowest tender was about £600 above his figures. Even then the sum included in his (Mr. Dunn's) £2,000 for library fixtures was not taken into account. The council were desirous of discussing the matter with him, but in the meantime they wished to know whether it was in any way possible to cut down the figures without materially impoverishing the buildings. In conclusion, the town clerk added that the financial question was a very important one, and the council would not care to embark on any scheme involving an outlay of more than £6,000 to include all outgoings. Mr. Dunn, in reply, said the difference in the several tenders might be explained by the fact that in many ways it would cost builders from a distance more to do the work than it would firms nearer home. Although originally he did not expect his estimate of £6,130 to be exceeded, there had since arisen several matters quite unforeseen in connection with the buildings, site, &c., which would to some extent account for the additional cost. It might be possible to omit a few items without impoverishing the buildings, but they were not many. After some discussion the question was referred back to the committee.

HERNE HILL, S.E.—At the last meeting of the Lambeth Borough Council, a report was received from the Libraries Committee recommending the issue of advertisements inviting designs for the new Herne Hill library buildings, the applicants to be limited to architects residing in Lambeth. Originally the proposal was to give the work to Mr. Sidney R. J. Smith, F.R.I.B.A., but the council referred the matter back, so that many designs could be seen and a selection made. The recommendation was adopted.

MADRID.—Competitive designs are invited for a casino, to be built in Alcada-street, one of the main thoroughfares of Madrid. A premium of 20,000 pesetas (about £330 sterling) is offered for the plan placed first. "Should the author of the project be a Spaniard," the official report states, "he will be charged with the direction of the works, with the fees and under the conditions that are fixed hereafter. If a foreigner, besides the 20,000 pesetas offered for the property of the project, he will receive 7,500 pesetas, half of the fees assigned for the direction of the works, the society being at liberty to appoint any Spanish architect to take charge of them." The managing committee invite designs to be sent in by Dec. 15, and each project must include a specification, plans, tender, and estimate.

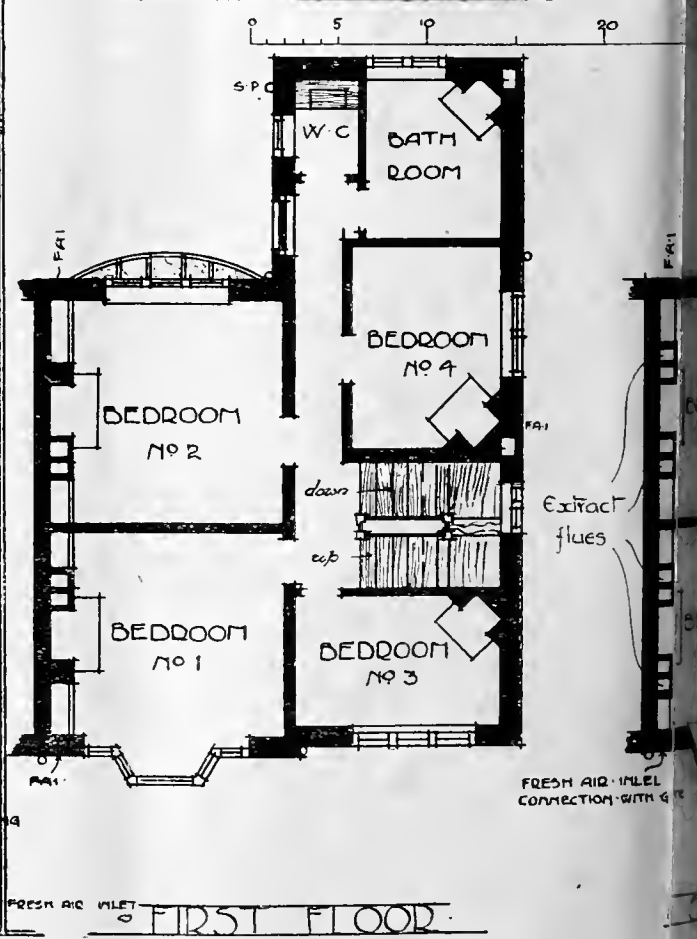

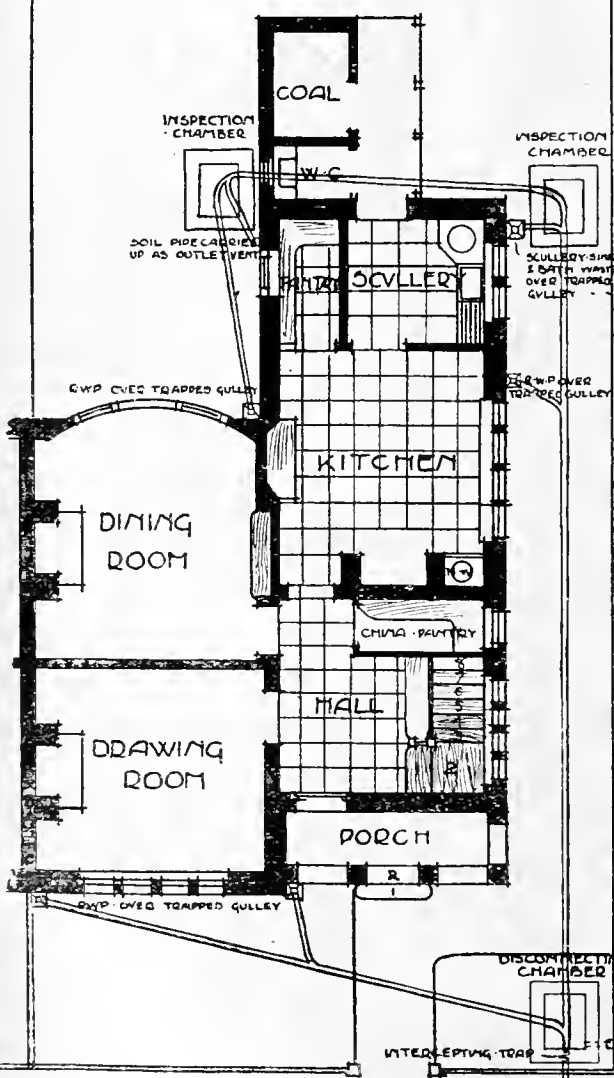

The promenade from Seacombe to New Brighton, which has recently been completed, is over two miles in length, and the three ferries are linked together without a break. The construction of the Seacombe extension occupied about two and a half years. The Parliamentary estimate of the cost was £45,000, and the expenditure comes well within that figure.

The memorial to be erected at Chatham to the officers and men of the Royal Engineers who fell in the South African War will take the form of an arch, similar to the Crimean Memorial Arch which stands at the entrance to the Royal Engineer Barracks. A site for the memorial has been chosen in front of the Royal Engineer Institute at Brompton. A monument to include four large bronze effigies of Boers, brought home from South Africa by Lord Kitchener, was originally proposed; but in deference to a wish expressed by many members of the corps, this idea has now been abandoned. The four effigies were a part of an intended memorial to Mr. Kruger at Pretoria.

The town council of Devonport have passed, *nem. con.*, a resolution stating that where a contractor fails to observe the standard rate of wages and hours of labour he shall be fined £5 for every £100 in the value of a contract up to £1,000.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., L., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—W. H. and Co.—M. R. S.—K. L.—I. G. T.—G. O. R.—M. A. P.—L. I. T.—H. W. and Son.

Correspondence.

SWANSEA COMPETITION FOR HOUSING THE WORKING CLASSES.

To the Editor of the BUILDING NEWS.

SIR,—In June last designs were sent in for this competition. Have any of your readers heard anything of a result or decision? Is this "affair" to add another story to the mighty monument of bogus competitions?—I am, &c.,
Sept. 22.

AD. REM.

The King has promised to present a new lectern to Portsmouth Parish Church, now undergoing restoration. The lectern will be of gunmetal, and will be the only one made of that material in any church.

The City Corporation has purchased for its permanent collection of pictures at the Guildhall Art Gallery a painting entitled "Mowing Bracken," from the brush of Mr. H. La Thangue, A.R.A. The picture, which has been hung in one of the upper galleries, was exhibited at the last Royal Academy.

Intercommunication.

QUESTIONS.

[12007].—**Electrical.**—Can any of your readers inform me which is the best book on electric wiring and lighting generally (elementary)?—A. G. S.

[12008].—**Normandy.**—What are the best places to visit upon the adjacent mainland during a short sojourn in Jersey? I believe facilities offered for crossing from the latter island *via* Gorey are excellent.—AN ARCHITECTURAL TAIPPER.

REPLIES.

[12003].—**Private Street Works: Apportionments.**—There can be no doubt that A should pay for 82ft. run, the width to be half that of the bottle neck. The return measurements should not be charged.—H. LOVEGROVE.

[12004].—**Reservoir.**—You can see in most libraries Longman's "Notes on Building Construction." Part 4 has what you want, chap. xiv., Retaining-walls for Water. There are many pages worth perusing, rules and illustrations.—REGENT'S PARK.

[12004].—**Reservoir.**—I would suggest to "G. W. C." that he should cover his reservoir and construct it entirely with cement concrete. If he likes to pay me a visit, I shall be pleased to show him three tanks that I have constructed in this material that answer extremely well. The whole of the tanks I refer to are above ground, and are constructed with cement concrete walls 6in. thick and floor 3in. thick. I think "G. W. C." would find this mode of construction not only very satisfactory, but cheaper than any other material he can employ. If "G. W. C." likes to communicate with me, I shall be pleased to give him full details. I send herewith a sample of the material I have used for you to forward to your correspondent.—HENRY KETTLERY, Barton Court, Abingdon.

[If the querist sends on three stamps and his address we will send him the sample.—ED. "B.N."]

[12005].—**Pastel.**—A Pastel is a crayon made of a paste composed of a colour ground with gum water. A crayon is made of compressed chalk or coloured earths.—REGENT'S PARK.

[12005].—**Pastel.**—There is really very little difference between the two. The word crayon means chalk. Black crayons are of Italian black chalk, a white crayon of French chalk, and some of red chalk are made in France. The word pastel means a little roll or cake, and is made of fine pipeclay, gum-water, and the required pigment.—H. L.

[12006].—**Distance of Adjoining Buildings.**—If you get small work on "Light and Air," by B. Fletcher, of B. T. Batsford, High Holborn, you will see many points given. Lateral obstruction dealt with, p. 107, which seems to fit in with your case. The angle of incidence of light is dealt with, p. 89. Angle of 45° from point of sill of window to line of eaves of adjoining owner was generally taken as a fair guide; but it is not always adopted by the Courts, as you will find. Book well illustrated.—REGENT'S PARK.

[12008].—**Distance of Adjoining Buildings.**—In the County of London buildings can be placed quite close together so long as they do not touch; but it is very foolish, as the space between the walls is a receptacle for damp and wet. In the provinces some of the by-laws provide for parapets within a certain distance. In any position, if the buildings must be placed close together, one wall only should be built as a party-wall, with a parapet for the requisite height above the roofs. Every man has the right to build to the full extent of his own land, except in the case of frontage lines.—H. LOVEGROVE.

The German archaeological expedition to the island of Cos, in the Egean Sea, has discovered on the walls of a newly-unearthed building some account of the famous ancient medical school of Cos.

The work in connection with the erection of a new bridge across the River Tay at Kinclaven, Perthshire, near the foot of the famous Beech Hedge on the Marquis of Lunsdown's Meikleour estate, has been in progress for some weeks past. The bridge, which is to take the place of the ferry boat at present in use, will consist of six concrete arches, with stone facings and parapets and concrete coping, and will have a roadway 16ft. wide. The whole work has been contracted for by Messrs. Young, Ltd., railway contractors, Glasgow. The plans are by Mr. Harrison, C.E., and advice in their preparation was given by Sir John Wolfe Barry. The bridge will cost £6,000.

The Chepstow Urban District Council have instructed Mr. Harry W. Taylor, A.M.I.C.E., to thoroughly examine and value the works and undertaking of the Chepstow Water Company, with a view to purchasing them.

Messrs. J. B. Joyce and Co., Whitechurch, Shropshire, have received instructions to make a striking clock with three illuminated dials, for Wootton Hall, near Ashbourne, Derbyshire, the residence of the Hon. Henry Bourke. The same firm have just completed the fixing of a large clock at Pitminster Church, Somerset.

Mr. Cameron Corbett, M.P., having acquired the lands of Thornliebank, formerly the property of the late Mr. Alexander Crum, M.P., has presented 136 acres of picturesque land as a public park for Glasgow. The grounds are situate five miles south of Glasgow Royal Exchange, and cost the donor, together with the mansion which is included in the gift, £24,000.

STATUES, MEMORIALS, &c.

CRATHIE, N.B.—A Queen Victoria memorial was unveiled by the King on Sunday at the comparatively new parish church of Crathie, in which Royalty is accustomed to attend Divine service while the Court is in residence at Balmoral Castle. Quite recently his Majesty substituted for its blue elates a roofing of red tiles, while within the edifice he has erected memorials to his mother as well as to his late brother the Duke of Saxe-Coburg and Gotha, and his late sister the Empress Frederick of Germany. In addition, he has finished off the pulpit with a canopy of carved wood. The memorial to Queen Victoria takes the form of a portrait bust, set in a niche on the face of the massive granite pillar that marks the angle of the choir and the south transept, in which is the Royal pew, the very pillar, by the way, at the lower part of which the late Queen laid the foundation-stone of the church with her own hands in 1893. The bust itself is of white Carrara marble, whilst the niche and its supporting bracket and surmounting canopy, which, like the church itself, are Scottish Decorated in treatment, are hewn out of Aberdeenshire granites of various hues, the greys of Dossie and the corals of Donside being intermixed. The leading feature in the composition is the richly-carved canopy, pierced with tracery and finished with a battlemented cornice. The bust, which is the work of Mr. Emil Fuchs, of London, represents her late Majesty wearing a crown with veil falling gracefully on to the shoulders over the robes and the Order of the Thistle. The memorials to the Duke of Saxe-Coburg and Gotha and the Empress Frederick consist of medallion portraits let into the wall on each side of the south or Royal transept, adjoining the tiny stained-glass window inserted in the church by Queen Victoria to perpetuate the memory of Prince Henry of Battenberg and the late Duke of Clarence. The medallions of white statuary marble are so disposed as to fill in the upper part of an oblong tablet of dark grey marble framed in Caen stone. The new oaken pulpit canopy, which can be raised or lowered by a wrought-iron and brass chain, harmonises with the architecture of the church, and bears around its sides the emblems of the New Testament writers in proper colours.

CHIPS.

The 20th general annual report by the Board of Trade under section 131 of the Bankruptcy Act, 1883, just issued as a Parliamentary paper, shows a decrease in the number of failures as compared with the previous year of 106. In the building trades the failures showed a total for the year of £621,154, a decrease of £121,041 on the previous year's return.

Glasgow University Court have decided to proceed with the present extension operations, involving an expenditure of £100,000, without altering the sites or designs, as requested by an influential opposition.

Liskeard Corporation has purchased the Trehawke estate for the sum of £2,570.

The foundation stone of the new municipal offices which are being erected for the corporation of Crewe was laid on Wednesday by the Mayor of Crewe. The total cost of the buildings, with furniture, will be about £18,000. Mr. Henry T. Hare, P.A.A., F.R.I.B.A., whose design, selected in competition, was illustrated in the BUILDING NEWS for May 8 of this year by elevation, plan, and perspective, is the architect.

At the meeting of the Croydon Corporation on Monday, Mr. George Fearnley Carter, who has for four years acted as assistant engineer to the corporation, and who has had previous experience at Leeds, was elected chief borough engineer. The commencing salary is £800 per annum, rising to £1,000 in two years.

The first tenants of the new market hall for Leeds opened their shops on Saturday morning, though not for six or seven months will the building be completed. The hall is being erected from plans by Messrs. Leeming and Leeming at a cost of about £100,000. We have illustrated the hall in our issues of April 26, June 21, and Sept. 13, 1901.

Lord Windsor, the First Commissioner of his Majesty's Works and Public Buildings, has appointed Mr. Louis Parkes, M.D., to succeed the late Professor W. H. Corfield as consulting sanitary adviser to the department.

The Bishop of Winchester will consecrate, on Wednesday in next week, the 30th inst., the church of All Saints, near Windlesham, which has been built by Mrs. Christie in memory of her late husband, Mr. R. C. Christie, of Manchester.

Mr. Hodgson, the Director of Railway Construction, Public Works Department, Government of India, has issued a circular to all engineers employed on large works, with time and opportunity at their disposal, asking them to experiment with a process just discovered in America for increasing the tenacity of clay by mixing it with the liquid obtained from boiled straw.

LEGAL INTELLIGENCE.

BRADFORD CITY CORPORATION STREET IMPROVEMENTS.—At the town-hall, Bradford, on Friday, September 18, Lieut.-Colonel W. W. Wellsted, Mem. Inst. C.E., of Hull, sat as sole umpire to determine the price to be paid to Messrs. Hameyer and others in respect of their interest as owners of certain property in Church Bank, Bradford, for the purpose of widening Church Bank. The claimants' counsel was Mr. Ernest Pollock, instructed by Mr. Elliott Smith, of Mansfield, and Mr. W. Waugh represented the corporation, instructed by the town clerk. The claimants' witnesses were Messrs. F. Hameyer, D. Fell, E. Vallance, F.S.I., Mansfield, S. Jackson, and Thos. Fenwick, Leeds, who placed the value at £1,929. The corporation witnesses were Messrs. W. B. Woodhead, Robt. Hudson, R. Armistead Bradford, who valued the land taken and the injury to the premises left at £457. The umpire reserved his decision.

IN RE LIGHTBOUND, RIGBY, AND CO., LIVERPOOL.—A meeting of the creditors of Charles Latham and Ralph Norbury, trading together as Lightbound, Rigby, and Co., at 170, Regent-road, Liverpool, and at other addresses, timber merchants, and also as the Saginaw Lumber Company, of 8, Victoria-street, Liverpool, was held on Wednesday at the Exchange Station Hotel, in that city. Mr. Harvey was voted to the chair, and Mr. Denton, chartered accountant, presented a statement of affairs. It showed the total liabilities to be £142,333 10s. 5d., of which £78,761 were unsecured, and of this amount £67,897 was on account of Lightbound, Rigby, and Co., and £10,864 9s. 2d. on account of the separate business of the Saginaw Lumber Company. The creditors fully secured were £55,156, and the amount of securities held by them was estimated at £93,034. Partly secured creditors figured for £5,936, and the assets held by them stood at £4,966, leaving a deficiency of £1,000. The total net assets were returned at £80,143, showing a surplus over the net liabilities of £1,382. Mr. Denton stated that the firm's difficulties appeared to have been brought about by their purchase and development of a large building estate at Oakhill, Old Swan, Liverpool, into which from time to time all the available resources of the firm had been diverted. At present, however, only about one-third of the estate had been realised, and in the opinion of competent valuers it was fully worth the value put upon it in the statement. The realisation of the estate would depend mainly on the manner in which this property was dealt with. A committee was appointed to consider the whole matter and report to the meeting, which was adjourned for that purpose to that day week.

IN RE F. E. BEST, ASHFORD, KENT.—Under the failure of Frank Edward Best, of Ashford, East Kent, builder, carrying on business under the name or style of "E. Dryland and Co.," the statement of accounts shows gross liabilities amounting to £1,773 13s. 6d., and unsecured liabilities £505. The net assets are estimated to realise £1,210 13s. 2d., thus showing a surplus of £705 13s. 2d. The causes of failure are stated to be losses incurred owing to delay in obtaining money on contracts.

A new Gospel hall in Station-road, Clevedon, Somerset, was opened on Friday. It is faced with Cattybrook bricks and Pensat stone, and is seated for 250 persons. Mr. Joseph E. Taylor is the architect and Mr. W. A. Green the builder.

The death is announced of Mr. John Fecitt, of Blackburn, who had lately returned from an American trip. He was the head of a firm of builders and contractors, and was a member of the Blackburn Town Council.

Birmingham crematorium is now to all intents and purposes complete, and is ready to be put into operation. The opening ceremony will probably take place on either October 6 or 7, when it is expected that Sir Henry Thompson will be present.

Mr. Alfred S. Blackman, M.I.C.E., who has for four years been electrical engineer to the Metropolitan borough of Poplar, has been appointed by the electricity committee of the Bradford Corporation to the position of electrical engineer, formerly held by Mr. Chattock, at a salary of £600 a year. Mr. Blackman is 33 years of age.

The urban district council of Honiton have appointed Mr. Hayter, late assistant surveyor of Bitterne, Southampton, to the post of borough surveyor.

St. Chad's Church, Bensham, Gateshead, will be opened on Tuesday in next week. Mr. Beall is the contractor for masonry, the woodcarving has been executed by Mr. Ralph Hedley, of Newcastle, while the internal east wall of the chancel is being decorated in fresco secco by Mr. J. Edie Reid, the subject being the Annunciation.

The town council of Musselburgh have adopted plans by Mr. George Landale, their borough engineer, for a fever hospital, estimated to cost £5,950, being at the rate of £375 per bed.

WATER SUPPLY AND SANITARY MATTERS.

BIRMINGHAM CORPORATION WELSH WATERWORKS.—The council of the Institution of Mechanical Engineers visited the new reservoirs at Rhayader, on Wednesday week, on the invitation of Mr. James Mansergh, F.R.S., engineer to these new waterworks of the Birmingham Corporation. The corporation have acquired 45,000 acres (71 square miles) of moorland embracing the watersheds of the Elan and the Claserwen rivers above Rhayader, Mid Wales, and are taking the water thence 80 miles to Birmingham. It is expected that water will be supplied from the new source in July of next year. The scheme when carried out will have cost £5,000,000. It includes the construction of solid masonry dams which back up the water of the two streams into a series of lakes, with the head of one lake reaching to the foot of the next higher dam. The lakes are used for the supply of Birmingham and for compensation to the riparian owners on the river Elan. A submerged dam retains a supply of water in the lowest lake for the special use of Birmingham. The total storage capacity of the lake is about 13,000 million gallons, and when full they will supply both the compensation water and the Birmingham requirements over a six months' drought. The cast-iron pipes leading to Birmingham are calculated to suffice for the supply of 1,000,000 persons, but the tunnels and aqueducts are sufficient to convey water for 3,000,000 persons when the whole watershed will be utilised.

WALLASEY SUPPLIED WITH LAKE VYRWY WATER.—By arrangement with the Liverpool Corporation a supply of water from Lake Vyrwy, Montgomeryshire, has been brought to an existing reservoir at Gorse Hill, New Brighton, and thence is carried by mains through Wallasey and Seacombe, where a population of 56,000 hitherto furnished with water from local wells in the red sandstone is being provided for. The great Vyrwy Aqueduct, constructed ten years since for the Liverpool Corporation, has been tapped at Hatchmere, and from that point a water main, 21in. in diameter, has been laid to the Wallasey district. This branch water line traverses a distance of 34 miles, the route passing from Hatchmere through the Delamere Forest, the townships of Manley, Picton, Stoke, Whithy, Hooton, Hinderton, Woodchurch, and Leasowe, into Wallasey. At many points of the route the main is carried under or over brooks, canals, bridges, and railways. Most trouble was occasioned by the passage of the Gowry River at Mickle Trafford, the main being finally carried underneath the stream by a siphon pipe. Another difficult part of the work was the crossing of the Chester and Birkenhead Railway lines at Hooton. The crown of the road bridge at this busy junction being insufficient to carry the large main, the latter has been split into a series of smaller pipes for the actual crossing, these being reunited again on the other side of the railway into a 21in. main, whereby the water transport is continued to the Wallasey boundary in Leasowe-road. At this point a meter-house has been erected, and therein a suitable meter will mechanically reckon the toll which Wallasey must pay to Liverpool for the Welsh water. From the Leasowe meter-house the main is continued for the present to the existing reservoir at Gorse Hill. This reservoir is capable of holding only 2,000,000 gallons, but alongside is now in course of construction a reservoir to accommodate nearly 4½ million gallons more, and here eventually the Vyrwy water will be stored. Under the agreement with the Liverpool Corporation Wallasey borrowed a sum of £146,000 to provide the 34 miles of main from Hatchmere to Wallasey, and the Wallasey Urban District Council borrowed £17,500 to carry on the main a further three miles through their own district to their own reservoirs. That £146,000 has to be repaid by Wallasey in thirty years at the rate of 6½ per cent. per annum. The line has, however, actually been constructed at a substantially less figure than the £146,000 originally estimated as the cost. Wallasey has agreed to take of the Vyrwy water a minimum supply of 500,000 gal. a day, and to pay 6d. for every 1,000 gal. Every year, therefore, Wallasey must also pay to Liverpool for water supplied £4,562 10s. In addition to these two items, Wallasey has to repay an additional annual sum of £2,259 on account of loans of £27,000 for the Gorse Hill new reservoir and tower, and £21,000 for the home line of the Vyrwy main and other pipe line extensions. Wallasey may supply other districts with the Vyrwy water on obtaining the consent of Liverpool, which is not to be unreasonably withheld. Already under this clause Wallasey has arranged to supply the Hoylake Water Company if and when necessary. The whole work of laying the 21in. water main from Hatchmere to Wallasey, and the further three miles to carry on the supply to the reservoir and high-level water-tower at Gorse Hill, New Brighton, has been executed by Messrs. Holme and King, the contractors, within eighteen months. The Wallasey portion of the works has been carried out under the direct supervision of Mr. J. H. Crowther, water engineer to the council, who also took a practical part in the task of surveying and selecting the route for the Vyrwy branch main.

Our Office Table.

The London County Council has decided not to promote a Bill in Parliament next session for the purpose of securing the amendment of the Building Acts. The somewhat crude Bill brought forward last year was so fiercely assailed by interested parties that, as it will be remembered, it was withdrawn. The time for giving notice of such a measure has passed by, and, in view of recent expressions of opinion at County Hall, no request will be made to suspend the Standing Orders. The Bill is, however, only set on one side for a while, and in all probability a year hence the committee concerned will submit their draft suggestions.

MR. ARNOLD-FORSTER, M.P., will open the Autumn Exhibition at the Whitechapel Art Gallery on Tuesday week, Oct. 6, at 3.30 p.m. The exhibition will illustrate "Shipping" on its various sides, historical, mechanical, and artistic. The King is lending models and pictures, and the Prince of Wales more than twenty models, amongst which are some of his famous silver "nefs." The Victoria and Albert Museum, the United Service Institution, and the corporations of Ipswich and Liverpool are among the contributors, as well as many of the large shipping companies. Special attention will be paid to the historical development of shipbuilding, and many interesting models and prints of the 17th, 18th, and 19th centuries have been promised. The Director would welcome any offers of loans of models and pictures which would enable the committee to carry out their project effectively. The exhibition will entail heavy expenses, and donations are asked for from those interested in a subject of such vital national importance as the shipping industry.

It is proposed to found a society analogous to those already existing in Paris and Berlin, with the object of presenting pictures and other works of art to the national collections. A provisional body has been formed to promote this object in the United Kingdom. A meeting will be held during the autumn, when definite proposals will be made, and supporters of the movement will be invited to nominate a council and an executive committee. The scheme has received sympathetic encouragement from the heads of the national collections. Broadly speaking, the proposal is to enrol as many members as possible by whom an annual subscription of one guinea will be paid. It is anticipated, however, that members may be willing to contribute donations in proportion to their interest and means. Such donations may be allocated to any of three separate funds:—(1) For ancient pictures and drawings, (2) for other ancient works of art, (3) for modern works of art. The executive will appoint purchasing committees, in whom a certain discretion will be vested. From time to time it may be found necessary to issue appeals, inviting contributions towards the acquisition of objects of unusual importance. It is hoped that the fund may become a further channel through which gifts, bequests, and memorial presentations may be made to the national collections. The difficulties and delays caused through large committees having to sanction the purchase of any single work of art have led those who are responsible for this scheme to provide that the purchasing committees shall appoint honorary buyers, to whom the maximum of discretion will be delegated. Mr. E. W. Beckett, M.P., is the treasurer *pro tem.*, and Messrs. Isidore Spielmann, F.S.A., and R. C. Witt are the hon. secretaries, *pro tem.* The offices are at 47, Victoria-street, S.W.

A useful series of articles is commenced this week in the *Weekly Times* and *Echo* on "London Charities," giving much information never before published of various charities in connection with the various London parishes, notably Bethnal Green, Battersea, Bermondsey, Camberwell, Greenwich, Hackney, Hampstead, Lambeth, Lewisham, Limehouse, Paddington, Holborn, Aldgate, Shoreditch, St. Luke's, Westminster, Deptford, Southwark, St. Pancras, Covent Garden, Whitechapel, Wandsworth, and others. It is surprising how little known is the existence of these funds by those for whose relief they were intended, and from whom, we fear, in too many cases their benefit is diverted.

SOME months ago the Monmouthshire County Council appointed a provisional committee to inquire into the working of the Education Act as

it would affect the Council. The committee appointed Messrs. Roberts and Swash, architects, of Newport, Mon., to report upon the condition of the voluntary school buildings throughout the county. Their report was submitted to a meeting of the provisional committee held on Friday. It characterises the general structural condition of these schools as unsatisfactory. The probable cost of putting the buildings into proper repair, as required by the Education Department, is considerable, and ranges in different cases from £10 to £500.

At the Associated Portland Cement meeting on Wednesday, Mr. F. A. White said that if the "wisdom and statesmanship" of the Government decided that duties on certain foreign imports were desirable, then cement was an article with a prior claim to protection. Economy, he said, had been accompanied by large expenditure on extensions and improvements of plant, amounting last year to £117,879, and this expenditure will have to continue for some time. So with the object of replenishing the diminished working capital the directors have arranged to create £120,000 of "capital expenditure certificates," bearing interest at 6 per cent., and to be paid off in 12 months instalments. They are now placing £100,000 of these certificates, and the balance will be issued as and when required. With reference to the current year Mr. White anticipated that the new Rotary plant at Swancombe would have a very important and advantageous bearing upon profits.

The School of Art Wood-Carving, South Kensington, which now occupies rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition-road, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the Technical Education Board of the London County Council are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week, and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

The Board of Agriculture have just published a "Memoir of the Geology of the Country around Torquay," price 2s. In this memoir is a full description of the Devonian strata and fossils, with notes on the volcanic rocks, and diagrams illustrating the complicated structure of the area. The New Red Sandstone Series, including the Watcombe Clay, and overlying conglomerates and breccias; the cavern deposits, raised heathes, and submerged forests, are likewise described, and there is a brief account of the economic products. The memoir is intended to accompany the lin. map-sheet 350 (new series) which was published in 1898, hand-coloured, price 3s.

On the property of Mr. Wingfield Digby, M.P., at Fifehead Neville, Dorset, have been found some remains of a Roman villa. In 1880 some indication of the site was discovered in an elaborately-designed mosaic floor, and through the action of Mr. Digby, who has borne the cost of the excavations, the remains have now been brought to light. They include several large tessellated floors, the tesserae being exceptionally small and of artistic design. The stone foundations of the walls of the villa have also been disclosed, together with the hypocaust and flues by which the winter living room was warmed. The excavations have been carried out under the superintendence of the Rev. G. Engleheart, of Salisbury. On Wednesday the site was visited by 100 members of the Dorset Field Club, with Lord Eustace Cecil, the president.

An exhibition of building improvements and decorative art was opened at the Brighton Aquarium on Wednesday by the Mayor. It has been promoted by the Aquarium Committee, with the co-operation of an advisory committee of local architects, presided over by Mr. C. E. Clayton. The principal object in view is to show the whole process of building in a series of illustrative exhibits, a specially attractive feature being the number of working exhibits. These include the printing and staining of artistic wall-papers, and the process employed in the making of art pottery, and the staining of glass; another corner of the exhibition being devoted to practical demonstrations of hammered ironwork. The architects of Brighton have filled one long gallery with a collection of architectural drawings, and the opera-

ting theatre has been given over to the Municipal Technical Schools and the School of Art, whose students not only exhibit specimens of their work, but are also seen practically engaged in terracotta modelling and in executing fancy brick archwork and other branches of technical instruction. The exhibits and practical working demonstrations occupy the whole available space at the Aquarium. Medals are to be awarded, and the task of allotting them has been delegated to a jury of local architects.

EASTON AND COMPANY, LTD., of Erith and Westminster, appear to be in difficulties. Mr. W. B. Peat, of 3, Lothbury, E.C., was appointed on the 16th inst. receiver and manager, and is carrying on the business under the direction of the Court. He is responsible for all orders given by him subsequent to the 16th inst., and creditors' claims previous to that date are to be sent to him.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Devon and Exeter Architectural Society. Excursion to Dartmouth. Visit to new Naval College under guidance of Aston Webb, R.A., F.R.I.B.A. Trains from Exeter at 8.40 a.m. and 10.50 a.m., from Millbay, Plymouth, at 10.30 a.m. 10.40 a.m.

FRIDAY.—Architectural Association. Annual meeting. Address by the President, Henry T. Hare, F.R.I.B.A.; Presentation of Prizes. 9, Conduit-street, W. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

OCTOBER 2nd. ANNUAL GENERAL MEETING at No. 9, Conduit-street, W., at 7.30 p.m. Address by the President, Mr. HENRY T. HARE, F.R.I.B.A., and distribution of prizes, medals, and certificates.

Exhibition of Students' work, price and other drawings. COURSES OF INSTRUCTION IN ARCHITECTURE. The Day School will open on MONDAY, September 28th, at 9.45 a.m. Intending pupils are requested to forward their names to the Secretary as early as possible.

The Evening School also opens on the same date at 6.30 p.m. A pamphlet containing full information as to the Classes and advantages of membership may be obtained upon application to the Secretary, at 95, Great Marlborough-street, London, W. LOUIS AMBLER, Hon. Secs. H. TANNER, Jun., Hon. Secs.

The General Hospital, Cheltenham, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The new central school for defective children in Cloughton-road, Birkenhead, was formally opened on Friday. The building, which will accommodate 130 scholars, contains an assembly-hall, eight classrooms, doctor's room, and lavatories on the ground floor, with a dining-room and recreation-room on the upper floor, and teachers' dining-room. Mr. Chas. Wise, of Birkenhead, is the architect.

The memorial to Dean Farrar will take the form of stained glass to fill the great seven-light Perpendicular west window of the chapter-house of Canterbury Cathedral.

At the last meeting of the City Court of Common Council, the streets committee brought up a report on the question of the framing of new by-laws in connection with the pulling down of buildings in the City: together with suggestions by the Royal Institute of British Architects, the Surveyors' Institution, and the Institute of Builders. Sundry amendments were moved by Mr. Deputy Douglass Mathews, F.R.I.B.A., but by agreement the discussion of the report was adjourned until the next Court.

A Local Government Board inquiry was held at the Municipal Buildings, Liverpool, on Wednesday, with reference to the application of the city council for sanction to borrow £26,000 for the erection of public baths on land situate in Picton-road and Glynn-street, Wavertree.

The memorial window and tablets that have been placed in Bodmin Parish Church were unveiled by the Earl of Mount Edgcumbe (the Lord-Lieutenant of the county) on Monday. The stained glass is of 15th century character, and represents four warrior saints, while in the predella beneath is a battle scene. The tablets are of yellow Verona marble, inclosed in a framework of alabaster.

The memorial-stone of the new St. Alphonsus Church and Schools in connection with St. Wilfrid's, Hulme, will be laid by the Roman Catholic Bishop of Salford to-morrow (Saturday). The memorial-stone of the new presbytery will be laid at the same time. The cost of the church, house, and schools will be £6,000, and the total cost of the extensions at St. Wilfrid's, with the new buildings, will be £7,200.

The foundation-stone of the new chancel of the parish church at Ulverston was laid on Friday afternoon by Lady Evelyn Cavendish. The total cost of the alterations being made to the church will reach £2,000.

Trade News.

WAGES MOVEMENTS.

STOCKTON-ON-TEES.—The strike of plumbers at Stockton is assuming more serious aspects. The whole of the men employed in the town are out, and the building trade is becoming affected. The employers are trying to fill the strikers' places from outside. The men came out three weeks ago as a protest against an alleged violation of the working rules by one of the firms employing non-unionists.

THE WELSH SLATE TRADE.—The *Slate Trade Gazette* says that a communication from St. John's states that the Newfoundlanders are looking forward to the transfer to their colony of certain Welsh quarry firms. It is reported that one quarryman has under consideration plans for the removal of an entire town near his Welsh quarry to Newfoundland, where he can give 3,000 men employment. The communication adds that Welsh slate has been known as the best in the world, but experts who are prospecting and working Newfoundland beds on Trinity Bay and Bay of Islands say Newfoundland slate is superior to Welsh, besides being easier to quarry and almost inexhaustible.

CHIPS.

The Dolgelley Urban District Council have purchased the works and undertaking of the Dolgelley Water Company upon such satisfactory terms that, after buying the works and spending a considerable sum in improving and bringing them up to date, there will be sufficient profit from the commencement to reduce the rates by 4d. in the £. Mr. Harry W. Taylor, A.M.I.C.E., has acted for the council throughout.

The foundation-stone of the new Municipal Hall at Deptford will be laid by the Mayor of that borough on Wednesday, October 14.

M. Coquelin, the well-known actor, is said to have discovered a method of preventing fires in theatres. Details of his invention will not be made known until the patents for which he has applied are granted.

On Wednesday week the foundation-stones of the new mission church of St. Mark's, Duke-street, Leek, were laid. The cost of the new church will be about £1,000, and it will seat 250 worshippers.

Provost Halliday has intimated to Lochmaben Town Council that Mrs. Halliday and he are prepared to bear the expense of a sewerage system for the burgh. The offer will entail on the donors an expenditure of at least £1,500.

The Hall-i'-th'-Wood, near Bolton, which was built in the 15th century, and was for a time the residence of Samuel Crompton, the inventor of the spinning mule, has been turned into a museum, and up to the present £1,500 has been spent on the building by the corporation, to whom it was presented by Mr. W. H. Lever. The corporation are now about to borrow a further sum of £1,150 for the purposes of the museum, and a Local Government Board inquiry into the matter was held on Wednesday week.

The committee on tramways of Leith Town Council have resolved to recommend the council, when the tramways are acquired, to introduce electric haulage over the entire system.

The Church of St. John the Baptist, Hulme, Manchester, was recently reopened after being repainted and decorated. The colouring of the walls is a warm yellow (as to the upper portion), which brightens up the interior and brings into clear view the timber-work of the lofty roof. The lower portion is a warm reddish-brown, surmounted by a stencilled band (about 9in. high) of an intertwining vine-leaf pattern. In the chancel the ground colour of the walls is a warm yellow. The wall surface north and south is broken by arches, and between and above these arches it is ornamented with a vine-leaf and fruit design. In the intervening spaces are depicted soaring birds symbolising praise. The work has been carried out by Messrs. John Cantrill and Sons, under the direction of Mr. Gerald Cogswell, A.R.I.B.A.

The trustees for the improvement of the city of Bombay, at a special meeting, have appointed Mr. J. F. Watson, a candidate from England, as assistant engineer on Rs.400 per mensem. At present the board have under construction buildings of their own value of 12 lakhs of rupees, and their lessees are constructing others of the total value of 30 lakhs.

The members of the Devon and Exeter Architectural Society will have an excursion to Dartmouth to-morrow (Saturday). The President, Mr. A. S. Parker, A.R.I.B.A., will entertain the members at luncheon at the Castle Hotel, Dartmouth, at 1.15 p.m. Mr. Aston Webb, R.A., F.R.I.B.A., will attend and kindly show the party over the new Naval College buildings now in course of erection.

FRIDAY, OCTOBER 2, 1903.

STANDARD PLANS.

PROBABLY there is a type to be found for every class of building, if only the architect knew where to look for it. As a matter of fact, he is often at a loss to know where to find a structure that will give him an idea that will suit his purpose; for, after all, it is the idea that the designer wants in the planning and design of any building. A man may be a thorough artist, a skilful designer; but if he be without an idea to work upon, a great deal of his ability may be thrown away. A good stock of ideas, of mental plans and arrangements or treatments of design is of the utmost value to the architect; but how very few in the profession appear to possess this gift! The average practitioner, absorbed with all sorts of business details and duties, has very little opportunity. When he has a building to design that is a little out of the common, he naturally turns to his volumes of the BUILDING NEWS or other professional journal, to his portfolios, or to works that have been executed by other members of the profession, and if he is at all skilful in adaptation he may be able to do something with them; but he may just miss the right motive or principle of design. If he could at once hit on the right motive or idea of plan, an immense amount of laborious thought and effort, pencilling and erasing would be saved. All that he can do in ordinary circumstances is to take up the problem where others have left it, trusting to his own invention and skill to produce a building that will serve its object. It is this difficulty which is felt by all who enter the profession of architecture. The majority of men are without the gift of invention: they can take up the subject just where their immediate predecessors have left it, without trying to make any effort to discover a better scheme or principle. A new public library is contemplated, or there is a competition for one. The average practitioner is contented to find out a library recently built, and to base his plans upon it, without ascertaining primarily what the actual requirements are of a public free library and its mode of working and organisation, and endeavouring to meet these in the most direct manner he can. In this way he would probably be led to a more economical and simple plan than by following the arrangement of a building that may not be perfect even for its particular site. Any faults it had he may perhaps repeat, and in a worse form. But this is the ordinary mode of proceeding. He does not pursue his inquiry into the origin and functions of the building, but takes an example of an executed structure that may be defective. In designing a public school, the architect often overlooks an ideal plan which would considerably simplify his design for the sake of following one that has been built for a different site, and it is the same with the planning of a large hospital for special cases: a typical arrangement may be found out by investigation and study; but, instead, the architect adopts the general scheme of some executed hospital without inquiry. Town halls and municipal offices now exist in numerous cities, and it ought not to be difficult to find out good types of plan to follow. The shape of the site and various other things, like light and levels of ground, have to be considered; but the leading principles of locating the departments, of communication between the offices, lighting, &c., should be clear to the mind before

the design is carried out. A type of plan does not necessarily refer solely to the ensemble or grouping of the building, but to the internal connection of the parts, the principle of disposing the offices of town clerk, of town surveyor, the accountants' and rates department, sanitary and medical offices, the town council chamber and its various subsidiary rooms, and if there is a large assembly hall the position for it that will fulfil the requirements of the L.C.C. or local regulations as to entrances and exits, lighting, &c. Above all, it is necessary to have a correct idea of the requirements of the public, and the easiest and direct routes to such departments as the rate-collector's offices, the sanitary offices, the magistrates' courts, the town hall, &c., so that the routes or corridors may not overlap other departments or cause confusion and inconvenience to the regular officials engaged in other offices. This principle of economy of plan is very often neglected in designs for buildings of this class. The most frequented public offices ought to be planned with as short and direct routes from separate entrances as possible. Again, there are some good types for technical schools and laboratories and public baths which ought to form a staple subject in every architect's education; but these are not generally available. The best designs for buildings of this description are by men who are not inclined to publish their work, and are not communicative about the results achieved or the principle they have made their own; so the ordinary architect has to be contented with buildings of less repute. When we consider that experience of a special kind is dearly bought, we are not surprised that the best public buildings are only accessible to those who can visit them and make their own personal observations. The organised visits to buildings in progress or finished, made by the Architectural Association and other societies, enable members of these bodies to learn something of their plan and design, which is of great value to students. The published plans of buildings of particular kinds, such as those we give, are also of great value, if they are studied in a proper manner without exclusive reference to their accidental and external character. They ought to be studied, not copied; and the way to study them is not to be satisfied with looking at the plan and finding out its good points, but to discover how they comply with the requirements—to do which the problem must be thought over first, and the conditions of the site and building mastered. Unless the problem is mentally present, the examination of a building or a plan can have little value except in exhibiting the skill and craftsmanship of the designer in the details of the plan. The mental effort to see what is required and to express it in form is very seldom attained, and it is this which constitutes the idea. The standard building is more or less an expression of such an idea; but there are few of them, and it is only the skilled architect that can discern one when he sees it. The majority are content to follow second-hand, and to take ordinary buildings as their guides. But, as we have said, men with ideas are rare, while there are an abundance of people who take their knowledge second and third-hand, and who design buildings in the same way. They do not care for advances. The plan of a hospital or a set of baths which was tolerable many years ago is sufficient for them; clients and committees also put their trust in them;—they would rather accept a design which shows a disposition of wards or baths they are accustomed to see, than a new plan based on the most recent science. They are not cognisant of the most advanced practice, so the general movement in architecture, as in other things, is along a moderate line—a *via media*. For this reason new ideas find slow acceptance with the public, and the men with advanced views of

arrangement or construction are often not so fortunate as their less accomplished brethren. There are standard plans for most structures: we mean those which have been designed by experts and leading architects. The development of specialism has led to this. Thus there are many leading firms who have designed and erected university, elementary, and technical schools; who have obtained a name for their asylums and hospitals, and for baths and washhouses, and town-halls. It would be invidious to notice the names—they are well known as experts in these several branches of work. These works are accessible, and many of the designs and plans have been published. Even in housing for the labouring classes we can refer to a few men who have done good service, others who are successful house-builders, others who have made a reputation for their designs for churches. We say it would not be difficult to pick out typical plans of buildings in all the above classes—plans which are types of good arrangement and economy, and which have been found to work well. We do not mean that these typical plans should be copied in any sense, but merely be accepted as fairly good models of buildings in different circumstances. Thus, for instance, the Manchester Town Hall might be taken as a typical example of a good plan for the particular site. Those of Liverpool, Leeds, Bradford, Glasgow, and Belfast may be regarded as types of more monumental buildings. The Municipal Offices of Sheffield may be taken as a good example of planning for a triangular or trapezoidal site. And in all the best plans we find these main characteristics: (a) the grouping of departments, (b) facility of access to each from the street, (c) intercommunication between the separate offices, (d) in lighting of rooms and corridors. The premiated designs for the Hull Town Hall extension show also some good planning, which deserves notice. For smaller buildings on rectangular sites, such a design as that selected for Tottenham may be taken as a good model; but there are many other buildings which contain the germs of desirable arrangement.

In hospital design many types are to be found as in those we have illustrated, built by the Metropolitan Asylums Board, as those at Hither Green and Tooting for fever cases. The recent competition plans for a Royal Sanatorium for Tuberculosis and the Frimley Sanatorium, Surrey, in connection with the Brompton Consumption Hospital, for single and double beds, with corridors, arranged as radial pavilions of two stories from a centre building where special cases are under close inspection, are plans based on the latest experience. In such designs every patient's room is made to face South, S.S.E., or S.S.W. The Manchester and Salford Skin Hospital designs afford also good models for study. The new Belgrave Hospital for Children, Kennington, has a good plan of pavilions placed with axes at right angles to each other. Each ward is disconnected from the main building by means of a lobby or bridge. Any doubtful case is isolated. A good type of ward for special cases of treatment is the main feature to notice; and, in the second place, the principle of disposing the separate pavilions on the ground, so as to insure ample sunlight and air. The special rules drawn up by the management of the particular hospital will, of course, be the best guide to the architect. Copying in a case of this sort would be suicidal. We can imagine an architect taking the general scheme of a hospital with radial or other distribution of blocks, and applying it to another site having a different position as regards aspect. The idea would be simply absurd; but he can examine the principle of its design—the way the ward windows face, the direction of the separate pavilions, and the plan of each ward. He must study the design analytically, so as to discover its

principle before he thinks of adapting any portion to another site. There has been a great deal of indiscriminate copying of buildings, in which often the least useful or desirable parts are copied, while the real solution of the problem is left out. In the design of technical schools there are several standard plans which are available. These schools have been and are being erected all over the kingdom, good, bad, and indifferent. It is for the architect to find out the requirements—the size and position of classrooms, lecture-rooms, laboratories, and their fittings—before he is able to compose a plan suitable for any position. With this object the standard plan will afford him a guide. He may take for example the Manchester Municipal School of Technology as a good school constructed on modern principles of arrangement, and there are many technological schools in London as that at Finsbury. The municipal school at Manchester is a fairly good model to study. The plan is an oblong, with inner corridors on each of the six floors, giving access to the various classrooms and laboratories. The corridors are lit by two spacious areas, while the rooms are lighted externally. Above the entrance-hall, which is of large area, is an examination and public lecture-hall, of about 4,000ft. area; and above this a chemical laboratory. The basement is one great workshop and laboratory for spinning and weaving, mechanical, electrical, steam, and hydraulic engineering. Laboratories and workshops are provided for chemical, physical, metallurgical, sanitary investigations, &c. A good type of laboratory can only be developed by experience in the teaching of pupils, by a study of the requirements, the working at benches, and other apparatus. There are certain dimensions for rooms, bench space, area per pupil, &c., which must be complied with before the shape and size of a laboratory can be determined. In all these structures it is the actual working that must be understood before a design can be made; and it is the fulfilment of those conditions that we look for in the best plans. The practical wants of the occupants must be understood before it is possible to gain an idea of a building. By a standard plan we mean a practical realisation or embodiment of the functions or necessities of the work or business done in a building. Very few structures can be found to fulfil these conditions: the majority are erected by men who do not grasp the work or official duties carried on; the building is a misfit, if it is a factory, the mechanical plant does not fit; if a tradesman's establishment, the interior has to be remodelled; if a public office, every official complains of dark corridors, offices that are difficult of access and uncomfortable. In these days of complex requirements and industries, it is almost impossible to rely entirely on an idea, however good it may be. So the architect must be governed partly by what he has done before, and by his client's wishes. One writer, speaking of standard plans, says, of course he must not copy; it may be that it does not answer sufficiently well the particular wishes of the client. "What is necessary is that the architect, although inspired by the standard plan in its essential lines, should follow the general ideas of his client, and add to the work ideas of his own." The unaided mind requires a guide and direction, and such a good design affords the designer. But he must not copy, however closely the design appears to suit him, and it is this power of being inspired by a standard plan without necessarily following it, and of incorporating with it one's own power of individuality and adaptation, that makes the artist. But it is not everyone who has the insight to select what is good or the most suitable for his purpose. By many, a standard plan is not so easily found. This is why we see so many good copies of bad designs—buildings

in which the architect has taken the greatest pains about the elevation, the sculpture and ornament, but quite missed the opportunity; or the building is an *alla pavida* of various features taken from other buildings. So the worst plans and details may be reproduced. Thus it is that the best buildings are not seen or appreciated by everybody, and they can be only valued by those who have the knowledge of the requirements. There is no royal road to a knowledge of standard plans; the gifted artist with a brilliant idea may be able to solve the problem of design after a slight acquaintance with the work. The illustrious architects of the past were confronted with buildings of single aim and simplicity, as in the temple or the Mediaeval church, or the conventual building, which they could at once grasp; but now the multiplied wants of highly civilised communities living in great towns have rendered it impossible, without considerable knowledge, for the architect to evolve out of his own mind a scheme or plan suitable to any particular want, or to become acquainted with types of building which can be accepted as models.

COURSES FOR STUDENTS.

THE approaching session of the architectural schools and societies which we have entered upon promises to be active upon questions of education and policy. The establishment of a day school by the Architectural Association, which commenced a year or two ago, has been found of great help to the younger members of the profession, and has realised the expectations of the committee. Before entering an office the need of an elementary training in various subjects has been long felt; but there were few opportunities open to the student. The day and evening classes of the Association now afford the pupil the means of studying branches of his vocation which cannot possibly be learned during his term of articles. A year or two spent in the day or evening school will enable him to acquire at a moderate cost those principles which lie at the root of his office training. As a preliminary course we can heartily recommend these opportunities of study. As the committee say in their report, a short time spent in such a school will enable the student to test his aptitude for the profession; it will also be a strong recommendation to architects who wish to obtain pupils that are well grounded in the elements of their work. Every facility is offered by the Association. If an article pupil is unable to attend the day-school every day, he can, with his master's consent, join the classes on at least two days of the week, and attend the evening lectures. The curriculum given in the Brown Book includes such elementary matters for the first year's course as the use of instruments and scales, freehand drawing, elementary perspective, the orders of Classic architecture, and the elements of styles and construction: just those subjects which beginners ought to know something about before they enter an office. The use of instruments, for example, is one of the first things to be learned. We have known pupils waste much of their time in making and reading scales, owing to their ignorance of the simplest method of making them. Quite as important is the necessity of a good drilling in the "Five Orders," which will enable a student to properly apportion his columns and entablature and their chief subdivisions, so that he may avoid mistakes in rendering properly the rough sketches of his master. A knowledge of the elements of construction, such as the proper joints to be shown in timber roofs and partitions, the mode of showing timber plates, joists, &c., the jointing of masonry, brick bond, &c., are absolutely essential in the drawing of the most ordinary section of a building. The lectures on this subject given

in the A.A. elementary course comprise foundations, brickwork, and masonry for the first term, outline of timber and metal construction for the second term, and roof coverings, plumbing, plastering, and joinery in the third term. The history of architecture is also divided into three terms, and comprises thirty-six lectures on the leading developments and styles which are given in the Brown Book, to which we refer the reader. It will thus be seen that the work of the school is divided into a history and a construction side, and these are conducted through the agencies of lectures and studio work, the latter being mainly directed to making the student a good geometrical draughtsman. We refer to the subject now, because the annual course begins in this month (October), which is the most convenient time to enter. The second year's course may be followed during the first year of the pupil's articles, and is so arranged as to afford the student systematic teaching supplementary to his practical office work. This concurrent use of the day-school and office routine will be found of great service in simultaneously instructing the pupil in both sides of his work—the practical and theoretical.

We believe in this combination of the two methods of instruction. For instance, during the second year's course, elementary construction will supplement the pupil's office work, and better fit him to prepare the sections and details he may have to draw in the office. During the second year's course (the first year of the articles) simple subjects in design should be given illustrating the styles previously learned in the lectures. These designs should illustrate the methods of the styles, and in this way furnish the student with a practical side to the lecture course. The geometrical drawing studies should also be given simultaneously or following the course of the lectures. The studies should, in fact, explain them. In the Association day school this order is followed; thus the drawing of the Five Orders accompanies the lectures on Greek and Roman architecture. A small scale plan of a large Roman edifice is also given as an exercise, during this part of the course. Romanesque and Gothic developments of the vaulted roof worked out in plan and section accompany these lectures, thus giving the student an interesting demonstration of these important types of construction and style found in the Roman Basilica, on which so much depends. So in a later term the student is given an example of a vault or two bays of a Gothic church, which he has to draw in plan, section, and elevation, or a traceried window of a certain period is required, so that the student is simultaneously engaged in drawing out a typical example; thus the lecture is illustrated in every case. It is important also that the lectures on construction should be illustrated by a drawn example. For this reason a small building, say a cottage, is given, drawn out to an inch scale, with details and specifications, and the lecturers explain the construction and mode of procedure. In such a matter as vaulting, a series of lectures, illustrated by diagram, will give the young student very little insight into the problem; but if the student has to draw the vault geometrically as well as he can with proper aid, the subject becomes of intelligent interest to him.

The history and the construction drawing work, if carried on in parallel lines, afford the student just that relief from the dull monotony of the classes or the studio which is so helpful. Each period or style is learned or engrafted on the mind of the student, as his attention is aroused by the drawing of an actual example. The second year's course at the Association includes principles of architectural design and perspective and sciography—two important subjects.

One of the faults of architectural training

is the tendency which pupils show of copying from the flat. The flat copy is placed before them, and in the ordinary schools it is inculcated. Drawings of buildings in the flat, elevations plain or shaded, are copied without restraint till the student gets into the habit of studying design simply from these means of representation without attempting to realise the solid form of buildings. One of the best methods of counteracting this habit is to instruct the student in modelling. The practice of "thinking in the solid," or in three dimensions, is of the utmost advantage in teaching design, to prevent the designer getting flat, and to instruct him in the power of perspective effect, of return sides, of recessed parts and sculptural detail. How is it possible by means of geometrical drawings, front and side views, say of a perch or a centre, or a tower, to adequately realise the executed effect? A perspective may help us to do so to a certain extent, and this is its value as a subject; but it does not impart to the student the power of adapting and adjusting the front and sides such as those of porches, gables, pediments, towers, roofs, and other features, and to mould his masses to the best advantage. In the Continental schools of architecture, as well as in those of the United States, the subject of modelling occupies an important place in the curriculum.

The first two years of the young student's training, including the commencement of his pupilage, are of the utmost value, for it is during this period the student begins to feel his aptitude and to discover his resources for his vocation; therefore, it is necessary during this time to lay the foundations of his future career. Instruction in design that will enable him to give form and character to his buildings, to apply the features and details of the best periods to his work, following the historic development of art is of importance. To teach design in its application to simple and everyday buildings ought to be the main endeavour of the masters. In London there are many opportunities and advantages for such a supplementary aid to the art-learned pupil: he has lectures, studios, classrooms, workshops, museums, libraries, visits to buildings in progress open to him if he cares to avail himself of their opportunities. But the pupil in London, if he does not bring himself into touch with these facilities, is really worse off in some things than the pupil in the country office, who has at least more opportunities for visiting buildings in progress and the workshops of building firms, and who is often more benefited by his master and his colleagues. The master often takes greater interest in his pupil's advancement than is the wont of the London firm, where things are managed more in narrow grooves. In a large drawing-office, for instance, of a London firm, the young pupil is kept to very mechanical and routine work for a considerable time; and if he does not attend classes or evening or day schools, he comes out of his office very little better than a mechanical draughtsman, with very limited ideas of construction, materials, and methods of work. In the North, the Leeds and Yorkshire Architectural Society have been endeavouring to supply the younger men who are members of their society with school of architecture. We are told by the *Yorkshire Post* that this society has been engaged in founding an approximation to a school in which students may fit themselves for the profession, and prepare for the Preliminary, Intermediate, and Final examinations of the Institute. Owing to lack of finances, the promoters cannot endow chairs of architecture as done in Manchester and Liverpool, so the Yorkshire society has had recourse to the expedient of utilising existing classes at the Yorkshire College and the Leeds Institute in conjunction with classes that are to be specially organised at the in-

stitute and the society's headquarters, to cover the whole course of architectural study." Indeed, until lately, there were no facilities for organised study offered to the architectural student; but how many other parts of the country are similarly situated? These are additional reasons why the legal registration of the profession is a question of immediate concern to it. In the mean time what the Yorkshire Society has done to organise classes to cover the whole of study, may very well be followed by other architectural societies. The pupil may very well learn much of practical construction in the classes of colleges where engineering subjects are taught, while in the subjects of design and history special courses could be given at other institutes. Classes can be established as the Yorkshire Society has done, for the subjects set in the R.I.B.A. examinations, so as to cover the whole field necessary for the student. The syllabus should be of a thoroughly practical kind. Historical examples and modern building problems should be learned on principles of design, and these should be given in parallel courses. But in every case the student should be left quite free to work out his own ideas; that no definite direction be imposed upon him in matters of taste, so that he may fully develop his own individuality.

A DEPARTMENTAL REPORT ON HIGHWAYS.

THE report of the departmental committee appointed by the President of the Local Government Board to inquire into the subject of highway authorities and administration in England and Wales has been issued this week. The committee, as appointed on March 18 last, with Mr. Grant Lawson, M.P., as a chairman, was directed to inquire into the general condition and sufficiency of the roads in England and Wales, and to report whether any, and if so, what, amendment of the law relating to these matters or its administration is desirable in view of the various purposes for which the roads now are or shortly may be utilised; and particularly whether any change of the authorities who have control over the roads or of their powers is required. The committee deal with the defects of the present system, and recommend that many of the smaller district councils should cease to exist as highway authorities, and that their duties in this regard should be taken over for the sake of economy by the county councils. In the case of the more important roads, at any rate, local sentiment should not be allowed to prevail. Instances are given of friction between different highway authorities, and the committee consider that this friction would be removed, and greater uniformity, economy, and efficiency secured, if it were possible to place the maintenance and improvement of all the principal roads in a county under the direct control of a County Highway Board, representative of all the authorities having at present rights and powers with regard to main roads. The committee consider the system of County Highway Boards as ideally the best possible under the existing conditions of Local Government in England and Wales, but they admit that its adoption would involve the solution of some intricate problems with regard to proportion of representation upon the boards, and to finance. They recommend some fourteen amendments of the present system, which they think would meet with very general approval. Some of these amendments would be rendered unnecessary if the system of County Highway Boards were adopted, but if that is found to be impossible, the committee recommend that they shall all be made. The amendments referred to are concerned for the most part with details of the administrative changes that would be necessary under the scheme, especially the making of agreements between the county highway boards and existing authorities for the maintenance of main roads and other highways. The consolidation of highway law is recommended. County councils have in some highway matters actually smaller powers than other highway authorities, and it is urged that this should be remedied. There are, however, some roads which the committee regard as entitled to be regarded as national roads, as distinguished from the county roads of

the county highway boards. On these "long distance through traffic, as compared with traffic which is local to the district or even to the county, will become of more importance every year with the development of new forms of traction. The cost of maintenance of trunk roads for such traffic appears to be a matter for national rather than for local or county provision. The selection of the roads which should be regarded as forming part of such trunk roads, and should be specially subsidised by the State, might well be left to the authoritative body suggested by the Royal Commission."

The report contains many observations and recommendations on such matters as the sufficiency of roads, widening, alternative routes, tramways and light railways, road openings, damage by traction engines, roadside wastes, and records.

CARPENTRY AND WOODWORK.

VOLUMES IV., V., and VI. of "The Modern Carpenter, Joiner, and Cabinetmaker," published by the Gresham Publishing Company, have now been issued under the editorship of Mr. G. Lister Sutcliffe, A.R.I.B.A., architect, and, like the previous parts, to which we have already directed attention, are copiously illustrated by diagrams. Volume IV. is devoted to the strength of timber and timber framing. The editor contributes a useful essay, under section 7, on Carpentry, detailing joints in tension, tension-compression, and transverse stress, with particulars as to scarfing and lengthening timber. Built-up and trussed beams are likewise dealt with, sketches showing the special points described. The same section is continued in Vol. V., following up the more individual items of carpentry with general plans of roofings, from the ordinary square, pyramidal, or hipped roof to complex and irregular roofings as contrived over buildings which occupy awkward sites. Spires, too, are included in the treatise, with turrets, steeples, as well as the shaped octagonals. Domes naturally are associated with this part of carpentry, and the author shows how to plan, set out, and construct spherical and ellipsoidal domes, vaults, and pendentives. Laminated roof constructions find a place for cheap sheds in big spans. There are among historical and ornate examples some sheets of Hampton Court Great Hall and of Westminster Hall. These plates, however, have a very old-fashioned look with their fine lines and machine-ruled hatching. The last volume has just come to hand, and in it Mr. Sutcliffe deals with floors and beams, including projecting galleries. The plate of Birchcliffe Chapel Gallery shows how steel bearers may be worked in combination with transverse joists stepped in stagings for seatings. Ceilings and soffits and groins come next, and then trussed partitions with openings in a variety of positions. The subject is elaborated in connection with framed buildings and colonial wooden erections, and also American houses. Half-timber work, too, from a carpenter's standpoint is described. The timber porch from South Hayling Church is a capital example of its kind, and makes one of the best drawings in the volume, recalling a sheet of sketches given in the *Building News* by Mr. Maurice B. Adams, many years ago, of the same subject. The plates of timber bridges have the appearance of being reproduced from some previous publication, and seem familiar, though perhaps none the less useful.

Mr. Harry Hems contributes a chapter on wood-carving, written in his customary graphically descriptive style. He ventures the admission that there is not a more conceited set of men than figure carvers, and illustrates this opinion by printing a sketch of a carver at work in the year of grace, 1452, reproduced, he believes, from an old illumination. He comes to the conclusion that egotistic chisellers are not entirely the creation of the present day. Mr. Hems shows us probably the oldest specimen of wood-carving extant. It is a sycamore statuette of an Egyptian, and is now in the Guizeh Museum at Cairo; it was made, so they say, 4,000 B.C. The writer takes the reader through subsequent periods, and gives some excellent photographs of works which are associated with his own name from various parts of the world. He assures the reader that he never read a technical book on wood-carving, and has no sympathy or knowledge of those who attend "wood-carving classes." Without possessing more than a very little general acquaintance of the craft, he has been unconsciously

Cross Sections Showing Arrangement and Connections of Reinforcement Bars in Cleveland Intercepting Sewer.

accumulating knowledge during the fifty years he has been in the trade. The result of his success is here put down under a highly entertaining chapter of practical notes. When, at the outset of his career, Mr. H. Hems was put to work, after his indentures were signed, a little, bandy-legged, bleary-eyed boozier of a man, working at the next bench, said to the lad: "So you're apprenticed, are you? Well, you'll serve your time to poverty." The speaker himself, devoted to "St. Monday," died in the workhouse. Mr. Hems thanks God, saying he has no reason to regret the step taken when he was put to carving, and believes that "few men have been happier or more successful." No one interested in the craft can read Mr. Hems's suggestive chapter without gaining many useful hints and practical tips. He deals with tools and benches, studios and shops, chisels and gouges. Illustrations of a font cover, Chipping Barnet Church, Hertford, and of some pretty stall ends at All Hallows, Barking, show the class of work which the author has had to do. From the same church he gives a good photograph of Grinling Gibbons' font cover, and we have some drawings, too, of four misereres from Exeter Cathedral; also an early crucifix from Lucca Cathedral. The essay concludes with a poem.

A CONCRETE-STEEL SEWER.

THE main intercepting sewer for the city of Cleveland will extend along the lake front to a point about nine miles from the centre of the city. About $3\frac{1}{2}$ miles of it, which is now under construction at a cost of over 1,100,000dol., is 13ft. in diameter inside, and is being built of concrete reinforced with longitudinal and transverse steel rods of the Parnley patent system, two forms of which are used in different parts of the sewer. A section about two miles long is from 35ft. to 44ft. deep, and only 17ft. in the clear away from the centre line of the Lake Shore and Michigan Southern Railway tracks. This portion is being built in open trench, and is shown by the cross-section of intercepting sewer. Water and quicksand were encountered, and the requirements of the railroad company regarding interference with tracks and trains were so severe that continuous lines of 9in. sheet piling 28ft. long were first driven by steam-hammers on both sides of the sewer, and afterwards excavation was made between them by cable machinery, and the piles were braced with 10in. by 10in. and 8in. by 8in. cheek and strut timbers put in as required. Below the 9in. sheet piles one set of ordinary sub-sheeting and bracing was driven into dryer material consisting of very fine sand and blue clay.

The trench was pumped dry, and a massive concrete invert was built in it and lined with two courses of shale brick. Two staggered rows of 2in. by $\frac{1}{2}$ in. soft-steel anchor-bars, 15in. apart on

centres, were built into each side wall and projected above it to receive the main tension bars. The centrings for the arch were set in the usual manner, and the lagging was covered with building paper waterproofed with paraffin. This was accomplished without any difficulty because the tension bars were not yet in place to cause obstructions, but after the centring was prepared 2in. by $\frac{1}{2}$ in. curved transverse bars were bolted to the anchor-bars so as to make an inner and an outer skeleton, the first adjacent and parallel to the intrados, and the second flattened on top at the level of the crown. To these bars were bolted eight lines of horizontal longitudinal $\frac{1}{2}$ in. by $\frac{1}{2}$ in. bars. Portland cement mortar 3in. thick was then laid on the lagging inclosing the inner row of bars and forming a finished surface for the arch soffit through which none of the concrete stone could penetrate. Before this mortar set, concrete was rammed in between it and the sheeting to a height of 18in. above the springing line, and the remainder of the concrete was rammed in place against the 3in. of mortar without the use of outside forms. The upper surface of the concrete was finished with 1in. of Portland cement mortar. The arch concrete was made 1:3:7 with $\frac{1}{2}$ in. screened broken stone. Where voids in the stone exceeded 40 per cent., the proportion was made 1:3:6. Back filling was commenced as soon as the concrete was from six to twelve hours old, but the centres were not removed for two weeks. The paper lining was then pulled off, leaving a surface so much smoother than brickwork that it was calculated to increase the carrying capacity over that of an ordinary brick-lined arch by about 15 per cent. Where the arch was back-filled with 25ft. of clay and wet quicksand, the total depression of the crown was not more than 0.06ft., and the corresponding increase in the length of the horizontal diameter did not exceed 0.08ft., although in some places the sheeting was forced in so as to reduce the thickness of the side walls 3in. A steel arch section 12in. thick, 2ft. long, and having a diameter of 14ft. 9in., was subjected to a load of 57,000lb. when tested to destruction.

The Gilbert-street section of the sewer is about 2,000ft. long and from 24ft. to 30ft. deep. Here round bars instead of flat ones are used for the reinforcement, are hooked instead of bolted together, and are arranged on a different system of combined primary and secondary bars. The primary bars are nearly horizontal at the crown, where they pass near the intrados and thence extend through the arch to the extrados along the haunches and then back again through the arch to the intrados, where they are anchored to the vertical side-wall bars 2ft. above the springing line. These bars are calculated to take tensile stress, but do not afford sufficient reinforcement to the crown, where the tensile strains extend down about 40° on each side, and are further provided for by the secondary bars which alternate with the primary ones, and are bent to

segmental curves with their ends radial so as to lock thoroughly into the concrete. Both sets of bars are $\frac{3}{4}$ in. in diameter, and are 6in. apart on centres at the crown. The $\frac{1}{2}$ in. longitudinal horizontal bars are wired to the transverse bars at intersections. Short vertical bars are built into the side walls at the springing line to resist the tendency of the completed sewer to spread and to prevent the side walls from being forced inwards during construction.

Eight sections of the main interceptor are under contract by this Parnley system, aggregating $3\frac{1}{2}$ miles in length, and contain about 60,000 cubic yards of concrete, 1,700,000lb. of steel, 12,000 cubic yards shale brick masonry, and about 350,000 cubic yards of excavation. It is being built for an average contract price of about 62dol. per linear foot, as compared with about 75dol. per linear foot bid for ordinary brick construction. About $3\frac{1}{2}$ miles of other sewers varying from 5ft. to 12ft. in diameter inside are now being constructed in Cleveland on this system at an aggregate cost of about 540,000dol. By comparative bids for sections 1, 2, and 3 of the intercepting sewer, above described, a total saving between the cost of an ordinary brick-lined concrete sewer and the concrete steel sewer with the invert only lined with brick aggregated over 78,000dol., equivalent to from 19.7 to 22.4 per cent. of the cost. The sewers were designed and construction is superintended by Mr. Walter C. Parnley, M.Am.Soc.C.E., assistant city engineer in charge of sewers.

STEEL CONCRETE.*

STEEL concrete construction is being largely used in this country, as it has been on the Continent and in the United States. The incorporation of the two materials has gone under several names—"armoured" concrete, "reinforced" concrete, "ferro" concrete, &c. Doubt have arisen about its use for beams, floors, arches and tunnels, &c.; the question of the adhesion between the steel and concrete, whether it withstand shocks, resist corrosion, whether its mass not objectionable, have been mooted. The author of "Notes on Steel Concrete," Major J. Winn R.E., has written on the subject for the information of his brother officers who may have to use concrete. The author takes as the basis of his pamphlet "Le Béton Armé," by M. P. Christophe, a work recently published, which reviews the whole question and describes the application of reinforced concrete in France, Germany, Italy, and other Continental and American States. M. Christophe quotes experiments and opinions of various authors, and his work is an authority on the subject. Major Winn discusses the different methods of concrete

* Notes on Steel Concrete. By Major J. WINN, R.E., Instructor of Construction, S.M.E. Chatham: W. Mackay and Co., Ltd.

construction and the various forms of "armouring," after preliminary remarks on the resistance of the materials. Very high powers of resistance have been reached. It is stated that 6,000lb. to the square inch has been attained with 3 to 1 concrete at the end of a month. M. Christophe, after discussing the question at great length, arrives at the conclusion that with 1 to 5 concrete, made of slow-setting Portland cement with an aggregate of sand and crushed stone (passing an inch gauge), the resistance is 2,100lb. after a month. Resistance to tension, shearing, adhesion are discussed, and the resistance of the armature or metal is put at 8,500lb. per square inch for iron, and for steel 12,800lb. for first-class structures. The author quotes the remark that if iron and steel is effectually covered with Portland cement mortar or concrete, it will be completely protected from corrosion, and brings other evidence to show that steel imbedded in the concrete is quite safe. Other remarks refer to water-tightness, fire-resistance. Referring to the forms of armouring, the author says round rods are found to have better adhesion than square, unless the square rod is twisted, as in the Ransome system. Flat bars are less adhesive than square bars. Reference is made to the "expanded metal" reinforcement and its many advantages, which forms a good "key"; its adhesion is perfect, while the labour of fixing is less than that of rods; in flooring also it has some advantages over the single tensional rods. Systems of construction are next dealt with. These are treated under the head of (A) slabs, (B) steel concrete beams, (C) arches, (D) walls, (E) pipes, (F) piles. Of the former the systems after the names of their inventors, Monier, Golding, Hyatt, Ransome, Hennebique, are fully discussed; but we do not enter now into this part of the author's work. Each system is mathematically investigated, and its merits and defects pointed out. In the Hennebique system, which has been favourably entertained, the stress on the concrete is assumed to be uniform in all the compressed parts, and that the moment of forces in compression equals that of the forces in tension. These assumptions are said to be false by M. Christophe—a point which the author treats at some length. The pamphlet embodies a large amount of information in a condensed and useful form, which has been thoroughly threshed out.

ON BUILDING TIMBERS.—XXXVIII.

MEASUREMENT—PRELIMINARY.

ON the threshold of this subject it is well to have a clear understanding of a few simple facts in common arithmetic; for these, in being overlooked by practical men, sometimes lead to rather amusing results in everyday work. It is quite a common thing, for instance, to hear a builder—or, for that matter, a surveyor—talk of multiplying 1ft. 8in. by 2ft. 4in., or some other dimensions in common use, as if such a thing could be done; and when its possibility is challenged, a simple calculation is promptly made showing the product to be 3ft. 8in. and ten parts. Now, if the person who supplied this answer was asked to multiply 2s. 6d. by 4d., he would say the proposition was absurd; yet he did not hesitate in the first case, for he had always worked "cross multiplication" without giving a thought to the nature of the process he was engaged upon. When a person says he multiplies 1ft. 8in. by 2ft. 4in. he talks nonsense, for it is as impossible to multiply these lengths as it is to multiply the cash amounts already mentioned. What was really done in squaring the above dimensions was merely multiplying the number $1\frac{2}{3}$ by $2\frac{1}{2}$, so as to obtain figures which would be the exact number of feet, inches, and parts in a certain surface. To see the impossibility of multiplying feet by feet, or inches by inches, it will be only necessary to confine the operation to linear measurement only, for a slating batten 12ft. long cannot be multiplied by one 3ft. long, any more than 12 pence can be multiplied by 3 pence; in fact, neither one proposition nor the other conveys any intelligible idea whatever to the mind. The difficulty in the matter is solved by remembering that numbers are of two kinds—namely, abstract and concrete, and although abstract numbers may be dealt with according to the ordinary rules of arithmetic, it does not seem possible to deal with concrete numbers even of the same kind in a way to admit of any intelligible meaning. Abstract numbers are those which are considered without reference to any things what-

ever, be they units of measure—such as feet or inches—or the articles measured. Concrete numbers, on the other hand, always express some kind of things—such as feet, inches, ladders, barrows, &c., and in all cases of squaring dimensions numbers only are multiplied, though in ordinary work this is not considered, as the operator, by a mental process, substitutes the things enumerated for the figures dealt with in enumerating them. Everyone engaged in building operations is familiar with the fact that there are three distinct kinds of magnitude—length, area, and solid content; length having one dimension only, area two dimensions—length and breadth; and solid content three dimensions—length, breadth, and depth. The unit of length is always a straight line of fixed length, and the length of any line is defined as being so many of these units, and fractional parts of the unit, if necessary. The unit for the width of board measurement is the inch, and that for the board's length the foot, the former being a sub-multiple of the latter. The distance of the sun is not expressed in inches or feet: a million miles is the unit of measure in this case, so that the unit of measure is generally selected with relation to the magnitude of the line measured; but it is always a multiple or sub-multiple of the primary unit of length. An imaginary square, the side of which is a unit of length, is adopted as a measure of surface, and the area of any surface is determined by the number of times the square unit is contained in it. Whether the surface is triangular, rectangular, rhombic, or circular, its content is always expressed by the number of square units found in it. A cube, the edges of which are each a unit of length, and the sides each a unit of area, is the solid used for the measure of cubical content. This cubic unit is used to measure a sphere or any other body bounded by a curved surface, as well as bodies bounded by plain surfaces. From this it follows that if a number representing the length of anything is multiplied by an abstract number, the quotient will be a number representing length. For instance, if a slating batten 12ft. long is multiplied by 3, the result will be 36ft. of batten; but if a number representing length is multiplied by another representing length, the quotient will be a number representing a surface. Similarly, if a number representing a surface is multiplied by another number representing a surface, the quotient will be a number representing a solid. All these processes may be inverted: a number representing a solid divided by an abstract number will give one still representing a solid; but if the first number is divided by another representing a line, the quotient will be a number representing a surface; but if the divisor represents a surface, then the quotient will be the length of a line. It is therefore plain that when concrete numbers are multiplied or divided by abstract numbers, the kinds of magnitudes of the former remain unchanged; but when concrete numbers are multiplied or divided by concrete numbers, the kinds of magnitudes are invariably altered. The unit of length has been defined as a straight line of definite length; but when it is asked what is a straight line the trouble begins, for "Euclid" defines it to be "that which lies evenly between its extremities," these being points. As a point is merely position without magnitude, a line length without breadth, and a surface length and breadth without thickness, it follows that no one has ever seen what Euclid calls "points," "lines," or "surfaces." This statement will, no doubt, surprise a good many who think that all through their lives they have had the evidence of their senses to the contrary. Nevertheless, not only have they never seen such things, but they will find it quite impossible even to conceive of their existence, for the mental picture of a point must have some dimensions—that of a line some width and of a surface some thickness; yet all these properties are rigidly excluded by Euclid's definitions. Geometry deals with points, lines, surfaces, and solids; and it is claimed for it, as for every other branch of mathematics, that it is an "exact science," and that its deductions are "necessary truths." Mathematicians, who are prone to upset everybody and everything, themselves, and their own "necessary truths" included, assert with the utmost dogmatism that Euclid's definitions are illusive. They say that, though his generalisations are undeniable and his conclusions unimpeachable, his whole system is built on mere hypotheses which are not necessary, are not true, and which purposely depart from the truth, seeing that there

are no real things existing anywhere which correspond to his definitions, not even in our imaginations.

What is clear enough to one person may be wholly unintelligible to another, and as an experiment will often demonstrate what words will never make plain, the reader who has any difficulty in following Euclid's meaning may try to obtain a Euclidean surface, and the effort will probably convince him that the philosophers may be right after all. The most promising way to go about manufacturing it will be to obtain a nice thin board and a well-sharpened joiner's plane. The board will, of course, have an upper and under surface, and the work to be done to satisfy Euclid's definition is to plane away so much of the board that one surface only shall be left. Having placed the board on a bench and commenced work the original upper surface is soon removed, but another has taken its place. The board is certainly thinner; it is, however, a solid with two surfaces, and the planing must be continuous until the lower surface only remains. When that is done, a geometrical surface will be the result and its boundaries will be lines terminating in points. The absurdity of the attempt will soon convince anyone that Euclid's definitions of lines, points, and surfaces are, after all, mere generalisations based on natural objects with which most people are familiar, and that these generalisations are adopted merely to enable the mind to deal with a subject which, without them, would be incomprehensible. Leaving mathematicians and philosophers to settle their differences, it will be necessary here to deal with points, lines, and surfaces of a tangible kind, and such as may be seen and handled—not forgetting that the smaller the point the finer the line, and the thinner the surface the more accurate will the work be where these are used as guides, whether in the office, on the building, or at the bench. A straight line was neatly defined about 2,200 years ago to be the shortest that can be drawn between any two points, and as no shorter line has been discovered since, it is the kind of line that will be invariably referred to here. To understand clearly what follows, it is necessary to examine another definition of Euclid's—that of parallel lines, for they bound the units of surface measurement, as well as of solid content. Parallel lines are those which, being in the same plane, do not meet even if they are extended ever so far both ways; such lines are the joints in floor-boarding. Now, where straight lines are in different planes, the question of parallelism does not arise; the joints in a floor could never be parallel to the joints in the papering on the adjoining wall. On a building one straight line is set out parallel to another by making them the same distance apart, this distance being measured in a direction exactly at right angles to both lines. As philosophers dispute the accuracy of Euclid's definitions of points, lines, and surfaces, so physical scientists are sceptical about his parallel lines. They say that, although our space is tridimensional, the dimensions being length, breadth, and depth, there is somewhere in the universe space of more than three dimensions, the possible number of which they represent by the letter " n ," and that parallel lines do meet in space of that kind. It is not an easy matter to understand this conundrum, but it has some value, for it goes to show that belief without understanding is not a special characteristic of the theological mind. In this world of ours, where parallel lines do not meet, the nearest approach to space of more than three dimensions is to be found in a builder's account for extra work, the possibilities of which may well stagger any mathematician, or even an " n " dimensional philosopher. In this connection one other expression which will be frequently used in subsequent explanations may be defined—namely, the word "angle." When two straight lines diverge from a point they form an angle; the magnitude of which has nothing whatever to do with the lengths of the diverging lines, as it is determined solely by the mutual divergence of the lines. The point where the lines meet is the vertex of the angle, and if a circle is struck with this a centre and a radius of any length, the proportion which the arc included between the diverging line bears to the whole circle, determines the magnitude of the angle. The ancient Egyptians who had 360 days in their year, divided all circles into 360°, and we continue the practice to the present day. The number 360 is a convenient one, for it can be divided without remainder by 2, 3, 4, 5, 6, 8, and 9, and no decimal division

would have allowed of this. In squaring dimensions, "duodecimals" or "cross-multiplication" is used, and these terms are taken by most people in the building trade to mean the same thing, but they do not. To understand this thoroughly it is necessary to know what "duodecimals" really means. The method adopted to express numbers is called notation, and the decimal system is that at present in universal use, for every number may be expressed by nine figures or symbols and a cipher, that is by 0 and the figures from 1 to 9, both inclusive. Whole numbers are always, by the illiterate as well as by the learned, expressed in decimal notation. Take the number 365, for example: in it the 6 stands for 60 and the 3 for 300. In 3,065 the 3 stands for 3,000, the 6 for 60, and the 5 for units as before. The cipher shows that there are no odd hundreds, and it serves to make the 3 stand in the place of thousands. In this, the common kind of notation, the first figure on the right hand denotes its fixed value, the next ten times its fixed value, and so on. Whether therefore fractional parts are expressed decimally or otherwise, all whole numbers are invariably arranged on the decimal system. The symbols which constitute any number are called its digits, and the number itself is equal to a series of powers of 10 multiplied successively by its several component digits. The number 3,065 in this way is equal to $3 \times 10^3 + 6 \times 10^2 + 5$; the number 10 is said to be the radix of the scale. In duodecimal notation 12 is the radix of the scale, so that two new symbols are required to represent the numbers 10 and 11; as there are none in common use, the letters "t" and "e" may be taken to express them. To make this quite clear, let it be well understood that in decimal arithmetic the value of a figure is increased ten times by being moved one place to the left, or diminished tenfold by being moved a place to the right; but in duodecimal arithmetic the value of any figure is increased twelve times by being moved a place to the left, and is diminished twelvefold by being moved a place to the right, and this is in dealing with whole numbers only. It has been shown that in common notation 365 denotes $3 \times 10^2 + 6 \times 10 + 5 \times 1$; but in duodecimal notation 365 would mean $3 \times 12^2 + 6 \times 12 + 5 \times 1$, which in common numbers would be 509. To reduce any ordinary number to a duodecimal, divide the number by 12 and note the remainder, divide the quotient again by 12 and note the remainder, and so on, until the quotient 0 is obtained, noting the remainders in each case; the duodecimal required will be the remainder written down in reversed order.

Suppose it is necessary to express 15186 in the duodecimal scale—

12)15186 Here 8596 is the number.

12)1265—6

12)105—5

8—9

Suppose, again, it is required to know the duodecimal of 221323—

12)221323

12)18443—7

12)1536—e

12)128—0

12)10—8

0—t Ans.: t80e7.

Suppose, now, it is necessary to reduce 8956 in the duodecimal scale to the ordinary or decimal scale: Multiply the first figure of the duodecimal by 12, and add the second figure; multiply this sum by 12, and add the third number, and so on, multiplying by 12, and adding the next figure till the last is reached. The result thus obtained is the equivalent number in the ordinary scale.

For example, let it be required to reduce the duodecimal 8956 to the ordinary scale:—

8956

12

105

12

1265

12

15186

Here 8, the first figure, is multiplied by 12 and

9 added; the result is multiplied by 12 and 5 added, and the result is again multiplied by 12 and 6 added; the last result, 15186, is the number required. Taking the other duodecimal given above, it may be reduced in the same way:—

t80e7

12

128

12

1536

12

18443

12

221323

In this case, the first figure "t," or 10, is multiplied by 12 and 8 added; the result is multiplied by 12 and nothing added. In the next operation the result is again multiplied by 12 and "e," or 11, added, and so on until the final result is 221,323, the number required. Suppose now that this duodecimal arithmetic is applied in practice—say, for instance, in multiplying 17ft. 5in. by 13ft. 7in.; here it will be necessary to reduce the 17 and 13 to the duodecimal scale—

12)17

12)13

1—5

1—1

17 therefore becomes 15, and 13 becomes 11, the answer is then worked out thus—

15.5

11.7

t1e

155

155

178 6e

Reducing 178 from duodecimals to ordinary figures it will be 236, so that the answer is 236ft. 6in. and 11 parts. Perhaps it may be well to describe this process more minutely. In the calculation given above 7 is first multiplied into 5 which gives 35; this divided by 12 is 2 and 11 over, this latter number is written "e" and 2 carried; 7 times 5 are 35 and 2 are 37, which, divided by 12, is 3 and 1 over; 7 by 1 are 7, and 3 added makes 10 (written t), and so on with the other figures. In the addition, "e" is brought down, next 6, and in the third row, 5 and 5 are added to "t," or 10, they make 20, which divided by 12 leaves 1 and 8 over, this last is set down and one carried, and so on. The 178 is reduced to an ordinary number thus—

178

12

19

12

236

Now when a surveyor or builder squares dimensions, by "duodecimals," as it is called, do either of them work out the calculation in this way: Not one! So that what is called in the profession "duodecimal arithmetic," is nothing of the kind, it is rather a mongrel sort of calculation, the whole number being one of the decimal scale, and the fractional parts of a foot (in twelfths) being duodecimals. If, in squaring dimensions all denominations were inches, 12ths of inches, 12ths again, and so on, they might be multiplied thus—say it is required to know the contents of a surface, 3in. 4pts. 3sec. by 2in. 4pts. 4sec.

in. pt. sec.

3 4 3

2 4 4

6 8 6

1 1 5 0

1 1 5 0

7 11 0 5 0

this is ordinary "cross multiplication," but the same result may be obtained duodecimally thus—

343

244

1450

115

686

76050

here the result is the same 7in. 11pt. 0sec. 5 thirds. It will perhaps surprise many to know that whilst

the decimal scale is held up as being perfection by some, it is considered by others as very much inferior to the duodecimal scale described above, for the number 10, the radix of the decimal scale, has only two aliquot parts, whilst 12 has double the number. This explanation of duodecimal arithmetic may be closed by giving an example of ordinary cross multiplication and the same by the contracted notations.

Multiply ft. in. pts. sec.
By 4 8 6 5
3 4 9 8

14 1 7 3
1 6 10 1 8
3 6 4 9 9
3 1 -8 3 4

16 0 4 11 2 0 4
ft. in. pts. sec. 3rds 4ths 5ths

By contracted notation:—

4 8 6 5 or 4 8 6 5
3 4 9 8 3 4 9 8

3 1 8 3 4 1 4 1 7 3
3 6 4 9 9 1 6 t 1 8
1 6 t 1 8 3 6 4 9 9
1 4 1 7 3 3 1 8 3 4

In squaring dimension—where in lineal measure inches are mentioned—they are, of course, the twelfth part of a foot; but in superficial measure an inch is really 12 square inches, and in cubic measure an inch is 144 cubic inches; so that the expression 12 feet 5 inches board measure really means 12 feet 60 inches, for there are 144 inches in a superficial foot, and 12 feet 5 inches in cubic measure is 12 feet 720 cubic inches, for there are 1,728 cubic inches in a cubic foot. Building timber is usually formed and measured in well-defined geometrical figures, and a few of these will embrace all the forms ever likely to require solution at the hands of the measurer. In fact, the architect and surveyor seldom deal with any but rectangular surfaces, or solids bounded by such surfaces. The timber merchant, however, deals with cylinders and truncated cones, so he has to call in the aid of "Hoppus" to assist him in solving them. Before dealing with the various ways of measuring timber adopted by the trade, or the standards in use, it will be necessary to explain how simple areas and contents in solid measure may be obtained. The area of a square is obtained by multiplying the length of a side by itself—"squaring" it, in fact. The side of a square is obtained from the area by extracting its square root, and the diagonal by multiplying the side by 1.4142. The area of a rectangle is obtained by multiplying the length by the breadth; if the area is divided by the length the side is found, and the area divided by the side gives the length. In a parallelogram, the area is the length of the side multiplied into the vertical height (not the slant height). Triangles seldom occur in timber measuring: when they do they may be estimated by rectangles, the base being the side and the width half the vertical height of the triangle from its base. A triangle is equal in area to a rectangle on the same base, and half the vertical height. To compute the area of a circle, multiply the square of the diameter by .7854; or multiply the square of the circumference by .07958; or multiply half-circumference by half-diameter; or square the radius and multiply it by 3.1416. The surface of a sphere is obtained by multiplying the diameter by the circumference, or multiplying the square of the radius by 12.5664, or multiplying the square of the diameter by 3.1416.

PRACTICAL MASONRY.*

WE gave a short notice of Mr. William R. Purchase's work on "Practical Masonry" on its first appearance, so that it is not now necessary to add very much more to our previous remarks. The author lays no claim to deal with the theoretical principle of stonemasonry or its architectural character, but confines himself to introducing the student to the practical work of masonry and to initiating young beginners. The author writes as an operative stonemason who had

* Practical Masonry. By WILLIAM R. PURCHASE, Builder Inspector to the Borough of Hove. Fourth Edition. London: Crosby Lockwood and Son.

AN OLD GERMAN TABLE AND CHAIR.

reached the rank of foreman mason, and for this reason his work is thoroughly practical in its method. The cases commonly met with on buildings are selected, and the examples are chiefly from actual work. Tools and appliances naturally occupy the first place, and these will be found to include all the tools generally used—hammers, chisels, “boasters,” claw tools, pitchforks, jumpers, picks, axes, each being illustrated. Other plates, illustrate the manner of splitting blocks of stone by wedges, &c. Arches and joints are described and illustrated by several diagrams showing the concealed joint used in piers and architraves, joints used in landings like the joggle, the rebated joint, horizontal and right-angle and rebated bed-joints to stone spires, &c. The method of forming a plane surface on a rough block is illustrated by the method of “boning” pegs or cubes of hard wood placed at the corners of block, upon which straightedges can be placed for “boning” or sighting. The superfluous roughnesses are then pointed off, and the surface dressed to a finished face. The useful sample of working a length of cornice out of a rectangular block is clearly illustrated by isometrical diagrams showing the processes of working the beds and joints, scribing the mould of the arch or moulding, chiselling out the sunk parts, setting out the entasis of columns, the method of finishing or enlarging mouldings, the setting out of working of stone stairs, stairs with winders, development of the plan of stairs with winders, the mode of setting-out winding stairs, are noted. These processes are shown in four plates drawn to a good scale. Four other plates illustrate circular work, a terrace stair and balustrade, or “ramp work, a twist.” The method of working the blocks showing the bed and face-moulds of plinth and coping is clearly described. Arches, circular plain, with large scale diagrams of developments, working the stones, circular arches in cylindrical walls, niches and skew arches are fully explained and illustrated also. Cylindrical coping, the masonry of domes and pendentives, joining form other chapters, and good examples of worked out. These and other parts of the book were given in the early edition. Gothic buildings of the different periods are illustrated, and form a useful summary of mouldings and arches, followed by a précis of Grecian and Roman mouldings. We now come to the sections dealing with masonry estimating, and quantities, and a useful list of

building stones in the market. The author makes some useful remarks on the quantity surveying of stonework. Our readers know there is great diversity in estimating stonework or the labour on it. The author says: “At one time half-sawing was taken on all the six sides of the cube, and any labour expended on these sides or faces was added; but now what is called the ‘London system’ of measuring being generally adopted, half-sawing is ignored, except for the back of the stone built into the wall, it being assumed that all other labours include the price of sawing.” The author refers to Mr. Leaning’s method, which is to take out the stone including labour, and to divide it into a few main items each composed of stone, upon which the labour is similar, and giving sketches to the more ornate parts, as “stone and labour in chamfered jambs,” “ditto in moulded ditto,” &c. The method adopted by the author is to measure net the cubical block of stone, and take all the labours upon it separately, which is known as the “London system.” Full directions are given for measuring. Thus the net size of block is measured, any fraction of an inch being called another inch. Add to the price of stone the labour of hoisting, setting, and scaffolding per foot cube, and so describe. State how finished—whether tooled, chiselled, rubbed, dragged, combed, &c. Stone hoisted 40ft. is kept separate, and also in heights of 20ft. above same, as 40ft. to 60ft., 60ft. to 80ft., &c. All stonework up to 3in. in thickness is taken by the foot super., and all labours described. Any stone above 6ft. in length is cubed, called “scantling.” Beds and joints per foot super. are described as “one face measured for two.” “It is usual to take a bed and a joint to each stone which will be equal to half-bed or joint on four out of the six surfaces of the block, that is, the top, bottom and two sides. Sometimes beds and joints and preparatory faces are omitted, and the stone described as including all plain beds and joints, &c. When this course is adopted, every other labour is measured as it finishes,” &c. Many other useful rules are given of use to the estimator: thus, the labour to back of stone is described as “half-sawn” or drafted and measured by the foot super. Examples of taking out quantities of stonework are given for a main cornice and balustrade, with abstract of same, and the bill priced, also for a doorway and a column. These practical examples of bills of quantities will be found of service by the

student and mason, and add much to the value of this edition. In the section on Building Stones the author gives some useful advice about the importance of a mason having a knowledge of the structure of rocks, and the situations where the best material is obtained, the composition of stones, &c. Many suggestions are given for testing. The author refers to the report of the Royal Commission appointed in 1838 to report and advise on the most suitable stone for the Houses of Parliament; but the result of the selection, as we know, has proved unsatisfactory. The remarks on “Weathering,” “Seasoning,” “Appearance,” “Porosity and Absorption,” “Natural Bed,” “Facility of Working,” “Compactness and Weight,” &c., are worth reading, and a list of the principal quarries of Great Britain where stone is obtained are useful; these refer to sandstones and limestones.

AN OLD GERMAN TABLE AND CHAIR.

THESE two charming pieces of old furniture are thoroughly Gothic in their construction and design, and yet at the same time well accord with comfortable use, for which they were intended, which is more than can be said of much of the modern Medieval furniture produced during the time of the Gothic Revival. These pieces contrast favourably also with a good deal which passes as original under the contemporary influence of the Arts and Crafts movement. The pieces are strong without being lumpy and ungainly, while at the same time elegance has been obtained without weak and thin long drawn out lines. Mr. William Flockhart has enabled us to illustrate these examples.

A sub-committee of the Wakefield City Council, authorised to obtain a site for a hospital for infectious diseases, has approved of one of 14 acres 2 rods 5½ poles of land, situate on the north side of Batley-road, Alverthorpe, which has been offered them on behalf of the Countess of Cardigan for £2,000.

A joint meeting of the estate and property committee and sanitary committee of the Newcastle-on-Tyne Corporation has been held to discuss the type of houses to be erected on the Walker Estate for artisans’ dwellings. It was considered advisable to erect several blocks of self-contained houses of four rooms, with a bathroom.

BOOKS RECEIVED.

How to Measure-up Woodwork for Buildings. By OWEN B. MAGINNIS, architect, Inspector of Buildings City of New York, &c. Illustrated. (New York: The F. J. Publication Company.)—This is a small handy volume, "describing the simplest method to be followed when figuring up the woodwork required for either brick or frame houses." The methods differ a little from our English plan of measuring joinery, and the details of window-frames for brick walls are not quite as we dopt. Various details of vertical and horizontal sections of window and door frames are illustrated for brick, stone, and framed walls. The author says brick frames are usually measured both in height and width by the height and width of brick opening. For framed or wood walls the dimensions are taken from sill to head, two cross studs, top and bottom, and an inch allowed for clearance between the studs. The width is taken between the studs, and 2½ in. is added for a sash-weight box to permit them to run up and down freely. Door jambs, casings or "trims," or architraves, skirtings, window "trims," wainscot panelling, doors of various kinds and house fixtures, dressers and cupboards, &c., are all illustrated by examples; the method shown of panelling for doors are not those we can approve, but are certainly American. Measuring-up stairs, balusters, and handrails, is another chapter. Many useful suggestions are given for measuring up rough timber and floors. Taking a square of flooring, a certain number of boards go to every square, from which the lineal feet of a given width can be got. Thus—if 6 in. boards are required, we find there are 10sq.ft. in two boards 10ft. long placed together, or 10sq.ft. in one board 20ft. long. Then, if one board makes 10sq.ft., how many will make 100sq.ft.? Multiply $10 \times 10 = 100$, which multiplied by 8½ = 833½, which will be accurate enough for all practical purposes. The last chapter contains useful data as to nails required, weight of lumber, windows and doors, shingles, &c. This book ought to be of much use to all builders, carpenters, and others. Its price is 20 cents.—The seventh edition of *A Digest of the Law of Easements*, by L. C. INNES (London: Stevens and Sons, Ltd. 7s. 6d.) embraces several important cases which have come before the Courts since January 1900, and is thus brought well up to date. It is hardly necessary to add that the care exercised in the computation of this excellent textbook renders it invaluable.

The Grand Duke Michael of Russia will unveil at Newcastle-under-Lyme, on Thursday next, a bronze statue, on a granite base, of Queen Victoria. The statue, which will occupy a conspicuous position in Nelson-square, has been given by Sir Alfred Seale Haslam, M.P., in commemoration of the Coronation, and is a replica of the one on the Thames Embankment at the corner of Blackfriars Bridge, given by Sir Alfred on the occasion of the late Queen's Jubilee.

In the case of the application on behalf of Albert Edward Lewer, Southwick, late Hove, both Sussex, builder and contractor, the order of discharge has been suspended for two years, ending Aug. 7, 1905.

The Local Government Board has sanctioned a loan of £14,117 to the Cheltenham Corporation for the purposes of wood paving in the principal streets along the route of the proposed extension.

The city council of Exeter have granted a site opposite the entrance to Bury Meadow, on which will be erected the equestrian statue of Sir Redvers Buller.

The new women's hospital which is being erected in Cannought-road, Wolverhampton, is to be opened in January next. The site, which is close to the West Park, has been presented by Mr. J. L. Gibbons, of Ellowes Hall, Sedgley, and the cost of the structure will amount to about £12,000. We illustrated the building, of which Mr. A. Elton Painter, of Wolverhampton, is the architect, in our issue of April 17 last.

The Board of Agriculture notify that the publication of the revised Ordnance Survey maps, on the scale of 2½ in. to one mile, is in progress for the County of Suffolk, and is proceeding from south to north.

At Lishbellaw, County Fermanagh, a co-operative creamery has been erected adjoining the Great Northern Railway. Mr. James Harvey, Enniskillen, was the contractor.

The Local Government Board have sanctioned the sewerage scheme promoted by the Bury St. Edmunds Town Council, and they have also sanctioned a loan of about £3,000 to carry out the work.

OBITUARY.

Mr. J. THORNBURN ROSS, a well-known Scotch artist, and an Associate of the Royal Scottish Academy, died on Monday in the Edinburgh Infirmary from injuries believed to have been sustained through a fall down a flight of stairs in his studio. He was a son of the late Mr. R. T. Ross, R.S.A., Edinburgh. Among his leading works were "A Garland of Poppies," exhibited in 1889; "The Girl I Left Behind Me," in 1890; "Where Do the Fairies Dwell?" in 1891; "Serato Veneziana," in 1892; "A Daughter of the Soil" and "The Poppy Field," in 1894; "The Beau of the Hiring Fair," exhibited in 1900; and a view of the Bass Rock, with sea-fowl, shown in 1901. Mr. Ross was elected an A.R.S.A. in 1896.

Mr. JOHN GREENWOOD, builder and contractor, of Arthur-street West, and a much-respected member of the City Corporation, died on Saturday last, aged 65 years. Mr. Greenwood entered the Court of Common Council as a member of the ward of Candlewick in 1885, and in 1894 became Deputy Alderman of the ward. A year ago, on the resignation of Sir John Moore, he was a candidate for the vacant gown; but, after a friendly contest, was defeated by Mr. Alderman Burnett, who reappointed him as deputy. He was a leading member of the Masons' Company.

Mr. WALTER DICKSON, one of the best-known architects in New York State, died in Brooklyn last week at the age of 68. Mr. Dickson was for many years established in Albany, N.Y., where he executed many important commissions, and gained the highest esteem of the profession and the public. He was the architect of the Albany Post-office and of the Albany City Prison, among other public buildings. He removed to Brooklyn some fifteen years ago, and formed a partnership with Mr. Withers. The firm of Withers and Dickson carried out much important work, and prepared the selected designs for the Tomb of the Prison, but the execution of the work was intrusted by the authorities to others.

CHIPS.

The new tramcar shed that has been erected in Hylton-road, Sunderland, for the Sunderland Corporation was formally opened on Wednesday by the chairman of the tramways committee. The car shed is 346ft. long by 62ft. 6in. wide, and the height to the trolley wire is 21ft., while the height to the apex of the roof is 36ft. The fitting shop, which is a continuation of the car shed, is 40ft. long, and the total area of the site is 5,430sq. yds.

At the town-hall, Birkenhead, on Tuesday, Col. W. Langton Coke, M.I.C.E., held an inquiry on behalf of the Local Government Board, concerning the application made by the Birkenhead Corporation for sanction to borrow £4,007 for the purchase of a site for public baths at the south end of the borough. The site is on the side of Old Chester-road and in the rear of Alexandra-terrace, Bedford-road, Rock Ferry.

On Wednesday afternoon, at Blaydon, the foundation-stones were laid of a new Catholic Church and Presbytery, to be erected at a cost of between £8,000 and £9,000.

On Tuesday, Mr. W. A. Ducat, Local Government Board inspector, held an inquiry in the Stothard Memorial Hall, Monkton, into the application of the South Shields Rural District Council to borrow £900 for the purposes of sewerage works in Monkton village.

The annual meeting of the East Riding Anti-quarian Society took place at York, on Monday and Tuesday. The members spent the second day in a round of visits to the churches of the city to see the ancient stained-glass which they contain. The party, who were under the guidance of Mr. J. R. Boyle, F.S.A., of Hull, visited some eight churches.

A window to the memory of the late Mr. W. E. Geach, was dedicated by the Lord Bishop of Truro at the parish church, Tywardreath on Monday. The window, which was designed and erected by Messrs. Fouracre and Son, of Stonehouse, is placed in the tower, which contains the chimes, the last present of the deceased to the church. The window contains three lights, and represents "Our Lord." The central figure is the "Good Shepherd," the right-hand one "I am the way: follow Me," the other light "I am the bread of life." The upper part of the window is filled with four angels bearing shields symbolic of the four Evangelists.

The Isle of Walney Estates Company have received an order for eight million bricks for Admiralty forts to be erected on the west side of Walney Island. The order is regarded as the first step towards the erection of forts to protect Vickers' shipyard and the town generally.

Engineering Notes.

ELECTRIC TRACTION ON THE NORTH-EASTERN RAILWAY.—The North-Eastern Railway Company have completed a portion of the first section of the local lines which it proposes to equip electrically, and had trial runs on Sunday. The line is part of that between Newcastle and Tynemouth, the distance being three miles. It is on the third-rail system, the power being supplied by the Tyneside Power Company from a station at Wallsend. Two motor-cars are used with a trailer between; each motor is of 125H.P., the energy being taken from the third rail by a shoe brushing over it. The cars obtained a maximum speed of 45 miles an hour. The multiple unit system is used.

Mr. Aston Webb, R.A., P.R.I.B.A., has been elected *Membre Correspondant* of the Société Centrale des Architectes Français.

At a meeting of the archdeacons and rural dean of the diocese of Bath and Wells held to appoint diocesan surveyors, in accordance with the provisions of the Ecclesiastical Dilapidations Act, 1871, for the ensuing five years, the following were duly elected:—Mr. C. R. Wainwright, of Shepton Mallet; Mr. E. M. Hippisley, of Wells; and Mr. A. H. Cottam, of Bridgwater. Messrs. Wainwright and Hippisley have held the office for many years, and Mr. Cottam succeeds Mr. Samson, who has resigned the office after holding it for twenty years.

The new Wesleyan Central Hall in Corporation street, Birmingham, which has been built as a 20th century memorial, was opened on Wednesday week. The hall, which has been erected opposite the Victoria Law Courts, is in the Renaissance style and has cost £65,000. From the centre rises a turret 180ft. high, and on the ground floor and basement are shops and warehouses. The great hall will seat 2,000 persons, and the Synod hall will accommodate 450. There are also rooms for Sunday-school, library, gymnasium, and girls' and men's clubs.

The new grand staircase and isolation wards at sundry other alterations, which necessitated the closing of Charing Cross Hospital on June 18 last, having been completed, the hospital will be reopened for in-patients and out-patients on Monday next. Mr. A. Saxon Snell, F.R.I.B.A., is the architect for the extensions, which have been carried out at a cost of about £90,000 by Messrs. Hollow Brothers.

Wm. Goldie, one of the leading builders in Chicago, died on Sept. 7 in that city. Although 78 years of age, he took an active interest in so large contracts his firm was carrying out for a Louisiana Purchase Exposition, as in previous years for the expositions at Buffalo and Omaha.

The new Royal Victoria Hospital at Belfast, built at a cost of £100,000, and formally declared open by the King during his Majesty's recent visit, was on Friday for the first time occupied by the patients from the old Royal Hospital in Frederick-street.

Of the £20,000 required for the development of the properties acquired at Bethesda by the New Wales Quarries Ltd., over £18,000 has now been subscribed. More than half of the shares are held by co-operative societies. The slate being produced has been pronounced by experts to be of excellent quality, and the demand is far in excess of the production. Only one of the quarries is at present being worked, but it is hoped that before long operations will be begun at the other properties.

Two extensions of the electric tramway route were opened at Newcastle-on-Tyne on Saturday. One ends at Adelaide-terrace, Benwell, the other from the Stack Hotel, Low Walker, to Walker Railway Station.

The tender of the Columbian Fireproofing Co. Ltd., 37, King William-street, E.C., has been accepted for the steelwork, fireproof floors, galleys, and landings required for Chilworth Manor, Hants, for which the architects are Messrs. Colson, Farrer, and Nisbett, 29, New Bridge-street, E.C., are now fast proceeding with the work for the large mansion house of Hursley Park, Winchester, for which in short time ago they obtained the contract for the constructional steelwork and fireproof construction, the architect of this work being Mr. A. Marshall Mackenzie, A.R.S.A., 343, Union-street, Aberdeen.

The Highworth Rural District Council have resolved to further consult Messrs. Beesley, and Nichols, of Westminster, in connection with the sewerage and sewage disposal of Rodbourne Chert.

At the last meeting of the corporation of Ipswich Mr. Frederick Bennett, builder, of Fore-street, Clement's, and a councillor for St. Clement's Ward, was unanimously elected as alderman, in succession to the late Mr. Alfred Wriuch, wholesale ironmonger.

Building Intelligence.

DUNDEE.—The authorities of University College are at present considering a scheme for the improvement of the college on an extensive scale, and an appeal is being made for assistance to permit of the undertaking being carried through. The present buildings consist of a row of detached villas, facing the Nethergate, and joined together by a corridor running from end to end. These, it is proposed, should be replaced by a building which will stretch over the present frontage, but erected further forward, and there will be contained in it the departments of zoology, botany, geology, mathematics, law, and the subjects of the arts curriculum. Sir Rowand Anderson, Edinburgh, who has been consulted, estimates the cost of the undertaking at £80,000; but it is suggested that the work might be taken up in sections. The funds in hand have been greatly depleted, and there is now only £8,000 available. To erect the first section of the buildings it is calculated £18,000 would be needed.

EDINBURGH.—During the summer vacation the four higher-class schools belonging to the Merchant Company, which were reopened on Tuesday, have been put into a state of good repair, the painting of the buildings this year having been done on a much more extensive scale than formerly. An important addition has been made to George Watson's Ladies' College. A new wing has been added to the east side. In the basement floor there is a cookery lecture-room, besides a luncheon-room, with a suite of lavatories in the rear. On the first floor is the classroom for physical science. The chemical laboratory occupies the second floor, and the top room is set apart for the teaching of art. These classrooms measure each about 45ft. by 3ft. Steps are being taken with the view of carrying out the scheme, whereby new buildings will be erected for James Gillespie's School, to be temporarily occupied by the pupils of the Edinburgh Ladies' College during the proposed entire reconstruction of that institution. In the mean time Mr. G. Washington Browne, R.S.A., engaged in the preparation of plans for the consideration of the Governors of the contemplated new buildings at Gillespie-crescent.

GATESHEAD.—The new church of St. Chad, in Westminster-street, was consecrated by the Bishop of Durham on Tuesday. The building has been erected from the plans of the late Mr. W. S. Hicks, of Messrs. Hicks and Charlewood, Newcastle; it has cost altogether £26,000, borne by Messrs. Easton. The lofty building, with its central octagonal tower and low eastern chapel projecting beyond the choir, resembles a miniature cathedral. The style of the building is, in its main, based on the Early Perpendicular. The principal entrance is by a porch on the north side of the church. Above the door of this porch are three niches holding statues representing St. Aidan, St. Aidan, and Theodore of Tarsus. Entering the church, a prominent feature is the font in Derbyshire alabaster, with its tall oak canopy. The font is surrounded by eight small statues. Above and behind the font is the west window with stained glass, which has been placed in memory of the architect, Mr. Hicks. Its six lights are divided by a central mullion into two sets of three lights each. The three southern lights illustrate the idea of the building of the material fabric, and the three northern the building of the spiritual fabric. The pulpit, in carved oak, has four panels in relief. The whole scheme of decoration in the sanctuary springs from a fresco painted by Mr. Eadie-Reid below the east window. The subject is "The Annunciation." Above the fresco is the seven-light east window, with three tiers of subjects representing the Nativity, the Crucifixion, and the Lord in Glory. The organ, built by Messrs. Abbott and Smith, has three manuals, and is placed in a chamber on the north side of the choir. The choir vestry and the clergy vestry south are connected by an ambulatory aisle behind the high altar. This ambulatory gives access to the chapel, dedicated to All Saints, which is to be used for the daily services. Messrs. Hicks and Charlewood, Newcastle, are the architects; the contractor, Mr. Isaac Hewley, Dunston; clerk of works, Mr. F. Caldecleugh, Durham; the woodcarving executed by Mr. Ralph Hedley, Newcastle; metalcarving, font, &c., Mr. Beall, Newcastle; stained glass, Messrs. Taylor, Loughborough; stained glass, Messrs. Percy Bacon and Brothers, London;

frescoes, painted panels, and designs for carved figure panels, Mr. J. Eadie-Reid.

HIGHGATE, N.W.—Dedication services were held at St. Michael's Church, Highgate, on Tuesday. The decorations at the east end of the chancel, which have been executed at a cost of about £500, from the designs of Mr. Temple Moore, of Hampstead, were seen for the first time. Four statues of early fathers of the church (Athanasius, John Chrysostom, Augustine, and Jerome) have been placed in the niches by the side of the beautiful large stained-glass window, and the walls have been decorated in a Late Gothic style in keeping with the architecture of the chancel, which was built from the designs of the late Mr. E. Street, R.A. Below the niches is a new stone cornice to the reredos, richly carved in vine-leaf pattern. The figures are also in stone, and these and the cornice, together with the window jambs and tracery, have been painted and gilded, and the walls have been diapered in colour. The reredos has been coloured and a new retable has been added to it. On each side of the reredos the walls have been supplied with hangings.

HOLT, NORFOLK.—Field-Marshal Sir Evelyn Wood, V.C., formally opened on Wednesday the new school buildings at Gresham's School, Holt, Norfolk. The school was founded by Sir John Gresham in 1554, and its management was vested by the founder in the Fishmongers' Company. The governors have now reorganised and rebuilt the school. The new premises, which were begun two years ago, are situated upon the north side of the Cromer-road. Built in separate and detached blocks in the Domestic Renaissance style, with the exception of the school-hall, which is in Late Gothic, the building to the west contains the master's house, dining-hall, boys' studies and dormitories, kitchens, and offices; the eastern block contains the school buildings, assembly-hall, laboratories, and workshops; and the boys' dining-hall is situated in the centre of the first block. The school building proper contains the assembly-hall, which is 70ft. by 32ft., with tracery windows and open-timber roof. From the hall a wide corridor extends westwards, with classrooms and cloakroom on the north side, ending in a return wing containing the laboratories, workshops, and lecture-rooms. Electric light is supplied from a generating station specially erected in the grounds. Mr. Howard Chatfield Clarke, of Bishopsgate-street Within, E.C., is the architect of the school, which was illustrated by a double-page perspective and four plans in our issue of August 15, 1902. The builder is Mr. Geo. Riches, of Church-street, Cromer.

HUNSLLET, LEEDS.—The new workhouse and infirmary at Rothwell Haigh, which had been built by the guardians of the Hunslet Union, at a total cost of £85,850, were opened yesterday (Thursday). The new workhouse and infirmary occupy a site of eighteen and a half acres near the junction of Wood-lane and Wakefield-road at Rothwell Haigh, space being allowed for future extensions. At present accommodation is provided for 450 inmates, so that the cost works out at £182 per inmate. The establishment consists of six groups. The entrance building contains porters' rooms, receiving and vagrant wards on the cellular system, and also rooms for storing clothing. The workhouse proper has the administrative block in the centre, with the committee-room, business offices, and master's house in front, and dining-hall, kitchen, workrooms, matron's office, bakery stores, &c., in the rear. Connected by glazed conservatory corridors with the main block are pavilions for the male and female aged and able-bodied classes, with the necessary dayrooms, officers' rooms, bathrooms, &c. The laundry and boiler-house are situated between the main building and the infirmary.

LIVERPOOL CATHEDRAL.—A special meeting of the Liverpool Cathedral Committee was held on Monday, Mr. Robert Gladstone presiding. There were also present the Earl of Derby, the Lord Bishop, Mr. G. F. Bodley, R.A., and Mr. G. G. Scott (architects), Mr. George Bradbury (surveyor), and Mr. J. Alderson Smith (secretary). Samples of various stones were submitted, and it was resolved, after careful consideration, to employ the local red sandstones in the erection of the cathedral. The architects also submitted plans of details, and it is expected that the arrangements will be made for laying the foundations early in the new year.

PETERBOROUGH.—New premises for the school of art have been built on a site in the Broadway,

originally purchased by the city council for a cattle market, but not hitherto utilised. The plans have been prepared by Mr. John W. Walslaw, the city surveyor, and the cost has been about £4,000. The building has a frontage of 80ft. to the proposed corner of Geneva-street, and a depth of 110ft. The main doorway leads from the Broadway, and the entrance-hall the staircase leads to the upper floors. The first three rooms on the ground floor, with a frontage to the new street, are 21ft. wide. Beyond comes the lecture-room, 21ft. by 24ft., with a gallery to seat 80 students. The last is the mechanics' room, 24ft. by 18ft. 6in., fitted with the engine, shafting, lathes, and so forth taken from the old school. The upper floor consists of a library, 11ft. by 22ft., a master's room, two advanced art-rooms, 15ft. by 20ft., cloak-rooms, and so forth. The contractor was Mr. J. Lucas.

PUDSEY.—The technical school in connection with the mechanics' institute has outgrown its accommodation, and the urban authority, therefore, purchased and altered a two-storied building in Robin-lane. Formerly a wool-store house, this building has been adapted to its new purposes. There are two classrooms on the ground floor, each 22ft. by 11ft. Another room on the same floor, 33ft. by 19ft., will be utilised as a textile department. On the upper floor is a large lecture-room, capable of being divided into two apartments, which are to be used as engineering and building construction departments. Other branches will find accommodation in two other classrooms on the same floor. The alterations have been designed by, and carried out under the supervision of, Mr. Herbert Hodgson, of Leeds and Bradford.

SHEFFIELD.—The new premises recently erected at Westville for Mr. J. G. Graves were formally opened on Friday. The site extends from the Durham-road to Western-bank. The buildings comprise two blocks connected by corridors on each floor running north and south, flanked outside by a garden and courtyard. The south block has four floors, the three upper ones being devoted to offices, the basement being occupied as offices, stationery stores, and heating chambers. Block No. 2 contains five floors, the basement being used principally for stores, strong rooms, &c., and the first, second, and third floors for offices. On the top floor is a recreation room, 77ft. 6in. long and 49ft. 6in. wide, adjoining which are kitchens, scullery, pantry, larders, still-room, stores, reading-rooms, bathrooms, and lavatories. The staircases are of stone, with walls of light-coloured glazed bricks. The sash windows are fitted with National Accident Prevention casements. The buildings are faced externally with the best red bricks from Dennis's, of Ruabon (who also supplied the glazed bricks used in the interior), and ashlar stone from the Stoke Hall quarries. The floors throughout are of cement concrete and steel joists, the surface being laid with maple wood blocks. The buildings are roofed with green Westmoreland slates, and the staircases are of Greenmoor stone. The buildings are heated throughout on the low-pressure hot-water system. Large extraction shafts are provided from basement to roof to carry off the vitiated air with a Boyle's air-pump fixed at the top. The buildings have been designed by and carried out under the superintendence of Messrs. Holmes and Watson, architects and surveyors, and have been erected by Messrs. George Longden and Sons, contractors, all of Sheffield, Mr. J. Brooks acting as clerk of the works.

SOUTHAMPTON.—The memorial stones of St. Barnabas' Church, at the corner of Lodge, and Rose-roads, were laid last week. The church is Late Gothic in style, and is of very simple plan, it being a parallelogram divided into three parts by two arcades. Its length is 115ft., and width 51ft. in the clear of the walls. There is no chancel arch, but the nave arcade is continued one bay beyond the dwarf stone wall dividing the chancel from the nave, the sanctuary extending some 12ft. farther east. The church contains seating accommodation for 600 worshippers, and a choir for about 30, with organ chamber, small morning chapel, and vestry, and in the basement there is a heating chamber. The roofs are open and boarded, and the walls are plastered, with stone dressings. The exterior of the church is faced with coursed Swanage rubble, without the usual dressings to quoins, &c., in soft stone, and the roofs are to be tiled with a dark colour red tile. Messrs. Jenkins are the

builders, and the architects are Messrs. W. H. Mitchell, Son, and Gutteridge, of Portland-street, Southampton.

THORNHILL, SUNDERLAND.—A new church and schools which have been erected in Burn Park-road, Sunderland, by the United Methodists, were opened on Wednesday. The buildings are in the Perpendicular style. The facings are of Pateley Bridge rock-faced blockers, with Blaxter stone dressings, all the window openings being heavily mullioned and traceried. At the corner a tower with a copper spire and vane rises 83ft. The church consists of a nave, clerestory, aisles, transeps, and chancel, and an end gallery over the entrance porches. Its seating capacity is for 520 adults. The nave arcades are worked in Denwick freestone. The pulpit base is in the same material, the upper part being of Austrian oak. The chancel is raised three steps above the nave level, and has an Austrian oak reredos screen. The choir seat ends and front screens are of the same material. The organ console will be placed in the centre of the chancel, the organ itself being divided, one half at each side. The roof is of pitch-pine, open-timbered, with chamfered hammer-beam couples. The seats, screens, and gallery front are also in pitch-pine. A stained-glass memorial window, with the "Ascension" as subject, has been placed in the chancel, and one of the transept windows is also of stained glass, representing St. John, St. Peter, and St. Luke. These windows have been designed and executed by Messrs. Atkinson Bros., Newcastle-on-Tyne. The school, which is recessed from the main road by two front classrooms, has accommodation for 300. The buildings, which have cost about £7,600, have been designed by, and the work carried out under the supervision of, Mr. J. Ezra Miller, F.S.I., and Messrs. Wm. and T. R. Milburn, joint architects, the contractor being Mr. W. B. Cooper, and the clerk of works Mr. R. F. J. Carter.

WAVERTREE, LIVERPOOL.—At the Municipal Offices, Dale-street, Liverpool, a Local Government Board inquiry has been held by Mr. A. G. Mallet into the application of the Liverpool Corporation for sanction to borrow £26,000 for the erection of public baths on land in Picton-road and Glynn-street, Wavertree. Mr. W. R. Court, the engineer and chief bath superintendent to the corporation, exhibited his plans, explaining that the buildings were to be of a substantial character, and would contain a men's swimming-bath 75ft. by 35ft., a women's swimming-bath 50ft. by 27ft., and private baths.

WOLVERHAMPTON.—On Thursday in last week the new workhouse erected at New Cross, Wolverhampton, was opened by the chairman of the board of guardians. The site occupies about fifty acres of land. The contract for the buildings amounted to £156,870, and this is exclusive of the cost of furniture, roadmaking, and boundary walls, nor does it include professional fees. The site occupied by the buildings is about six acres, and provision is made for 1,246 inmates, 20 nurses, and 60 other officers—a total of 1,326. The buildings are fitted up with maple wood floor blocks, mosaic tiled corridors, Doulton fireplaces, and electrical appliances in every room. Mr. Arthur Marshall, of Nottingham, whose design was selected in competition, is the architect, and the contractors were Messrs. T. Fish and Sons. The building was illustrated by a double-page perspective in our issue of Dec. 8, 1902.

Mr. William Moberley died on Friday at his residence, Hill View House, Woodsetton, Coseley, after a few days' illness. The deceased, who was a well-known brick manufacturer, with extensive works near Wolverhampton, had been a member of the Coseley Urban District Council since its formation, and for several years previously was a member of the old local board. He leaves a widow and family.

A Gill memorial wing has been added to the cottage hospital at Tavistock. The addition provides ten extra beds—making twenty-five beds in all—besides a laundry, drying chamber, and nurses' quarters. Mr. H. J. Snell, of Plymouth, was the architect, and Mr. John Kelly, of Horrabridge, the builder.

At Tamworth Church on Thursday afternoon the Bishop of Lichfield dedicated a stained-glass window in St. George's Chapel to the memory of the late Rev. Brooke Lambert, M.A., of Greenwich, and vicar of Tamworth from 1872 to 1878. The window contains four figures, representing St. George, St. Nicholas, St. Lambert, and St. Martin.

PROFESSIONAL AND TRADE SOCIETIES.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—On Saturday last the members of this society made an excursion to Dartmouth to visit the new Naval College buildings now in course of erection. The President (Mr. A. S. Parker, A.R.I.B.A., of Plymouth) entertained the party to luncheon, those present being Mr. Aston Webb, R.A., president of the Royal Institute of British Architects; Messrs. Charles Cole, vice-president; James Crocker, Exeter; E. Coath Adams, C. King, T. K. Kittell, B. P. Shires, Plymouth; O. Ralling, J. A. Lucas, C. J. Tait, S. Dobell, J. H. Shearer, Harbottle Reed, hon. secretary, Exeter; Otho B. Peter, Llanneaston; N. G. Bridgman, Paignton; W. H. May, A. E. Lethbridge, R. A. Mill, H. Watts, S. R. Griffin, W. W. Hitchens, H. R. Shires, A. N. Tucker, Plymouth; A. J. Adams, C. H. Varcoe, Devonport; C. Cole, W. J. Halls, and P. S. Shrimpton, Exeter; and A. Y. Rooke and G. P. Saul, Plymouth. In addition to the above members there were present the contractor for the new College buildings, Mr. Hill, of the firm of Higgs and Hill, London; Mr. Wallis, clerk of the works; Mr. Hill, Admiralty clerk of the works; and Mr. Cousens. Under the guidance of Mr. Aston Webb, the new Naval College was then inspected. From a large plan Mr. Webb described the general scheme and the purposes to which the various sections were appropriated. The main buildings, to cost upwards of £400,000, were generally at the roof level, and one of the wing towers is erected, but the central portion, which includes a dominating tower, is not up to its full height. Wide-jointed red brick, with Portland stone dressings, gives a warmth to the composition, the main façade being about 700ft. long. The accommodation is for about 300 cadets, with quarters for officers and staff, and a residence for the captain.

LIVERPOOL ARCHITECTURAL SOCIETY.—This society will inaugurate on Monday next its 56th session, when, in the rooms in Harrington-street, the President, Mr. John Woolfall, F.R.I.B.A., will deliver his opening address. During the term several papers of important bearing are to be read, and it should be marked that at the meeting of March 7 Mr. G. Gilbert Scott is to read a series of "Notes on the Liverpool Cathedral"—notes which will be accompanied by sketches and drawings.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Arrangements have been made for the following papers to be read at the ordinary meetings of the Institute next session:—Nov. 16, "Le Trésor de Cnide et les Monuments de l'Art Ionien à Delphes," by Monsieur J. T. Homolle; Dec. 14, "The Royal Victoria Hospital, Belfast; Its Inception, Design, and Construction," by Messrs. Wm. Henman and Henry Lea, C.E.; Jan. 18, 1904, "Architecture in Lead," by Mr. J. Starkie Gardner; Feb. 15, "The Bacteriological Disposal of Sewage from Isolated Buildings," by Professor Frank Clowes, D.S.C.; March 14, "Plaster Decoration," by Mr. J. D. Crace; March 28, "Electric Generating Stations," by Mr. C. Stanley Peach; April 18, "The Statues of Wells Front, with some Contemporary Foreign Examples of Sculpture," by Mr. E. S. Prior; May 16, "The Planning of Collegiate Buildings," by the Rev. J. B. Lock, M.A., Bursar of Gonville and Caius Coll., Camb.

THE SANITARY INSTITUTE.—A provincial sessional meeting of the Sanitary Institute was held at the University, Birmingham, on Saturday. About 150 members attended from London, Ireland, and various provincial centres. Dr. Alfred Hill presided, and dealing with the subject set down for discussion, the treatment of sewage, spoke of the progress made in that department of sanitary science during the past thirty years. Professor Bostock Hill, of Birmingham, read a paper in which he pointed out that in the two modern methods of sewage disposal—land treatment and bacterial purification—the underlying principles were the same. Bacterial systems had arisen through a proper understanding of nature's methods in dealing with waste matters in the soil. Good results were only possible in land treatment when land suitable in quality and ample in quality could be obtained. An important advance had been made by the utilisation of bacteriological methods in connection with land treatment instead of utilising precipitation, as was formerly done. The selection of a system depended upon the particular

circumstances in each case. Success at one place was no guarantee of success in others. Mr. J. Edward Wilcox, M.I.C.E., of Birmingham, contributed a paper in which also stress was laid upon the impossibility of successfully treating all kinds of sewage by similar methods. Dr. Rideal (London), Dr. Fosbrooke (Worcester), and Messrs. Lowcock (Malvern), Scott-Moncrieff (London), and A. J. Martin (London) also took part in the discussion. Visits were paid by those in attendance at the conference to a new crematorium at Perry Bar, and to the works of the Birmingham, Tame, and Rea District Drainage Board at Tyburn.

CHIPS.

An organ, built by Messrs. Hele and Co. of Plymouth, was dedicated at Chirk Parish Church on Thursday in last week.

The Ipswich Town Council have just completed the purchase for £6,577 of a large portion of the late Mrs. Byles's estate in St. Helen's. It is well wooded and hilly, has an area of about 11 acres, and will form an additional open space, to be known as Alexandra Park. A further sum of £1,422 will be expended in widening the various streets that abut on the park and estate, the remainder of which is being laid out for building.

An organ, built by Messrs. Norman and Beard of Norwich and London, was opened on Friday at St. Columba's Presbyterian Church, Smithdown-gate, Liverpool.

The death is announced of Mr. Arthur Jot Barlow, architect, of 48, Edward-square, Kensington. The deceased was elected an Associate of the R.I.B.A. in 1880.

Plans for the reconstruction of the Gaiety Theatre, Ayr, which was partially destroyed by fire, were passed by Ayr Dean of Guild Court on Friday. The plans show some improvement on the interior of the building.

The Bishop of Lincoln on Saturday afternoon opened a new church at Gosberton Chough, near Spalding. The building, which has been erected at a cost of £1,300, will accommodate 120 worshippers and is from designs by Messrs. W. Bucknell and J. N. Comper, of Westminster. The church has been given the name of SS. Gilbert and Hugh.

The tablet to the memory of Mr. F. C. Penrose F.R.S., the erudite surveyor of St. Paul's, is now in course of preparation, and it will be shortly fixed in the crypt of St. Paul's Cathedral.

As a memorial to the Rev. J. Fowler Tanner, for twenty-four years the rector of Chawleigh, a new pulpit has been placed in the church. This has now been erected by Mr. Harry Hems, of Exeter, and is of oak, hexagonal in shape, carved and designed to correspond with the old oak screen. The dedication service was conducted on Thursday evening in last week by the Bishop of Exeter.

The foundation-stone of St. Margaret's Hall, which is to be erected at Castletown, near Sunderland, as a memorial to the late Col. C. J. Biggs, was laid on Saturday. The hall will be 60ft. by 27ft. and will seat 500 persons. The cost will be £1,300. Messrs. Henderson and Hall are the architects.

The gas and electric-lighting committee of the Aberdeen Town Council have appointed Mr. Samuel Milne, assistant gas engineer, as gas manager, in room of Mr. Smith, who has retired, at a commencing salary of £350, with yearly increases of £25 until it reaches £500.

Sir George Newnes, Bart., M.P., has offered to erect, on a prominent site in the Valley of Rocks road, a Congregational church, furnish it, and complete the gift with an organ. The site purchased by Sir George is practically given, he accepting only a nominal sum.

A quarter of a century has passed since the Arch-bishop of York, then vicar of Kennington, S.E. was raised to the Episcopal Bench as Bishop of Lichfield. As a thank-offering his Grace has erected a western tower to the new church of St. Andrew, Bishopthorpe, the parish in which the palace is situated. The dedication service took place on Tuesday, and at the same time there were dedicated three stained-glass windows, which have been placed in the church as memorials of the late vicar Canon Keble, and a peal of bells. The new church was built four years ago from the designs of Mr. C. Hodgson Fowler, F.S.A., of Durham. The tower which has now been added has cost £1,600. It is 64ft. in height, and is crowned by a battlemented parapet. The west window is of three lights with foliated tracery, and in the belfry are four bells. The builders were Messrs. E. Bownd and Sons, of Stamford and Hull.

Mr. J. Fletcher Moulton, K.C., M.P., has been elected president of the Junior Institution of Engineers, in succession to Colonel Edward Rabel C.B., R.E.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsgent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—M. C. R.—K. L.—J. N. L.—O. F. and Co.—G. C. M.—W. A. F.—N. F. L.—F. W. and Co.

"BUILDING NEWS" DESIGNING CLUB.

S. J. WEARING. (The slight discrepancy amounts to "Solo" being twice first and three times second instead of once first and four times second, while "All British" was four times first and twice second instead of five times first and once second. The difference does not alter the award.)—W. KING. (If the school plan works out too large for the sheet at eighth scale use sixteenth of an inch scale for the plans, keeping to the larger scale for the elevations and sections. A porter's or secretary's office is not wanted.)—J. PERKINS. (The preparation room is for lecturers to make ready in. The balance room is for the instruments and appliances to be kept in. Blocked-in walls means walls washed in solid. No description other than what is put on the drawing is required.)

Intercommunication.

QUESTIONS.

[12359].—Model Farm.—Can any of your readers inform me, through the medium of your paper, of the whereabouts of a model farm homestead of about 200 acres, erected recently within 50 miles of London?—L. M.

REPLIES.

[12007].—Electrical.—"Bell Fitting," by F. C. Allsop, 1902; "Internal Wiring," by H. M. Leat, 1899;

"Electric Lamps and Lighting," by J. A. Fleming, 1899; ditto, by J. E. H. Gordon, 1884. Probably stocked by B. T. Batsford, of High Holborn, W.C.—REGENT'S PARK.

[12008].—Normandy.—The assumption that a pleasant as well as economical trip may be taken by a chance visitor to the Channel Isles in the adjacent coast of Normandy is correct. The Jersey Eastern Railway Company have as a connection a French steamer, the *Cygne*, of some 60 tons, and capable of carrying about 250 passengers, plying daily between Gorey and Carteret. This route was opened about nine years ago, and deserves to be popular. The average sea passage is about an hour and a half, and Gorey is less than half an hour's ride by rail from St. Helier. There is a lovely bay at Gorey, standing boldly out into which, and perched upon a steep rock, is the Medieval castle known as the Chateau de Montorgueil. Its stern towers frown down upon the straggling street below, and for hundreds of years have bid a bold defiance to any possible invader from the opposite and by no means distant shore. The latter, north-east of Gorey, may be distinctly seen in fair weather. The time the steamer starts varies daily with the tide, and is given monthly in the local time-tables. It is as well to start from St. Helier by an earlier train than the boat one, as the Castle is well worth an hour's visit. Through return tickets are singularly moderate in cost. One may book any day from St. Helier to Carteret (Normandy) and back (available for a month) for 7s., second class rail and first class on steamer; whilst third class returns (for a like period), with liberty to stop over at any intervening station, are issued from Jersey's fair and lively little capital, to Cherbourg for 9s. 2d., and even as far as Caen for 12s. 1d., or should one prefer to remain at Cherbourg and return home from there direct to Southampton, a single through third (St. Helier to Cherbourg) only costs 6s. 3d. This ticket frees the traveller second class rail in Jersey (the island knows no "thirds") and second class on the steamer. It may be remarked that third class railway travelling in Normandy is rather crude. There are only wooden seats in the carriages, and no windows, save those over the doors. Thus, although by so doing one loses the charm of being in close touch with such local peasantry as may be travelling, it is, maybe, best to book second, these latter being exceedingly comfortable coaches. The cost second between St. Helier and Cherbourg is 8s. 6d. single, 12s. 10d. return, these tickets permitting first class travelling upon the Jersey railway as well as on the steamer. There are trains between Carteret and Cherbourg (three or four daily each way); the time taken averages three hours. Station-masters and all officials connected with the line are most polite; they scarcely glance at the tickets *en route*, and make no objection to the rambler staying so long as he wishes at any little station the immediate neighbourhood of which he may be desirous to explore. Saturday to Monday return tickets are issued between St. Helier and Carteret and *vice versa* (second class) for 5s. These facilities, given fine weather, offer a delightful little trip to those whose time is limited. There are two large hotels at Carteret and a small one. The latter I do not recommend. Of the former, the Hotel d'Angleterre is perhaps the best; it is charmingly situated, one front having verandahs and bedrooms overlooking the river, near to the spot where the latter's fresh water flows lazily into the sea. The catering is all that can be desired (6s. 6d. a day, *en pension*, inclusive of capital order at lunch and dinner). The handrail to some circular stone steps leading down from the main building to the courtyard in this hotel might be mistaken for rusticated woodwork. It is of cement, and a clever example of what may be done in this way in the latter material. The village is well sheltered from the winds by a headland to the north, known as Cape Carteret, and the sands cover a vast expanse; indeed, I never saw finer. Originally a mere fishing hamlet (long celebrated for its lobsters and turbot), numerous residential houses have recently been erected there. One of them is a sculptor's studio, wherein right clever work is being done by its owner, inspired, as he no doubt is, by the continual murmur of "the sad sea-waves," which perpetually wash the shore at the base of the cliff whereupon his atelier is built. The latter is a quaintly-conceived castellated, low, rambling stone building—just what an artist innocent of all architectural training might be expected to erect. Its exterior decoration takes the form of well-modelled sculpture in red terra-cotta; while nude maidens, rising from ocean foam, are cleverly painted in recessed panels. The 13th century church at Carteret is small, and, save its spire, seems almost buried in a graveyard chock full of shrubs and flowers and those ornamental iron crosses that are such common features in French rural God's acres. The edifice itself contains a striking rood-beam and carved Calvary. The beam is of Renaissance date, and does not run straight across, but takes an ogee outline on both sides, thus raising the cross itself well aloft. It consists entirely of boldly-conceived connecting carved scrolls, painted and gilded, of a character known in the cabinet-carving trade as *Cabriolet* work. Near the railway station a small new church is in progress, and is now ready to take the roof. It consists simply of nave and chancel; the walls of local blue limestone, with Caen stone dressings. Blocks of the latter are built up from the ground on both sides at intervals from east to west, suggestive of being ultimately work-d (as masonry is so commonly done in France) in *en vaulting* shafts to carry that kind of groining so common in old work in churches in Normandy and the adjacent Channel Isles. It was instructive here to notice the derrick in use for lifting and swinging the masonry into place. It is of the simplest construction, evidently planned and put together by the united efforts of some village wheelwright and smith, at small outlay of labour and material, but admirably adapted for the comparatively light work it has to do. Half-an-hour's shady walk along a tree-lined road brings one to Barneville-sur-Mer (although, as a matter of fact, the village is fully a mile away from the sea itself). The fine old Norm. church here has a tower at the east end of the south aisle of fortress-like strength, terminated with singularly shady machicolations. The exterior of the edifice is built of very small walling stones; these have recently been very much pointed with white mortar. This, unfortunately, gives the venerable fabric—at a little distance—the effect of an almost new structure. The Late Norman arcades, like the vaulting shafts, are surrounded by well carved capitals of the period, and are worthy of careful attention. Just outside the village, situated due east of the church, raised upon a high well-

wooded mound, and approached by successive flights of steps, is a tall and well executed Calvary of dark Finistère granite, the highly creditable work (some 30 years ago) of Mons. Hernet, the clever sculptor of Lannion in Brittany (to whose excellent work I referred in "Lannion: The Land of Great Stones," BUILDING NEWS, Oct. 30, 1902). Around the tall (monolith) shaft is entwined, its whole length, a broad band or scroll of inscribed copper. Upon the high sand dunes facing the sea in the neighbourhood of this village, quite a number of handsome villas have been recently erected, but the speculation has not proved a success, and only a few of them at present are occupied: the position, facing west, being so very much exposed. It is at La Haye du Puits that the railroad branches off, due north to Cherbourg, and east to Caen. These places are too well known to be referred to in these notes. If, however, the wayfarer finds himself at the former (stay at Marcel Vallet's Hotel de Paris, 10, Quai Alexandre III., six francs a day pension—exclusive of a demi-bottle of wine to lunch, and another at dinner); it is instructive, just at the present juncture, to compare the fine equestrian statue of Napoleon I., which stands boldly in the open space facing the sea, and near to the cathedral, with the confessedly disappointing model, ascribed to the late Alfred Stevens, which so many of us have recently seen in place, surmounting Wellington's memorial in St. Paul's Cathedral. The Cathedral of the Holy Trinity at Cherbourg, it may be remarked, is noteworthy for its Flamboyant tracery, its flying buttresses, its crocketed gables, and for its still more ancient saddle-back tower, crowned by the inevitable emblem of Peter's and mankind's instability in the shape of a weathercock. At St. Paul's we have seen a charger, of heavy Norman type, with a not very pleasant near hind leg (as viewed from the south aisle), and a dwarfed rider of the jockey type, who seems to lack proportionate length of thigh and body—possibly because of the foreshortening brought about by its elevated position. Further, why England's greatest military commander should grasp his charger's mane, and the reason the latter's tail should lash, is not altogether in evidence. At Cherbourg, we find Napoleon by far the best mounted of the twain; both horses are in almost exactly the same identical position, save that at Cherbourg, in spite of the exceptionally exposed position, the tail hangs in repose. The rider looks keenly across the sea towards England, pointing thereto with open hand, as if eager to clutch it. The difference, therefore, in the respective right hands of these two great generals is that whilst Wellington grabs at his horse's mane, Napoleon, more ambitious, appears to "go for" the British Main itself! But, to get back into rural Normandy again. Dotted over the whole face of the land are quite a multitude of interesting old churches, the majority of Norman or 13th-century date. The latter generally possess saddle-back towers (of which type the one at Brookthorpe, in Northamptonshire, may be quoted as an excellent example of about the same date). These towers are almost invariably crowned by a copper personification of a good old chanciere. At Le Haye-du-Puits, already mentioned, besides the old saddle-back towered church near the railway station, there is a good one in the midst of the village of Later character, and boasting of two western spires. Extensive and well-preserved remains also exist upon the outskirts of a moated chateau, its tower now a workshop, whilst the rest of the place is more or less desecrated. Now separated by a road is the "Donjon," an isolated, ivy-clad tower, a visit to the grim interior of which suggests many terrible associations. Curiously, as I sat, recently, in a humble hostel, almost beneath the shadow of this early keep, silent record as it is of Medieval terrorism. I chanced upon Samuel Taylor Coleridge's inimitable lines:—

"He prayeth best, who loveth best,
All things both great and small,
For the dear Lord who loveth us,
He made and loveth all."

If, in the Middle Ages, the proud owners of that once fair and noble castle had been guided by sentiments such as these lines convey the poor devils who, year in and year out, have from time to time rotted within those thick, almost windowless walls, might have had a much better time of it than they actually did. With these reflections I close.—HARRY HEMS.

During this week two statues have been placed on the new west façade of Hereford Cathedral, which has been built from designs by Mr. J. Oldrid Scott, and was illustrated in this journal on January 2 of this year. They represent St. Ethelbert and St. Thomas of Hereford, and are the gifts of the Duke of Newcastle and Miss Surtees Allnutt, of Hereford. They have been designed and executed by Mr. Fincher, sculptor, of Peterborough. They are partly reproductions of the mutilated effigy of King Ethelbert which is placed on a pedestal against the pier on the south side of the sacristy, and of the small figure of Sir Thomas de Cantelupe, which forms one of a group of mutilated figures over the tomb of Sir Peter de Grandison against the north wall of the Lady Chapel.

Roman Catholics of Small Heath, near Birmingham, who had hitherto worshipped in a workshop at Green Lanes, opened on Sunday their new school-chapel at the corner of the Coventry-road and Oldkuow-road. Space has been reserved on the Coventry-road side for a commodious church. Meanwhile the upper story of the school will be used as a chapel. There is seating accommodation for 300 worshippers, and 200 children can be taught on the ground floor. The architect is Mr. Percock, of Colmore-row, Birmingham.

Mr. W. R. Herring, C.E., engineer to the Edinburgh and Leith Corporations Gas Commissioners, has had his salary raised by £300 to £1,500 a year, in respect of his services in connection with the erection of the new gasworks at Granton, and on the understanding that he will continue to occupy his present post for a period of five years.

WATER SUPPLY AND SANITARY MATTERS.

ASHTON-UNDER-LYNE.—The sewage disposal works which have been constructed by the corporation of Ashton-under-Lyne were recently opened by the mayor. Before the completion of this undertaking the effluent of the sewers was discharged into the river Tame in a raw state. The works are on land about 45 acres in extent, on Plantation Farm, in the borough of Dukinfield. The bacteria beds are 56 in number, and each is about one-twelfth of an acre in area, with a working depth of about 4ft. For dealing with storm-water there is a set of nine filter-beds, with a total area of about an acre and a half, and a working depth of about 3ft. The roughing and precipitation-tanks are intended to be worked continuously, and are capable of containing about one and a third of the daily dry-weather flow, which is estimated to be 1,237,000 gals. The filtering medium in the bacteria-beds is composed of rough clinkers, brickbats, and fine clinkers, the coarsest layer being at the bottom, and the finest at the top. It is intended to work these beds in cycles of eight hours each per day, and under this system they will be capable of dealing with about 2,700,000 gal. every 24 hours, or a little more than two and one-sixth times the daily dry-weather flow. The cost of the undertaking has been £88,000. Messrs. Underwood Brothers were the contractors.

GLASGOW NEW SEWAGE PURIFICATION WORKS.—An important step in the progress of the drainage scheme of Glasgow was marked by the inspection of the Western District Sewage Works, which took place last week. The drainage area of the city is divided into three sections, each distinct from the others, with separate works for the disposal of its sewage. The first of these, authorised in 1891, and doubled in extent in 1901, comprises about eleven square miles, one-half being within the city, and the remainder in the landward district of the county of Lanark. The works for the treatment and disposal of the sewage of this area are situated at Dalmarnock, and the drainage is collected and conveyed there by a main sewer constructed at the cost of the Caledonian Railway Company. The second section was authorised in 1896, and includes the municipal area on the north side of the river, not provided for in 1891, the Burghs of Partick and Clydebank, and intervening parts of the Counties of Renfrew and Dumbarton, the whole extent being 14 square miles. The works for the disposal of the sewage derived from this area are situated on the river bank at Dalmuir, about seven miles below Glasgow. The third section, authorised in 1893, comprises the whole of the municipal area on the south bank of the river, the Burghs of Rutherglen, Pollokshaws, Kinning Park, and Govan, as well as various residential and rural districts in the counties of Lanark and Renfrew. The extent of this section is 14 square miles, and it may be enlarged by the inclusion of the Burghs of Paisley and Renfrew. The works for the disposal of the sewage of this area will be situated on the river bank at Braehead, about one mile eastward from Renfrew. For the collection and disposal of the 97 million gallons of sewage within this divided territory there will be constructed thirty miles of sewers, varying in size from 2ft. 6in. in diameter to 10ft. The principal features of the western scheme are the construction of an outfall sewer to convey the drainage of the higher levels of Glasgow and Partick to the works at Dalmuir; the construction of an intercepting sewer to collect the drainage of the lower levels of the city, the construction of an intercepting sewer to collect the drainage of the lower levels of the burgh of Partick; and a third intercepting sewer to convey to the Dalmuir Works the drainage of the burgh of Clydebank. The Glasgow and Partick intercepting sewers will be pumped into the outfall sewer at Partick Bridge, the lift being 37ft. The pumping engines, three in number, are of the triple-expansion inverted marine type, with plunger pumps, each capable of raising 11,250 gallons per minute, or 16 million gallons per day. Steam is supplied to these engines by four boilers, working at a pressure of 160lb. per square inch. The Clydebank intercepting sewer will be pumped at Dalmuir, the lift being 21ft. The smaller engines at Dalmuir will be of the centrifugal type, and power for the sewage treatment plant will be transmitted by electricity. The Sewage Committee have resolved to adopt at Dalmuir and Braehead the same method of sewage treatment as that which has for the last seven years been in successful use at Dalmarnock, with this exception, that the sludge presses, which by the compulsion of the situation of Dalmarnock works have been employed there, are to be dispensed with, and the liquid sludge carried out to sea. The western outfall sewer has now been constructed; the Partick and Clydebank intercepting sewers are virtually finished; the Glasgow intercepting sewer is being vigorously advanced; the Partick pumping-station is nearing completion; the precipitation-tanks, dock, wharf, and outfall works at Dalmuir are constructed; and the sludge-tanks, pump-house, machinery, and other works are sufficiently advanced to warrant the hope that the greater part

of the sewage derived from the western area will be undergoing purification during the course of next year.

TODMORDEN: THE GORPLEY WATERWORKS.—The Todmorden Corporation is constructing a waterworks at Gorpley, and when it is completed the present reservoir at Ramsden will be transferred to the Rochdale supply district. Gorpley Clough is only two miles from the centre of Todmorden, but provides a gathering ground of 720 acres. The new reservoir will have a capacity of 120,000,000 gal. At top water-level it will be 15½ acres in extent, and there will be a maximum depth of 76ft. When full the surface will be 845ft. above sea level, while the collecting area runs up at one point to 1,172ft. The amount of supply available in the driest weather will be about 690,000 gal. per day, exclusive of the compensation water. The full width of the embankment dam will be 924ft.; its height above the lowest foundation will be 116ft., and above the bed of the stream 88ft. Two stone "toes" prop up the foot of the embankment on each side, so as to give stability to the earthwork in the event of flood. The core of puddled clay is 20ft. thick at the bottom, and tapers off to 6ft. at the top. The inner side of the dam will be faced with stone to a depth of 15in. The by-wash, to carry off the surplus water, is of masonry and concrete, 15ft. wide. The supply is drawn off by means of a valve-tower at the opposite side of the dam to the by-wash. From this tower the water will pass in a 12in. pipe under the embankment into a tunnel which leads to the five filter-beds. The line of 15in. pipes from the tank to Rochdale-road, a length of about one-and-a-half miles, has already been laid. These pipes will in time be coupled up to the existing mains, which will be purchased from the Rochdale Corporation by the local authority. The work was begun about May, 1900, and the time fixed for its completion is four and a half years. The plans were prepared by Mr. G. F. Deacon, M.I.C.E., of Westminster, while Mr. J. H. Parkin, A.M.I.C.E., is acting as resident engineer for the corporation. The contract has been let to Mr. B. Lumb, of Todmorden, for £49,000.

THE TALLA WATERWORKS FOR EDINBURGH.—The members of the Edinburgh and District Water Trust paid an official visit of inspection on Friday to the Talla works portion of the scheme for bringing into the city the additional supply of water which was entered upon eight years ago. There are at present over a thousand men engaged all over the works, and some two-thirds of that number are working at the Talla. The visitation of the Trust was therefore directed on this occasion to what has been going on at the source of the new supply and to seeing for themselves the progress of the work during the past year. The visitors travelled from the Caledonian Station in Edinburgh right up to the Talla works over the contractor's railway, and they were met there by Mr. W. A. Tait, the engineer of the Trust, who conducted the company over the works and explained the various operations. On arriving at their destination the party saw the cut-and-cover work which makes the aqueduct leading to the tunnels and pipes which convey the water to the city. They were afterwards shown the measuring-room, through which all the water will pass into the city from the reservoir, and Mr. Tait explained the manner by which, through screens and other means, nothing offensive will be allowed to pass into the aqueduct. It was explained that the greatest height of the embankment from the bottom of the trench which is to dam the water will be 124ft., and of that 37ft. has to be finished. This trench has been carried about 80ft. below the original surface of the ground, and the highest point is 91ft. The reservoir to be constructed will supply 3,000,000 gallons per day, equal to the total storage which the Trust has at present for the whole supply of the district. Among those present at the inspection were Mr. Massey, burgh engineer; Mr. W. Carstairs Reid, C.E.; Mr. Wm. Black, superintendent of works; and Mr. Sculley, surveyor of the Water Trust.

The parish-hall, Faversham, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. Pearson-Gregory, of Harlaxton Manor, has given a carved oak screen to the parish church of Harlaxton, South Lincoln. It was designed by Mr. J. Oldrid Scott, F.S.A., and executed by Messrs. J. E. Elwell and Sons, of Beverley.

The Higher Grade School, Greenock, was formally opened on Friday. The new school, which has been erected and equipped at a cost of over £20,000, consists of two buildings, one of three stories, and another separate building of two stories. The main structure fronts Dampier-street and Trafalgar-street, the smaller building fronting Wellington-street. There is accommodation in the school for 968 pupils.

LEGAL INTELLIGENCE.

THE HOUSING OF THE WORKING CLASSES ACT.—At Lambeth County-court, on Wednesday, in the course of the case of "Carr v. Richardson," Judge Emden made some observations on the working of the Housing of the Working Classes Act, 1890. The plaintiff, who was the weekly tenant of a house on the canal bank, New Church-road, sought to recover from his landlord, a builder, £5, for damages caused by the fall of a ceiling. It was alleged that the defendant was liable to do the repairs to the house, and that he had been guilty of negligence in not carrying them out. The plaintiff had gone into occupation of the premises in April, 1902, and the accident happened on June 5, 1903. His Honour observed that the plaintiff could not base his claim upon negligence. It was then alleged on behalf of the plaintiff that the defendant had been guilty of a breach of the warranty of fitness for habitation which the law requires. Reference was made to section 75 of the new Housing of the Working Classes Act, 1890, which provides that in any contract made after August 14, 1885, for letting for habitation by persons of the working classes a house, or part of a house, there shall be implied a condition that the house is, at the commencement of the holding, in all respects reasonably fit for human habitation. It was submitted that this enactment rendered the defendant liable, and that, even assuming he was not cognisant of the state of repair of the premises in 1902, he became liable on April 29, 1903, when he was informed that the ceiling was defective. His Honour, however, non-suited the plaintiff. In giving judgment, he said that the Act did not go nearly far enough. As the law now stood, poor people, who must needs find shelter somewhere, entered premises which might seem to be all in order at the commencement of the holding; but if any defect made itself known subsequently, they were entirely helpless. The fact was that persons who became landlords of this class of property endeavoured to make as much out of it as possible without doing anything themselves. The Act should be amended. Making these observations, however, he did not wish to disparage the defendant, whose evidence he had not heard. Judgment was given for the defendant, but without costs.

IN RE WILLIAM TAYLOR, MOSS SIDE, BUILDER.—At the Salford County-court on Monday, Mr. Acton supported an application for the discharge from bankruptcy of William Taylor, who was formerly in business with his father, Charles Taylor, at Moss Side, as joiner, builder, and property repairer, under the style of Charles Taylor and Son. According to the Official Receiver's report, the applicant was made bankrupt in September, 1891. The partnership liabilities at that time were estimated at £2,853, but the proofs actually admitted and probable claims not yet admitted amounted to £2,933. The partnership assets, so far as they had not been assigned to creditors wholly or partly secured, were estimated to produce £1,828, but they only realised £140 9s. 9d. The great difference was mainly accounted for by the fact that the debtor valued certain equities of mortgaged properties at £1,626, and they turned out to be entirely valueless. Only £93 18s. 4d., therefore, was available for distribution, and a dividend of 4½d. had been paid on proofs for £2,554 7s. It was alleged that the debtor had committed several offences under the Bankruptcy Acts, but, taking all the circumstances into consideration, the Judge thought that justice would be met if he granted Mr. Taylor his discharge, suspending it for two years. He granted the discharge, therefore, on those terms.

THE LIVERPOOL TIMBER FAILURE.—At the recent meeting of creditors of Messrs. Lighthound, Rigby, and Co., timber merchants, of Liverpool, substantial assets were reported (mainly consisting of margin over securities) of the Oakhill Park building estate near Liverpool, which Mr. Charles Latham, the senior partner of the firm, had purchased and developed in conjunction with Mr. W. A. Thorburn, who was to have half the profits and to manage the estate. At the Lancashire Chancery Court, Liverpool, on Tuesday, before Mr. W. F. Taylor, the deputy of the Vice-Chancellor, Mr. J. Rutherford applied, on behalf of the Bank of Liverpool, as second mortgagees of the Oakhill estate for £19,000, for the appointment of a receiver of the rents and profits of these properties. On behalf of Mr. Thorburn the claim was put forward that, subject to the various advances made on the property, he was entitled to a full half-share of the profits, and he preferred to pay in to an account the whole of the rents and profits of the properties, pending the trial of the action. Mr. Rutherford demanded and urged the right of the Bank to have an independent receiver appointed. The Deputy Vice-Chancellor decided that the application was well founded and made the order asked for. It was agreed that Mr. Eshelby (Harwood Banner and Son) should be appointed receiver.

The new town-hall at Oundle is to be opened on Wednesday next by Lord Lilford.

BOARD SCHOOLS AT BRIGHTON.—XXVII. AND XXVIII. PALL MALL.—CENTRAL LIBRARY, HAMMERSMITH.—LANGWICH LODGE, NOTTS.—CHAPEL AND SCHOOL AT SEVEN KINGS.—THE HALL, PARKWOOD, HENLEY-ON-THAMES.—NEW LIBRARY, CASTLEFORD.—HALL FURNITURE FROM THE CONTINENT.

Our Illustrations.

BOARD SCHOOLS AT BRIGHTON.

THESE schools were designed for the now defunct school board for Brighton and Preston U.D., and were carried out in collaboration with Messrs. Thomas and Gilbert Simpson, the surveyors to the board. In view of the tendency of the new educational authorities throughout the country to economise, the buildings were executed for a fraction under 6½d. per foot cube, including playgrounds and boundary walls, and the interiors were finished with English glazed tile dados throughout the corridors and classrooms. Elm-grove school is interesting as having been planned with one large hall for the joint use of three departments, the peculiar configuration and rapid slope of the site permitting the evolution of a special type of plan. Both buildings were erected in a satisfactory way by Mr. P. Peters, of Horsham. The walls are faced externally with picked stocks and Lawrence's red bricks. The roofs are covered with Broseley tiles. The illustrations are from sketches made on the spot by Mr. Raffles Davison, and exhibited at the Royal Academy this year. The architect is Mr. John W. Simpson, of Verulam Buildings, Gray's Inn, W.C.

NOS. XXVII. AND XXVIII. PALL MALL.

This building was erected by the Wilkinson Sword Company, Ltd., who have their show-rooms, offices, board-room, &c., on the ground floor, and a wide oak staircase leads from the ground floor to the basement, the front portion of which is used as a showroom. The entrance to the three floors of offices and the three floors of bachelor's chambers above is in Pall Mall, the whole now occupied by the War Office as offices, and are served by an electric lift made by the Otis Company. All the rooms are warmed by hot-water, and hot water is also provided for the lavatories. The front is executed entirely in Portland stone, roofed with thick Westmoreland green slates. The elevation to St. James-square is in red brick and Portland stone; the red facing bricks, which are 18in. by 2in. by 4½in., were specially made for the job. The contractor for the works was Mr. J. Carmichael, of Wandsworth, and Messrs. J. McCulloch and Co. executed the carving to both fronts. The whole of the work was executed from the designs and under the superintendence of Mr. F. E. Williams, A.R.I.B.A. The drawings which we reproduce to-day were hung at the Royal Academy this year.

HAMMERSMITH PUBLIC LIBRARY.

This plan in its main arrangement is exceedingly like the design which was placed first in the recent limited competition, and in the location of the chief rooms is identically the same. In order to get height for the public reading-rooms, which are 16ft. high in this design, the rear part of the

buildings behind the connecting corridor on the first floor are kept as low as possible without impairing the efficiency of the lending library. By this contrivance the cube, to save expense, was minimised, and the advantage of top lighting for the newspaper-room, as well as the boys' room and ladies' room, is obtained, while the borrowers' space is perfectly lighted in front of the indicators. The reference-room books are arranged in three tiers to the rear, thus avoiding carrying this bookstore over the lending library stack-room below. The committee-room, which is of the stipulated size, has a lavatory, &c., attached, which is important, this room being intended for the use of the librarian as his office. The borrowers' hall is arcaded, as indicated on the plans. The caretaker's rooms are to the rear over the reference books stack-room and tower, which contains the private staircase, so arranged as to be available as an emergency staircase for the public in case of fire. The materials specified are red brick and Portland stone, and green slates for the roofs. The design placed first was illustrated in the BUILDING NEWS for Aug. 28, and Mr. H. T. Hare is its author. The accompanying design is by Mr. Maurice B. Adams.

LANGWICH LODGE, NOTTS.

THIS house, situated about midway between Mansfield and Worsop, has been built for the Duke of Portland's agent, on the site of an old house of no architectural interest, very inconveniently arranged and somewhat dilapidated. The position of the former building decided that of the present one, with its aspect due south; and the domestic offices on the north and west sides. The foundation is on solid rock, and the ground slopes down to a lake in front of the house, this inclination giving the suggestion and affording the facility for the terraced arrangement of the garden, which is in process of being carried out. Croquet and tennis lawns have been formed at the east side of the house, with a rose garden, pergola, and shady walks beyond, and there are some very fine old trees. The new building occupies less ground than the former one which was demolished, but it provides considerably more accommodation. That on the ground floor will be seen on the plan, and there are large cellars. On the first floor are five bedrooms, three dressing-rooms, day nursery, schoolroom, linen-room, and bath-rooms, &c., and on the second floor eight bedrooms, boxrooms, and bathroom, &c. The house is faced with red bricks of a quiet colour, with Anston stone dressings, and green (Buttermere) slates, the woodwork being painted white. The staircase and principal doors on the ground-floor are mahogany, and the floors of narrow pitch-pine boards with "pavodilos" joints. The walls of the hall, staircase, and drawing-room are panelled, and these rooms have ornamental plaster ceilings by Messrs. Garvie and Sons. The walls of the kitchen, lavatories, and bathrooms, &c., are lined with blue and white Dutch tiles by Messrs. Martin, Van Straaten, and Co., and those of the scullery and larder, &c., with white tiles. The house is lighted by acetylene gas, and partly heated by water, on the low-pressure system. "Rational" grates are used throughout, and the chimneypieces are of 18th-century style. The furniture of the principal rooms and bedrooms is chiefly old, most of it being of the Chippendale and Sheraton periods, with some earlier pieces, and many old paintings and prints, &c. Mr. Eastwood, of Worsop, Notts, was the builder, Mr. Hellis the clerk of works, and Mr. Louis Ambler, F.R.I.B.A., of London, the architect. The cost of the house was about £3,000. The existing outbuildings and stabling, &c., were extensive, and have been altered to suit the present requirements, this and the garden work having been carried out by the Welbeck estate workmen from the architect's designs.

PRIMITIVE METHODIST CHAPEL, SEVEN KINGS, LONDON, E.

THIS chapel is to be built of red pressed facing bricks, with stone dressings, green Westmoreland slates being used for the roof. There will be an open ornamental timber roof in the interior. The windows are to be glazed with leaded lights. There will be seating accommodation for 400 persons in the chapel, and 300 children in the schools. A minister's residence adjoins the chapel. Mr. H. Ascough Chapman, A.R.I.B.A., Prudential Buildings, Leeds, is the architect.

THE HALL, PARKWOOD, HENLEY-ON-THAMES.

THIS house has been erected on the estate of Parkwood, about 3½ miles from Wargrave and

Henley-on-Thames, as a country residence for the owner, Mr. Charles S. Henry. The work was carried out by Messrs. John Botttrill and Sons, of Reading, as general contractors. The architect is Mr. Wm. Flockhart, F.R.I.B.A., New Bond-street, London, W. The interior finishings of the hall shown in this illustration, and of the other principal rooms (except the drawing-room), are panelled in oak and other hardwoods, and have been executed by Mr. J. S. Henry, of Old-street, E.C. These two firms have carried out their work in a way which does them the greatest credit. The lower portion of the hall fireplace is executed in Ham Hill stone, and the upper part in gauged and rubbed brickwork in diminishing courses. This drawing was shown at the Royal Academy this year. We gave a view and plan of Parkwood in the BUILDING NEWS for July 24, 1903.

CASTLEFORD LIBRARY: SELECTED DESIGN.

THIS library design was awarded first premium in the late competition with 124 competitors, Mr. Butler Wilson being the assessor. It is proposed to be built of terracotta, and the roof covered with dark green Westmoreland slates. The chief point in the plan is the position of the librarian's office, from which point he will be able to supervise the different rooms. Mr. G. H. Vernon Cale, of Birmingham, is the architect.

HALL FURNITURE FROM THE CONTINENT.

IT would be somewhat difficult to exactly allocate the correct dates to these pieces of Elizabethan or Stuart furniture, though they resemble in a few of their characteristic details some well-authenticated pieces of a like kind. They are all now in Continental galleries; but may have come originally from Scotland, showing how eminently traditional the work of their time was, and herein remains much of its interest. These pieces are eminently suggestive and adapted to present-day uses.

CHIPS.

On Saturday afternoon, the new vicarage at St. Paul's Church, Royton, Rochdale, was formally opened. The building stands on the site of the old one. It is of red brick, with white stone dressings, and adjoins the churchyard. It has cost about £2,000.

At the last meeting of the urban district council of Ichen, near Southampton, the sanitary committee recommended the payment of the final amount due to Mr. F. Osman, of Southampton, in respect to his contract at the outfall works. The vice-chairman, Mr. Hayward, in moving the adoption of the report, said that the contract worked out at £3,739 17s., and including the breeze used the amount was £11,000.

A faculty has been granted in the York Consistory Court to the vicar and churchwardens of Ulrome, near Hull, to build a new upper part to the tower of the church, a porch on the south side of the nave, and to fix a clock in the tower with three skeleton faces.

Mr. F. W. Pomeroy, sculptor, of London, has been commissioned by the Scottish Associations of New South Wales to execute a bronze statue of Robert Burns for erection in the Sydney Domain on a site to be given by the State Government.

Last week saw the completion of the widening of Cadzow Bridge, in the centre of Hamilton, which carries the leading thoroughfare of the town over the ravine through which the rivulet of Cadzow makes its way to the Clyde. The bridge, which was built seventy years ago, consists of three arches, each 60ft. span, and the top of the parapet wall is about 60ft. above the bed of the burn. Eight feet have been added to each side of the bridge, and massive parapets built of Dumfriesshire old red sandstone.

The work of laying the storm-water sewer from the Police-station at Sevenoaks, through Seal Hollow-road and St. John's, to discharge into Greatness Mill Ponds, is being rapidly pushed on. The work will be finished before the winter. It will cost some £4,500.

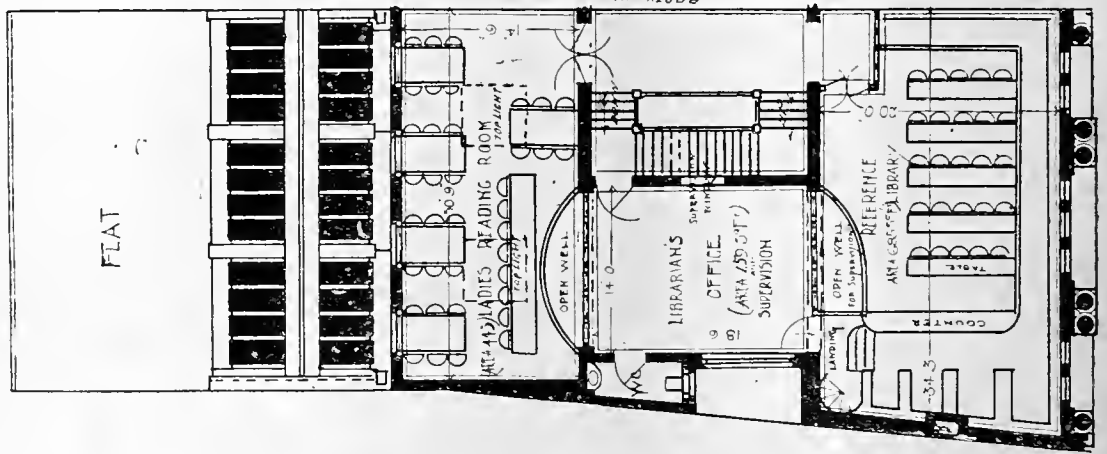

On the Latchmere Estate, Battersea, three, four, and five-room tenements—with a few small houses—have been erected by the Housing and Works Committees of the Borough Council. When the building on the estate is completed, there will be in all 173 houses, with accommodation for 315 families, or about 2,000 people. Every tenement is fitted with kitchen, copper, bath, and sink, and has its own little piece of garden. The houses are brick-built, the heads and sills to the windows and the canopies over the entrances being of granolithic. The whole of the cost, amounting to £105,000, will be met out of the rents.

A RETURN has been made, by order of the House of Lords, showing from Oct. 1, 1892, to Dec. 31, 1902, the extent of land acquired by local authorities under the Small Holdings Act, with the date of such acquisitions and the parish or parishes in which the land is situate; the sum for which the land was purchased, or the term and rent for which it was hired; the amount spent on the adaptation of land for small holdings; the number and total acreage of small holdings sold, with the amount of purchase-money; the number let and their acreage, with the yearly rent and terms of letting and the number and total amount of the advances made under the Act. During the period of somewhat over ten years with which the return deals, eight county councils in England and one in Scotland have acquired land under the Act. The extent of the land acquired in England was 569 acres, including 181 acres by the Lincoln (Holland) County Council and 147 acres by the Worcestershire County Council. Only 47 small holdings, with an acreage of 164, have been sold, 32 of them in Worcestershire; while 166, with an acreage of 373, have been let. In the county of Ross and Cromarty 83 acres have been acquired, and have been purchased by 25 buyers. The average price given by local authorities, omitting transactions in London, was £36 per acre, the cost varying from £14 in Ross and Cromarty and £23 in Cambridgeshire to £70 in Devon; and £2 per acre has been spent on the adaptation of the land.

The R.I.B.A. examinations of the present autumn will be held as follows:—The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., on Nov. 3 and 4. Applications must be sent in on or before Saturday in next week, Oct. 10. The Intermediate Examination, qualifying for registration as Student R.I.B.A., on Nov. 3, 4, 5, and 6. Applications must also be sent in on or before Saturday, the 10th inst. The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., from Nov. 13 to 20 inclusive. Applications must be sent in on or before Saturday, the 24th inst. The testimonies of study, &c., with the necessary fees, must accompany the applications, all of which must be addressed to the Secretary R.I.B.A., at the offices of the Institute. Examinations qualifying for the office of district surveyor in London (pursuant to the provisions of the London Building Act 57 and 58 Vict. c. ccciii. s. 140) and of building surveyor under local authorities will be held by the Royal Institute on Oct. 22 and 23, 1903. Applications must be sent to the Secretary R.I.B.A., 9, Conduit-street, W., on or before Thursday next, Oct. 8.

The syllabus has been issued of the new Manchester School of Architecture, an addition to the educational institutions of the city which has been called into existence by the joint arrangements of Owens College, the Municipal School of Technology, the Municipal School of Art, and the Manchester Society of Architects. The appointment of Prof. S. H. Capper as director of the new school has been already announced. Prof. Capper's career began at Edinburgh University, where he took first-class honours in classics. Thence he went to Heidelberg, and afterwards he took a special course of architectural study at the Ecole des Beaux Arts, in Paris. Returning to Scotland, he practised for some years the profession of architecture in Edinburgh, and was appointed lecturer at the University and examiner for the Master of Arts degree in art history and archaeology. Seven years ago Mr. Capper went to Canada, where he held at the McGill University in Montreal, a similar position to that which he has now taken up in Manchester. The work of students in the School of Architecture will be carried on partly at Owens College, partly at the Municipal School of Technology, and partly at the Municipal School of Art, and the syllabus has been arranged, in consultation with Prof. Capper, by a committee upon which Mr. J. W. Beaumont and Mr. Paul Ogden represent the Manchester Society of Architects. This new School of Architecture will provide Manchester with educational opportunities which it has not hitherto possessed. Prof. Capper's students will have the opportunity of proceeding to the degree of the Victoria University and taking honours in architecture, just as those at Liverpool had under Prof. F. M. Simpson before the partition of the colleges.

By way of introduction to the work of the school Prof. Capper has arranged to give a series of free popular lectures at Whitworth Hall during October and November, the subject being "History in Architecture." A first-year course has been mapped out for students who intend to take the degree of the Victoria University in the Honours School of Architecture, and the inclusive fee for the full course has been fixed at eighteen guineas. There are, in addition, certain special courses at lower fees. It will not be attempted at Manchester to supersede that side of training for professional practice which is only fully gained by practical employment in offices and works. The university course is intended chiefly to provide for a thorough grounding in the principles upon which professional practice is ultimately based.

A WELL-ILLUSTRATED account of the London County Council's housing schemes is contributed to *Public Works* by Mr. G. P. Knowles, P.A.S.I., surveying assistant in the Housing Section of the Architect's Department. Few people have any idea of the magnitude of the work the London County Council is doing, and doing—thanks mainly to the energy and skill of its architect, Mr. W. E. Riley—with a thoroughness and energy that assuredly mark out a future for it of usefulness and importance that it is hardly possible to over-estimate. It may very well be the work of the Housing Department of the L.C.C. to rebuild half London before the present century has expired, if we can once tax ground values, and give the municipalities powers to provide dwellings for those who are just as much the "working classes" as its present *protégés*, and quite as much the victims of the jerry-builder and the ground-landlord.

A LARGE party of German municipal and official authorities, representative of all the States of the German Empire, connected with the Central Bureau in Berlin, which deals with the question of the housing of the working classes, commenced a round of visits in England with a view to obtaining information from the various municipal and private organisations dealing with the housing problem. The party which is under the leadership of Dr. Von Edderger, Dr. Professor Oldrecht, and Herr Brederick, started from the offices of the London County Council, after obtaining particulars of the Council's housing schemes. They drove through the slums of Whitechapel, and after visiting the site of the London County Council's Boundary-street scheme, went on to the Whitechapel Rowton House. Here they were received by Sir Richard Farrant, the deputy chairman, and Mr. S. J. Earle, the surveyor, and were by them conducted round the building. Later in the afternoon the party paid a visit to Bromley-street Workhouse. The party proceeded to Birmingham yesterday (Thursday), and visited the Bournville estate. In the evening they departed for Liverpool. After a day spent in that city the party will proceed to Port Sunlight and Glasgow.

PROFESSOR LOW, whose name is so well known as an author of books on drawing, has invented some drawing appliances which certainly deserve the attention of architects, surveyors, and engineers. The set-squares, protractors, and scales which Messrs. Longmans, Green, and Co. have sent us bear out all the prospectus says about them. The set-squares are framed in the usual way, and are made of white tough wood covered with a thin facing of celluloid which leaves off short of the drawing edge, say, about $\frac{1}{16}$ in. or so. By this means the drawing edge of the instrument or square stands above the paper, leaving a clear space to the extent of $\frac{1}{16}$ in. This slight elevation is not enough to interfere with the accuracy of linear delineation; but it reduces the chances of ink blobs, blotting, and smearing.

EVERYBODY who draws knows the trouble caused by the ordinary set-square, especially in tracing, and more particularly when the drawing traced is not perfectly flat. Prof. Low's set-squares are made in two kinds. The A variety has transparent celluloid edges so that the user may see through and ascertain the exact position of his square with regard to the lines under its edge, or B, the kind which has hard ebonyised wood edges just as in the ordinary mahogany-framed square. The celluloid facing, in either case, is smooth and white, covering both sides of the squares. The material adds to the strength of the framing, and the squares are exceedingly light and convenient to manipulate. When dirty they can be easily washed, and, what is of moment, they are very in-

expensive, the largest sizes, 8 in. and 12 in. respectively, for the 45° and 60°, being only 2s. each. The adjustable protractor set-square is, of course, made out of the solid, one side of the plate of white celluloid being engraved so that in constructing or measuring angles every degree from 0° to 90° may be accurately determined. The objection to celluloid for scales is its high coefficient of expansion or contraction with variation of temperature, and cardboard scales are not durable. The Low scales now before us are made of wood, covered with transparent celluloid to the thickness of $\frac{1}{1000}$ part of an inch, making them very strong, and not liable to alteration by atmospheric conditions. They are made 9 in. and 12 in. long, and are divided into foreign and English scales available for every kind of drawing and measuring off plans. The set of three is sold for a shilling. Tee-squares are about to be introduced on the same principle as the set-squares.

THREE interesting publications have just reached us from Messrs. Verity's, Ltd., of London, Manchester, &c. Two consist of small books, one devoted to electric stoves for warming purposes, of the type frequently employed, consisting of special incandescent lamps placed before a suitable reflector. Several varieties of these stoves are shown in an attractive booklet. The other small book is a collection of photographs of electric light fittings of pleasing design and appearance. They are modern in character, and should form a useful addition to an architect's collection of price-lists. The third and more important publication is a catalogue of electric light fittings, consisting of 160 pages, containing several hundred designs, ranging practically through every possible style of decoration, from simple brackets, pendants, and electroliers of a few shillings in value to elaborate designs running into many pounds. All three books are nicely got up, and no doubt a postcard to Messrs. Verity's, Ltd., will insure the delivery of the three books to anyone interested.

MESSRS. DENT AND HELLYER, their present premises being required by the London County Council for the Holborn-Strand improvements, are removing their business, established over a century and a half ago, to 35, Red Lion-square, and 75, Theobald's-road, W.C., where, we are sure, they will enjoy a continuance of the confidence and support deservedly extended so long. Few firms have such a time record, and none have better justified their long existence by successful determination to keep abreast of the age.

The Carpenters' Company announce their annual series of lectures on "Sanitary Building Construction" to commence next week, and we notice that the lectures are on the usual useful subjects, and that they will be of interest is guaranteed by the names of the lecturers. These lectures are preliminary to the examination held by the Company in November next, and also are primarily intended for candidates proposing to sit for that exam., but are open to others interested in sanitary matters. Tickets for admission to these lectures can be obtained from the clerk.

A COMPUTER of pipe discharge arranged like a circular slide rule has been designed by Mr. Charles Anthony, jun., M.Am.Soc.C.E. It is based on Manning's formula, $v = R^{2/3} S^{1/2} \div n$, in which v is the velocity in feet per second in the pipe or channel, R is the hydraulic mean depth, S is the sine of the inclination, and n is a coefficient having the same values as the n of Kutter's formula in most cases. The instrument can be used with equal rapidity and precision with metric or English measures. It has four concentric graduated circles, the inside and outside fixed and those between movable. The inside circle has scales for v , the next scales for R , the third for S , and the outside circle for n . The instrument is made by W. F. Stanley and Co., London.

ACCEPTANCE tests for cement were discussed at the recent meeting of the American Society for Testing Materials by Mr. E. S. Larned. It is common practice to use the average of the results as a measure of the cement's quality, and the extreme variations sometimes recorded are probably chiefly due to a difference in the manipulation of the samples rather than to any variation in the quality of the cement. It is necessary to choose between taking the mean of the results of a number of individual samples, or mixing all the samples together thoroughly and testing the

mixture. Mr. Larned believes that the latter plan is the better, and he also endorses the decision of the U.S.A. Board of Engineer Offices, appointed to establish requirements for cement, to judge a shipment by the best results obtained, and not by the mean of all the results. In respect to tests for soundness, Mr. Larned emphasises the fact that in actual work the cement has an opportunity for seasoning between the time of its arrival on the work and its actual use. Moreover, when the cement is unbarrelled and mixed with sand more or less damp, it receives a thorough aëration and some hydration before it is used. On the other hand, the cement is often tested for soundness immediately on its receipt, and it is obvious that laboratory determinations under such conditions do not represent fairly the action of the cement in use.

At a meeting of the Court of the Paviers' Company on Wednesday the awards in connection with the recent competition by essays, drawings, and models on the subject of "subways or other means of placing and maintaining without interference with the surface, the main pipes and services of gas, water, and other undertakings below the carriageways or footways of cities, boroughs, and towns," were declared. Twenty-six competitors submitted essays, drawings, and models. The first premium of £105 is given to Mr. R. M. Parkinson, 93, Lincoln-road, Peterborough; the second premium of £31 10s., competitor's name at present unascertained; the third premium of £21 to Mr. P. M. Royle, A.M.Inst.C.E., 3rd Avenue, Sherwood Rise, Nottingham.

CHIPS.

The new transepts of the chapel at Harrow School, erected in memory of those who lost their lives in the South African war, will be consecrated by the Bishop of London at 11 a.m. on Thursday in next week.

The county council of Clackmannan have adopted plans and copy of report on Menstrie drainage scheme, at an estimated cost of £1,450. Mr. W. R. Copland, C.E., is to carry out the scheme, and application will be made for power to borrow £2,000. A report by Mr. Copland on the Clackmannan water supply has been remitted to the Clackmannan Water Committee to consider.

Mr. Cuthbert Brown, for the past seven years waterworks engineer and surveyor to the Bedlingtonshire Urban District Council, Northumberland, and previously on the staff of the city engineer of Newcastle-on-Tyne, has been appointed, out of 158 applicants, water engineer and borough surveyor to the corporation of Chelmsford at a commencing salary of £305, rising to £350.

At the final meeting of the Huddersfield School Board, held on Monday, the chairman stated that the 17 schools provided accommodation for 12,938 children, and had cost £179,170.

The new covered wholesale market, which has been erected by the Wolverhampton Corporation at a cost of upwards of £16,000, will be opened on Monday next by the mayor.

At the last meeting of the Bradford School Board, a site for a new infants' school at Undercliffe, containing 7,998 square yards of land, was purchased for £1,235. It was also decided that the salary of the architect to the board (Mr. W. Vaughan) be increased to £320 per annum. Application was ordered to be made to the Public Works Loan Commissioners for loans amounting to £10,877 for works at Lorne-street School, Horton Bank Top, Thackley School, and Thornton School.

The church of St. Lawrence, on Lawrence Hill, Bristol, built in 1885, was reopened last week after redecoration, the laying of a new floor of pitch-pine, and the installation of incandescent gas-lighting. The general contractor is Mr. E. Walters, of Montpellier, and the architect Mr. W. V. Gough, of Bristol.

The ceremony of laying the memorial-stones of the Wesleyan chapel which is in course of erection in Pickwick-road, Corsham, took place last week. The chapel is erected in front of the old elifise, which will be utilised in future as a Sunday-school. The new building, which is in the Gothic style, with open timber roof and traceried windows, will provide seating accommodation for 300, and will cost £1,500. Mr. Bromley is the architect, and the contractor Mr. Moore, of Trowbridge.

A firm of Glasgow accountants have issued a circular stating that Messrs. McDowall and Neilson, timber merchants, of 55, West Regent-street, Glasgow, have been obliged to suspend payment. The firm has been in existence for about twenty years, and since the death of McDowall, a few years ago, has been carried on by Mr. Neilson. The liabilities, exclusive of speculative commitments, amount to over £100,000.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Liverpool Incorporated Society. Opening Address by the President, John Woolfall, F.R.I.B.A., 13, Harrington-street. 6 p.m.

TUESDAY.—Institute of Builders. Finance Committee. 3.30 p.m. Council Meeting. 4 p.m.

WEDNESDAY.—University College, London. Introductory lecture in the School of Architecture on "Architectural Evolution," by Professor F. M. Simpson, F.R.I.B.A. 5 p.m.

THURSDAY.—Eastern Counties Master Builders' Federal Council Meeting, 2.30 p.m.; General Meeting at 3 p.m., Crown and Anchor Hotel, Westgate-street, Ipswich.

Carpenters' Company's Free Lectures. "Sanitary Arrangements of Free Buildings," by Dr. A. Wynter Blyth. 8 p.m.

THE ARCHITECTURAL ASSOCIATION.

COURSES OF INSTRUCTION IN ARCHITECTURE. The Day and Evening Schools are now in progress. Intending students are requested to forward their names to the Secretary as early as possible.

A pamphlet giving full information as to the Classes and advantages of membership may be obtained upon application to the Secretary, at 55, Great Marlborough-street, London, W.

LOUIS ANGLER, } Hon. Secs.
H. TANNER, Jun. }

The foundation-stone of a Roman Catholic church, to be dedicated to St. Hugh, was laid on a site in Earle-road, Liverpool, on Sunday by Bishop Whiteside. The church will be built at a cost of £6,000, which sum has been given by Mr. William Nelson.

On St. Michael's Day a new clock, with new chimes, adapted from one of Dr. Wesley's anthems, by Messrs. Wm. Potts and Sons, clock manufacturers, Leeds and Newcastle-on-Tyne, and being the first time used in a public clock, was set going at the parish church of Keighley.

The Usworth School Board have appointed Mr. Stephen Wilkinson, Chester-le-Street and Mosley Chambers, Newcastle, architect for the new schools at Springwell, to accommodate 500 children. His plans were placed first in a limited competition.

The chancel of St. Margaret's Church, Aberdeen, is to be completed as a memorial to the late Rev. John Comper, the founder and first rector. The architect is Mr. J. N. Comper, son of the late rector, from whose designs a chapel of St. Nicholas was added to the building some years since.

The Secretary for Scotland has appointed Mr. George A. J. Lee to be deputy keeper of the records in Scotland, in place of Mr. Matthew Livingstone, I.S.O., who retires under the age limit.

At the Guildhall, Alderman and Sheriff Sir John Knill has been sworn into the office of Master of the Worshipful Company of Plumbers, and Dr. Robert Crawford, I.L.D., and Mr. Alderman Hind into the offices of Warden and Renter Warden respectively, on re-election for the ensuing year.

A destructive fire broke out on Monday at the premises of Samuel Warburton, joiner and builder, Clifton-street, Miles Platting. The building, a two-story one, with concrete floors, was entirely burnt out, with the exception of the offices adjoining.

At a special meeting of Wolverhampton Town Council on Monday, the decision of the council in committee arranging terms with the Lorain Steel Company for the retention of the system of tramways laid by them in the borough was confirmed. The tramways committee recommended the adoption of this system on the remaining routes in the town, but the report was referred back to the committee.

The memorial-stone was laid on Friday of a new technical school which is being built in Upper George-street, Tyldesley. The school, which will include a gymnasium and library, is estimated to cost £6,000, one-half of which will be provided out of the rates and the remainder by public subscription.

Mr. Moses Dodd, formerly of Lincoln's Inn, and one of the best known agricultural surveyors in England, died last week. The deceased, who was 86 years of age, died from congestion of the lungs. He twice filled the office of Master of the Saddlers' Company, namely, in 1877 and in 1885.

St. Paul's Church, Prince's Park, Liverpool, was reopened on Sunday, after internal decoration. The work has been done by Messrs. G. H. Morton and Son, Ltd., Liverpool, under the direction of Messrs. H. and A. P. Fry, architects. There have also been extensive alterations to the organ.

A bust of the late Mr. Cecil Rhodes, which has been executed in marble at the request of the City Corporation, has reached the Guildhall. It will be placed in a prominent position in the lobby.

The deputy borough surveyor of Swansea, Mr. Walter Bond, has accepted the post of borough engineer and surveyor to the town of East London, South Africa. Mr. Bond was one of five selected out of 105 applicants, and the commencing salary is £800 a year. At present he is in receipt of a salary of £225 a year.

Trade News.

WAGES MOVEMENTS.

SUNDERLAND.—The strike among the Sunderland joiners ended on Saturday, and the men returned to work on Monday morning. The dispute had existed between the house-joiners and the master builders for fourteen weeks. The question was submitted to arbitration, and Mr. A. A. Hudson, the referee appointed by the Board of Trade, awarded that the advance asked for by the men, from 9½d. to 10d. per hour, should not be granted. This award was loyally accepted by the men.

At the instance of the Local Government Board, Mr. H. Rose Hooper, M.A., A.M.Inst.C.E., will hold an inquiry to-day (Friday) at the public offices, Egremont, relative to applications of the Wallasey Urban District Council to borrow £2,070 for the widening and other improvements of Grove-road, Wallasey, £1,510 for works of sewerage, and £590 for the provision of lavatory accommodation in Liscard village at its junction with Sea View-road.

Two stained-glass windows presented to Forsbrook Church as memorials were dedicated on Sunday. The subjects depicted are the Annunciation of the Saviour's birth to the Shepherds, the representation of Christ delivering his discourse concerning the lilies, His welcome to the little children, and His ascension into heaven. The work has been carried out by Messrs. Ward and Hughes (Mr. T. F. Curtis), of Soho, London, W.

Mr. G. J. Edmundson, of Ledbury, has been appointed surveyor to the Stourport Urban District Council.

Mr. J. Mortimer having resigned his position of surveyor and inspector of nuisances to the Tattenhall Urban District Council, Mr. McCarter, at present employed under Preesall Urban District Council, has been appointed.

The new Carnegie gymnasium which is to be erected for St. Andrew's students, and plans for which have been approved of by the University Court, is estimated to cost £3,800.

A special committee meeting relative to the housing of the poor was held on Monday at the town-hall, Newcastle-on-Tyne. A scheme was presented for the housing of the poor on Walker-road, whereby there will be provided 100 two-room houses, and 12 one-room houses, at rents varying from 2s. 6d. to 4s. 6d. per week. The committee decided to bring the proposal before the city council for approval.

Mr. Joseph Brown, builder and contractor, of Hackney, while assisting his men in loading a van with timber at King's Cross goods station on Saturday last, some of it slipped and fell on him. He sustained injuries to his head from which he died.

The work in connection with the rebuilding of the fallen Campanile at Venice has been delayed by the resignation of Signor Beltrami, who was placed at the head of affairs by the Italian Government. Meanwhile, a committee has been formed at Venice to consider the next course to pursue. This committee has been advised to appoint some competent authority on questions regarding the foundations of buildings, and to send him to Rome in order that he may examine the ancient edifices there.

An inquiry was held on Friday by Mr. W. Norton, Local Government Board inspector, relative to the application of the urban district council for sanction to a loan of £17,160 in connection with a scheme for electric lighting.

The thirty-seventh annual convention of the American Institute of Architects will be held in Cleveland, Ohio, the 15th, 16th, and 17th inst. Mr. Theodore N. Ely, of Philadelphia, Mr. Augustus St. Gaudens, Mr. John La Farge, Mr. E. H. Blashfield, and Mr. Austin W. Lord, all well known to the profession, have promised to read papers.

Owing to the neglect of the small expenditure necessary to preserve the ruins, another portion of the roofless east end of Howden parish church fell at the end of last week.

At the last meeting of the Tavistock Urban District Council a report by Mr. J. Chadwick was read, embodying a scheme for the disposal of Tavistock sewage. The cost was estimated at £3,800.

Herr A. Stavenow, general superintendent, Berlin Tramways, and Herr A. Münde, engineer, chairman State Railways, Berlin, were in Glasgow last week to study the Glasgow tramway system. They were particularly interested in the arrangements for the making and repairing of cars at the Coplawh, works of the tramway department, and also in the design of car in use in Glasgow. The tramway system of Berlin is a very large one, the number of motor-cars in use being 1,800, and the number of trailer cars 1,200.

CHIPS.

The Co-operative Hall at Crewe has been reopened this week, after redecoration and repair, carried out by Messrs. Milton and Son, of that town.

The foundation-stone of a nurses' home was laid at Bearwood Hill, Smethwick, on Wednesday week. The home is being erected at the cost of the mayor, Alderman Chalvine, will be three stories in height, and will comprise 14 rooms. Mr. G. Bowden, of Smethwick, is the architect.

A new Welsh Congregational Chapel at Colwyn Bay was opened last week. The chapel is situated in the main street, with sitting accommodation for 600, and has been erected at a cost of £3,000.

A fatal accident occurred on Friday morning at the Savoy Hotel, where rebuilding operations are in progress on the Strand approach. A derrick, which was being employed in lifting an iron girder, collapsed, killing a man named Thomas Harnden and slightly injuring two others named Joseph Flitton and Robert Bleachment. Four men had been told off to hoist an iron girder by means of a hand crane, when the mast broke out of the shoe. One of the workmen managed to jump clear and escaped injury, but the others were thrown from the scaffold, a distance of about 18ft. At the inquest held on Monday, the jury returned a verdict of "Accidental death," and added a rider to the effect that they considered the erection of the crane was improperly supervised.

At the parish church of Woodbridge, East Suffolk, a stained-glass window in the north aisle has been dedicated as a memorial to the Rev. T. W. Meller, rector from 1844 to 1870, and editorial superintendent of the British and Foreign Bible Society. The centre lights have three figures—the principal writers of the Bible—Moses, writer of the law; David, the Psalmist, and Paul, the principal writer of the New Testament. Underneath is a picture of natives of different nationalities receiving the *Verbum Dei*. Some of the types represented here are the Red Indian, the Cree Indian, a Maori, Fijian, and Chinaman. The work was carried out by Messrs. Powell and Co., of Whitefriars.

The citizens of Ballarat, Australia, have decided to erect a statue to the memory of the troops who fought in the South African war. The statue is to be equestrian, in bronze, and the cost will not exceed £1,300 delivered in Melbourne. The pedestal is to be constructed locally. Designs are being received by the Agent-General for Victoria for transmission to the committee.

It is expected that the electrification by the London County Council of the tramway system on the south side of the Thames will be completed before the close of the year, with the exception of the Battersea and Wandsworth routes.

A housing scheme is about to be carried out by the corporation of Newport, Mon., at an estimated cost of £10,000. The site is in Ailesbury-street, and thirty-three buildings, each containing two tenements, will be built.

A special meeting of the Windsor Town Council was held on Monday, when a scheme for the erection of a dust destructor on a piece of waste land outside the borough, at an estimated cost of £6,000, was unanimously adopted, and it was decided to apply to the Local Government Board for permission to borrow the money.

The Belfast Trades Council announced on Monday that Mr. William Walker, secretary of the local Carpenters' Society, will contest North Belfast at the General Election in the Labour interest.

On Saturday afternoon the new hall of the Airdrie Evangelistic Association, erected as a memorial of the late Dr. and Mrs. Wilson and child, who were martyred in China during the persecution of the missionaries, was formally opened. The hall, which is seated for 700 people, has a suite of rooms, including a lesser hall adjoining. The building has been raised by public subscription, the cost being £2,800.

The Queen Victoria Memorial for Nottingham will take the form of a statue, to be erected at the north-west end of the market-place. Mr. Albert Toft, of South Kensington, has been commissioned to execute the work. Queen Victoria is to be represented in white marble in a standing position wearing her crown, and with the sceptre in the right hand and the orb in the left. The figure is to be from 9ft. 6in. to 10ft. in height on a pedestal of polished red granite 15ft. in height. Mr. Toft expects to complete the work by November of next year.

An organ is being placed in the parish church of Longthorpe, near Peterborough. Messrs. Norman and Beard, of Norwich, are the builders.

Brunswick-square, Camberwell, is to be turned into an open space for the use of the public. Half the cost is to be contributed by the London County Council and the remainder by the borough council.

The governors of the Merchant Venturers' Technical College, at Bristol, aided by a grant from the corporation of that city, recently secured for the purposes of equipping new workshops, a building in Rosemary-street, near Broadmead, formerly occupied as a co-operative. For the last few months workmen have been at work making the necessary changes in the building to fit it for new purposes for which it is intended, and these extensions have now been completed.

The new and more direct road between Eastleigh and Bishopstoke, Hants, has just been opened for traffic, and is a great improvement on the old one. The work has been carried out under the superintendence of Mr. Taylor, surveyor to the Hants County Council.

John Oakley and Sons, Ltd., have declared the twenty-first half-yearly dividend on the preference shares at rates of 6 per cent. per annum, less Income-tax, payable on and after Monday, Nov. 2.

The Duchess of Bedford on Saturday afternoon visited Watford, where she opened a new wing added to the district hospital to celebrate the King's Coronation. The new portion of the hospital includes two new wards for six beds each, offices, dental operating-room, and a dark-room for X-rays, the whole being lighted by electricity and heated on the medium-pressure hot-water system. It has cost £1,300.

At Leeds, on Saturday, was laid the foundation-stone of the first permanent parish church begun under a new church extension scheme. The Low Moor Company have presented the site, which is at Beeston Hill, in the suburbs of the city, and the edifice is to be christened the Church of the Holy Spirit. The edifice has been designed by Mr. H. Prothero, of Cheltenham, and the estimated cost is £11,000.

A new public clock has been placed in the parish church tower at Haughley, Mid-Suffolk. The clock, which was dedicated last week, has been supplied and fixed by Messrs. John Smith and Sons, of Midland Works, Derby.

The partnership hitherto subsisting between G. M. E. L. Verlyck and E. T. Dunn, architects and surveyors, Ilford, Essex, under the style of Verlyck and Dunn, has been dissolved.

In a museum attached to two almshouses at Kirk-leatham, near Redcar, erected in 1676 by Sir William Turner, Knight, Lord Mayor of London, is a carving of St. George and the Dragon out of a single block of boxwood, the work of a poor prisoner. It is valued at £2,000. It is said that this piece of carving was the cause of a wager being once laid in a dispute as to its entirety. To prove that the work was one single piece of carving it was plunged into a pot of boiling oil and allowed to remain for hours. All doubts were set at rest when it was withdrawn and found to be still complete. The prisoner who completed this marvellous piece of work used no ordinary penknife only.

New co-operative stores at Deckham, near Sheriff Hill, was opened on Friday. Mr. Edwin Bowman, of Newcastle, is the architect, and the contractors are Messrs. Raven and Hitcham, of Gateshead.

LIST OF COMPETITIONS OPEN.

Saltwood, Elham—Sewage-Disposal Scheme	3'gs.	R. Lonergan, Clerk, 11, Cheriton-place, Folkestone	Oct. 7
Rawtenstall—Free Library and Town Hall (Assessor)	£100, £50, £30	A. W. Lawson, A.M.I.C.E., Boro' Surveyor, Rawtenstall	" 12
Harrogate—Pump-Room and Colonnade in Valley Gardens		F. Bagshaw, Borough Engineer, Municipal Offices, Harrogate	" 26
Sunderland—Additions to Town Hall	£100, £50, £25	John W. Moncur, A.M.I.C.E., Borough Engineer, Sunderland	Nov. 21
Wakefield—Reconstructing Cattle Market	50'gs. (merged), 25'gs.	R. Ernest Langhorne, Solicitor, Wakefield	Dec. 1
Vienna—Machinery to Lift Boats	100,000, 75,000, and 50,000 kronen	The Austro-Hungarian Consulate-General, 22, Laurence-Pontney-lane, E.C.	(1904) Mar. 31
Glasgow—Branch Library for Parkhead District		Sir J. D. Marwick, Town Clerk, City Chambers, Glasgow	—
Liverpool—Cotton Exchange (Local Architects)		Peter Brown, Sec., 5, Brown's Buildings, Liverpool	—

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2544.

FRIDAY, OCTOBER 9, 1903.

MODERN ARCHITECTURAL PROBLEMS.

ALTERED circumstances have considerably changed architecture and the profession. It is now more a question of erecting buildings for shelter, business, or occupation, and of designing façades to them, than of practising the art from a love of it. The fervour of the early revivalists has died away. Strawberry Hills, Fonthill Abbeys, Castles and Medieval churches are no longer erected with the enthusiasm which once prompted their builders. In our towns at least everything is essentially practical and prosaic; it is the use of the building, not its appearance, that is regarded. Questions of light and air, ample accommodation—which can only be secured by lofty building in our dense towns—are uppermost. We do not now discuss municipal regulations and building by-laws which restrict the architect in his work, but confine our attention to questions of design and construction, such as those imposed by density of area in towns, light obstruction, change of environment, new requirements of trade or occupation. A great variety of circumstances concur to render the problem of design in these days very difficult. A building which did very well fifty years ago for a city warehouse is quite out of place now; its windows are probably too small to admit sufficient light amidst lofty structures of the same class, its floors incapable of bearing the load and vibration of new methods of storage and transit, or the wear and tear of machinery. The bank or insurance office of that time would also be out of date in many of its appointments and equipments. Situated between lofty premises and surrounded by inflammable goods, its risks would be considerably heavier than when it was built. Its windows would be largely obscured by opposite or rear premises; the equipment of the interior would be inadequate for modern use. Even its architectural design is out of date, for all the careful study and detail of façade in its upper parts are obscured by the premises on either side, which are larger or more ostentatious, and throw out of scale the details of the older building. The difficulty of meeting the changed condition of modern life with forms stereotyped 300 years ago, which has been charged by many people against the Church of England, applies with equal force to our national architecture, which has shown a reluctance to break through traditional forms of building. Even now many of our best architects do not scruple in casing a warehouse constructed of steel columns and girders with red brick walls pierced by square windows of the Georgian era, with sash frames and small squares of glass to match, and with copying the charmingly quiet and reserved shop-front windows which used to line our pavements a hundred years ago. Of course, there is a certain sentiment in all this; but it goes to prove that in art, as in other things, we possess the desire to follow old forms rather than those which express the real condition of structure. In the other direction we clothe the same skeleton structure of iron and steel with the most ornate and elaborate Renaissance exteriors, indicating the opposite extreme of expression. In one case we have an almost puritanical reserve, in the other a display of architectural detail quite in the contrary direction. This is an anomaly unknown to all preceding periods;

but it represents the opposite extremes of life and taste in building. We cannot explain it in any other way. There are people who like reserve and restraint, others who prefer license and display. Both kinds of architecture are, however, stereotyped forms, which have nothing to do with structure; in fact, they both misrepresent it under modern conditions. It is one of the problems of the architect to discover a more consistent expression if he can. It may be we have no other style to offer in substitution, though they very ill express structures of the kind we have mentioned. From what we have said it is clear that design has not grown with the actual building conditions, and the external architecture is often at variance with the structure within. The structural necessities of modern building, the use of steel and fireproof floors and materials, cannot be made to yield: they will rather develop with the requirements of trade and industry, so that the difficulty of reconciling the two things will increase rather than diminish.

Let us look at a few of the points which distinguish the modern from the old. In our crowded towns there is the absolute necessity of increasing the height of our buildings, and this entails a certain loss of light, and consequent variation of our street elevations. For one thing, larger window openings are required, and the projecting features, like cornices and string-courses, must be reduced as much as possible. Here we have two variations in the design of our buildings, which we cannot overlook. Neither of them is indifferent. Each should be recognised in our crowded street architecture. Large or more numerous windows must be provided in the narrower streets, especially in commercial or office buildings, where light is of first importance, and horizontal projections must be minimised at the cost of architectural effect; the latter has been done in not a few of our recent street premises. We notice this feature in a few new buildings in the Strand—the façade of the Cecil Hotel and the chief front of the new Gaiety Theatre may be named. The cornice of the latter over the open colonnade or loggia is proportioned to the columns, and not to the whole height of façade. A flatness of effect may sometimes result from cutting down all projecting courses. To compensate for this, the architect may have recourse to breaking up his front vertically by recessing the windows or inseting them, as is very well done in the new terracotta offices at the corner of Fetter-lane, where bays with flat-canted sides are inset in the wall. The cornice and other features are kept flat.

The result of the first of these innovations—the widened window—is to reduce the wall in area, to gather it up into piers, and to form wide window bays, a mode of construction which is very generally adopted in warehouses, factories, and other premises of a commercial kind. The walls being concentrated into piers, these must naturally be made thicker. We may call such a mode of construction the Pier or Pilaster style. It lends itself well to iron or steel stanchion construction and girders. Stanchions cased in terracotta, or stone, or granite can be carried up several stories, as in the American "skyscraper," while the horizontal or floor connections would be set back from the pilasters, and would be made to look ornamental if desired. A cornice of small projection can be carried along the top or broken round each pier, and there may be a high or low roof. This is one of the modes open to the profession to work out. But the idea of a broad wall surface is dear to the architect; he likes the spaces between and above the windows to be wide, and for the window openings to appear what they are in a wall, so he prefers, with all its faults, the "hole-in-the-wall" style of sixty to a hundred years ago. The wall spaces between the

windows vertically can be made ornamental, panelled, or be set off with deep stone, cut keystones, and gauged niches. The second innovation we have mentioned, the reduction of all projections, may be found to work out more satisfactorily with piers than with flat wall surfaces. We almost dread to contemplate the appalling bareness of walls of great width and height without cornices or projections, only pierced by windows, which we occasionally meet with. The one chief good about it is that it is honest; it proclaims what it is—an unbroken wall of brick with a few light apertures, masterful and "overwhelming with the impressiveness of silence." Each of these methods of building has its advantages—the first gives the largest amount of light, the second affords the greater protection to opposite premises in case of an outbreak of fire, and in narrow city lanes and passages this is an obvious merit. Breadth of surface also is better for wall decoration. The point of most importance to decide, however is light. The necessity of greater altitude or number of stories involves also an encroachment on the right of light of opposite neighbours. Here the Law of Light steps in: it will not permit the building owner of the dominant tenement to raise his premises a height that will unduly obstruct the light of his neighbour, and if the reform in the Law of Light is passed, the dominant owner will be entitled to such an amount of light passing over the servient tenement as necessary for comfortable use and enjoyment of the dominant tenement, but he is not to be entitled to any extraordinary amount of light necessary for any particular trade or occupation. Such a restriction necessarily limits the height of buildings in certain circumstances, though what these are has not been made clear from the legal decisions. We know that in London alone the question is becoming a difficult one. In many parts buildings are erected on each side of narrow passages which seriously interfere with the light of opposite premises, but there is no law to touch them. The County Council is the only authority who can interfere. The problem is not confined to building; it concerns the architectural treatment of these structures. Should they be perfectly plain, or not? Common sense dictates that plain treatments are desirable, as any ornament is thrown away, and cannot be seen—at least in the upper part. The architect is at least wise if he confines his detail to the lower portion or story. If it is a shop or warehouse he may introduce a thoughtful and judicious treatment of his windows, which should be flat or only slightly curved in plan, as in many of the older shops. He may just give those touches of detail and ornament to his cornice and entrances which can be seen and appreciated by the passer-by; but the rest of his façade he may well leave alone, as no one can strain his neck to look up. If the building is very lofty, and peers above the surrounding premises, the upper story may be designed with special reference to being seen above the roof; the treatment can be made architectural and the profile studied, ever remembering it has to be seen from afar, not from the street below. But besides light and treatment of the fronts of such buildings, their protection against fire ought ever to be present in the mind of the architect, and this is another problem that has to be faced. The building regulations are supposed to look after this. If the party-walls are built and other details of the Act are complied with as to areas, &c., it is thought all is done that is needful. But we consider the planning and construction of our large commercial houses and establishments, retail as well as wholesale, are by no means what they ought to be. As lately pointed out in our columns, these regulations are very inadequate; they leave many of our smaller shop premises totally unprotected

internally, and anyone can escape the law by making his building a foot or so under the prescribed 250,000c.ft., and then as to exits and means of escape they are unprovided. Proprietors and customers have to be catered for, as well as the safety of those employed and the public.

The requirements are often contradictory. The owner and his customer want large, unimpeded floors for the display of goods and for showrooms, and they want commodious lifts in the centre; but those engaged on the premises or in workrooms, and who have to risk their lives in the upper stories, require provisions to be made that will secure their safety when a fire breaks out; a lift or an open staircase in the centre is the greatest danger of all. A large amount of floor-space is also a risk, and the fittings necessary for a good display of goods add to the combustible materials. The requirements against the spread of fire necessitate, of course, a limit to be placed on large floors and the storage of material, and the division of the building into fire risks or compartments that can be closed in case of an outbreak with fire-resisting doors, so as to localise any fire. These are well-understood precautions, and theoretically the conditions necessary to prevent the spread of fire and to secure the safety of the inmates are well known; but we have not seen any practical solution. If our buildings are constructed of fire-resisting materials, they are faulty in other respects. Of what use are fire-resisting floors if these are penetrated by a lift or staircase without means of protection, or if the exits from the building are in the wrong place? Then fire may break out in one building and communicate across a narrow street with another, if there are no means of effectually closing all the windows. Experts have, on paper, made it clear how to localise a fire and confine it within a manageable space; they have shown how the windows and openings can be protected, and the means of escape provided. The solution, in fact, has been attempted. One good scheme, laid down by Mr. Ellis Marsland, consists of dividing the building into compartments. Light is provided through a large lantern in the roof, lighting the various floors. Several large staircases are provided from ground floor to roof, with an elevator to each. The door openings in the compartment walls are placed in a direct line with the exits into the streets. A fire occurring in one compartment, the customer could pass through the doorways, and could make his exit in either direction. There would be nothing in the building to burn except the contents of each floor, and the well and lantern would act as a chimney for the escape of smoke. Now the compartmental mode of building by division walls would favour architectural effect. It would enable the architect to divide his long floors and rooms and corridors by walls or columns into a suite of apartments, and greater variety would be obtainable. The external staircase and lift could be turned into distinctly architectural features or towers at the ends or angles of the building, and the lantern and flat roof could also be made pleasing. All these things had no existence half a century ago—that is to say, they did not trouble the architect in his design of a building. Now they exercise a great deal of influence, and architectural design is no longer a question of the employment of the Five Orders, or the adaptation of a style simply, but it has to take into account modes of construction that are often detrimental to artistic efforts.

Planning and design do not entirely exhaust the subject. The many novel methods of construction and the use of new materials have led to a revision of the older forms and types. Take, as an instance, the introduction of "reinforced" or steel concrete. For engineering purposes, for subways and sewers, arches and bridge construction, and floors re-

inforced concrete has been largely used, and it is gradually being used in the construction of buildings, in pier and floor construction, staircases, balconies, towers, and other features. And the armoured concrete has largely supplanted brick and stone work, and other materials, like iron and timber construction. The architect who desires to bring it into use must acquaint himself with the best methods of construction, the proper position of the bars and rods of steel which have to take the tensile stresses, and the thickness of concrete. The ferro-concrete of the Hennebique system appears to be well suited for solid floor and staircase construction. It has certainly a rather bulky appearance; but the architect may, by moulding the edges of the lower beams, take away any heaviness of appearance. We have seen the system used for a large warehouse floor, in which deep cross-beams divide the floor into bays or squares of about 10ft. These beams support the floor slabs, which are continuous, and of about 4in. thick. The floor was heavily loaded, and the deflection small. The beams are reinforced by rods 1½in. diameter. One or two of these are bent, and the others straight, supported by stirrups at intervals, which take the shearing. The stress on the concrete is supposed to be uniform in all the compressed parts, and the forces in compression are in moment equal to those in tension taken by the rods. According to the inventor, the concrete does not take any tensile stress. Floors of this construction have carried considerable loads. We do not here enter into the theory of floors of this kind; but if the tensile and compressive forces are equal, the assumption is that the concrete and steel reinforcement are perfectly balanced. This plan of reinforced concrete is applied to columns and supports as well as floors; it can be used for arches and vaults. For concrete arches the steel armature is carried well into the abutments, and an armature is also carried along the extrados as well, to resist the tensile stress at the point of rupture. Thus, a double armature is used. To apply this system of reinforced concrete for architectural purposes, it becomes necessary to ascertain the stresses to which the structure is exposed, so that the steel rods or bars may be introduced where desirable. As the steel armatures are incased with concrete, a considerable latitude is allowed to the architect to mould the mass into any desirable shape. Ordinary iron and steel construction does not permit of this freedom; the beams and stanchions or pillars have to be designed with special reference to the stresses, and in the most economical manner, so as to economise material and weight. Thus a steel beam cannot be made deeper or wider to satisfy the appearance than the formula prescribes without adding to the load its own weight, and this is a wasteful mode of using the material. These and other problems will occur to the architect in his designs for new structures which call for a thoughtful investigation.

"PUBLIC BUILDING"—THE STATUTORY DEFINITION.

AMONG the many arguments that may be used to prove the inadequate provisions and defects of the London Building Acts and the need of securing their amendment, the frequent questions that arise as to the meaning intended to be conveyed by certain definitions of the Act are prominent. The terms "party-wall," "party-structure," "topmost story," and others have been often before the Metropolitan magistrates, and our readers may remember decisions which leave much to be desired, both in the magistrate's decision and the framing of the Act itself. Take as an instance the meaning of the expression "public building." Edifices of

this class are sufficiently numerous as to require a rather wide definition, as it must comprehend all buildings constructed or adapted to be used for any public purpose. Every structure that is built for the assembly of people for any purpose, such as a church, chapel, public hall, theatre, ball-room, lecture-room, museum, or library, must come within the term; also any used, or adapted to be used, for any other public purpose, like an hotel, lodging-house, refuge, &c.; but a line must be drawn between such buildings, and those in which persons are received for special purposes. But the term has been extended to include almost any kind of building used as a sort of hospital. The definition runs as follows: "Public building" means a building used or constructed or adapted to be used as a church, chapel, or other place of public worship, or as a school, college, or place of instruction (not being merely a dwelling-house so used), or as a hospital, workhouse, public theatre, public hall, public concert-room, public ballroom, public lecture-room, public library, or public exhibition-room, or as a public place of assembly, or used or constructed to be used for any other public purpose, also a building used or constructed or adapted to be used as an hotel, lodging-house, refuge, or shelter, where such building extends to more than 250,000c.ft., or has sleeping accommodation for more than one hundred persons." This definition is intended to include all kinds of buildings other than dwelling-houses; but in trying to extend its meaning to a variety of structures that are used as houses or hospitals, technical points have naturally been raised by those who desire to evade the regulations. Too much has been attempted in the last amendment of the Act, especially in the addition of the last clause, which includes hotels, lodging-houses, refuges, and shelters exceeding the cubic space mentioned. An interesting appeal case came before Mr. Justice Bruce and Mr. Justice Phillimore a year or two ago. The question arose on a special case stated by a Metropolitan police magistrate to review his ruling on an appeal against the objections of a district surveyor. The Metropolitan Asylums District managers, under a Local Government Board order, have the care of children who, from defect of intellect or physical infirmity, cannot be trained in ordinary schools. The managers purchased dwelling-houses for the purpose of lodging these children. Plans were submitted for alterations to fit the houses for the purpose, and the building had a cubic capacity of 50,000ft. These were submitted first as plans for a public building; but when the requirements of the district surveyor were made, the managers argued that the building was not "public." The magistrate, however, contended that the building was in the hands of the Metropolitan Asylums managers, "used or constructed or adapted to be used for a public purpose," and made the order asked for by the respondent. It was contended for the respondent that the building was *ejusdem generis* with a hospital, and therefore came within the term used, &c., for any other public purpose. For the appellant "Josolyne v. Meeson" was cited. The appeal was allowed. Mr. Justice Bruce said the building in question was not a public building within section 5 (27) of the London Building Act, and he disagreed with the contention that it was a hospital. The building could not be considered as a hospital for the treatment of the sick or infirm. Nor was the building within the section on the ground that it was a building used for "any other public purpose." The substance of the decision cited was that the phrase "public purpose" indicated not a place in which the public had an interest, but one where the could gain admission. Apart from that, building "used for any other public purpose" must be one used for a purpose *ejusdem generis* with those of the enumerated buildings, an

would not include a house used for the purpose described in the case. "The building did not come within the term 'home' because it had not a cubical capacity of 250,000c.ft. or sleeping accommodation for 100 persons." The other judge came to the same opinion—that the building was not a hospital in the modern sense of a place for treating physical ailments. He said: "The Local Government Board and the Metropolitan Asylums Board had anticipated the provision of the Elementary Education (Defective and Epileptic Children) Act, 1899, and had provided houses for the reception of children who were incapable of being associated for the purpose of education with ordinary children, as an adjunct to schools where special arrangements were made for the education of such children. The children placed in these houses were there for the purpose of education, and not for treatment. The houses were, therefore, in no sense hospitals." He was also of opinion that the building "did not come within the words 'buildings used, &c., for any other public purpose.' These were not, perhaps, the best words to have employed; but they were the words which were used in the former Act, and as they had received judicial interpretation in *Josolyne v. Meeson*, they were introduced into the Act under consideration. The words did not include every building used in the public interest, but only buildings used for the purpose which involved the admission of the public—as, for instance, a public lecture-hall, where every member of the public who paid the entrance money was admitted." He was therefore of opinion the building did not come within the term of section, and the magistrate's decision was wrong.

Reading between the lines, we have little doubt the framers of the Act, especially those who revised the definition of the Act of 1894, intended that all such buildings as that erected by the managers under the Local Government Board were to be included within the terms of the section, as the last clause of it we have quoted appears to show; but by adopting the capacity of 250,000 cubic feet, or a sleeping accommodation of 100 persons, they excluded all buildings below these limits, so that such prescription as to size destroyed the general intention of the section to all except those who exceeded it. This decision has at least proved that buildings of the kind noticed cannot come within the term "hospital," which is now used as a place for the treatment of the sick or infirm, and cannot be extended to buildings used for teaching those who are mentally afflicted; nor can the term be applied to every building used in the public interest, but only those which involved the admission of the public.

The distinction is certainly a rather nice one, and we can very well imagine another tribunal reversing the decision if it were possible. As it is, it is a good example of the double meaning that can be attached to the statutory definitions of the Act. The extension of the limits of the term "public building" to include a variety of structures of a semi-public character, such as hospitals, lodging-houses, schools, homes, and refuges has been a source of weakness, and has encouraged building promoters to find excuses for denying the term "public" as applied to certain buildings. The definition would have been more exact if it had stopped at those buildings which are largely used by the public, such as churches, public halls, lecture-halls, and theatres, and had made other provisions not so exacting for the other kinds of buildings named. The idea of those who framed the Act appears to have been to comprise under the term "public building" all other kinds of structure that are not dwelling-houses or domestic buildings. Thus, the expression "domestic building" is defined as including "dwelling-houses and any other building not

being a public building or of the warehouse class." So that if the expression "public building" had defined it as including any other building not being a domestic building or a warehouse, the definition would have been much clearer than it is. By naming a number of buildings for different uses, the definition has been deprived of its real object and exactitude; and the conclusion is that one "used for any other public purpose" must be intended for a purpose *ejusdem generis* with those enumerated. If the words subjoined in parenthesis to school, college, or place of instruction—viz., "not being merely a dwelling-house so used" had been omitted, the decision might have been other than it is. These parenthetical words certainly exclude alterations to a house to fit it for the scheme intended. Many dwelling-houses are converted into lodging-houses, homes, hotels, and schools by removing party-walls and partitions, to which it would be unduly extending the term "public building." The chief concern for such altered structures is the safety of the inmates in case of fire; and this could be insured by enacting that the interior is not to exceed the 250,000c.ft. without the necessity of labelling them "public buildings." The area or cubic capacity of a building has nothing whatever to do with making it public, as the definition appears to imply. Section 79 speaks of the conversion of houses, &c., into public buildings, but does not define the meaning to be attached to the word "public." Of course, the definition we have quoted above is intended; and this comprehends, as we have seen, a number of purposes which can hardly be called public. The section, at any rate, is far from being conclusive. So many domestic buildings are converted, as we have said, into schools, hotels, lodging-houses, and other purposes which can scarcely come under the term. We could refer to other sections of the Act which are equally ambiguous, and are constantly being called into question. These are questions which call for revision at the earliest opportunity. A building phrase or term used in an Act ought to be as correct and exact as we can make it, and avoid all equivocal words and expressions that can be made an excuse for any disagreement. As far as possible, it should not cover too much ground by including other conditions of building, but be made as exclusive as possible. Thus every set of conditions ought to have its own special provisions, rendering it impossible for the cantankerous disputant to attach any other reading to the section. Applying these obvious principles, many of the sections of the Metropolitan Building Act may be found unsatisfactory and often defective.

THE ARCHITECTURAL ASSOCIATION.

THE inaugural meeting of the fifty-seventh session of the Architectural Association was held at the Institute of Architects' rooms, 9, Conduit-street, W., on Friday evening, and attracted a large attendance of members, including Mr. Aston Webb, R.A., P.R.I.B.A., Past President. The chair was occupied by Mr. Henry T. Hare, the President, who received a cordial greeting on taking his seat. Fifty-four nominations to membership were read, and Mr. Arthur Keen was elected as a member by acclamation, and Messrs. L. Sage, C. Granville Baker, and W. J. Waghorne were reinstated in membership. The President proposed the election as an honorary member of Mr. T. Sudsuki, mentioning that this gentleman had been sent by the Japanese Government to study the educational methods of architectural bodies in England. At a later period Mr. Sudsuki was also commissioned to visit various Continental countries for similar investigations, his entire tour being intended to extend over four years. The motion was carried by acclamation, and Mr. Sudsuki suitably acknowledged the compliment in idiomatic English, expressed with some deliberation. The President announced that, in consequence of the appointment of Mr.

H. P. G. Maule as master of the A.A. day school, a vacancy had arisen in the honorary secretaryship. To fill this Mr. Louis Ambler would be proposed by the committee at the next meeting, and in Mr. Ambler's stead on the committee Mr. G. B. Carvill would be nominated. A vote of thanks was accorded to the Bath Stone Firms for arranging a visit to the quarries and for entertaining the members last week; a similar vote was accorded to Mr. Mowbray A. Green for organising and conducting a series of visits on that occasion to buildings of interest in the city of Bath.

The studentships and prizes gained during the last session by members of the day school and evening classes were then distributed by the President. The prize designs were reviewed, and the list of awards published in our issue of June 26 last, p. 883 last volume.

The President then delivered the following

OPENING ADDRESS.

When we met together in this room a year ago you may remember, Mr. Hare remarked, that I expressed the hope that I should shortly be in a position to make an announcement that the pressing question of our new premises has at last reached a solution, after having constantly occupied the attention of your committee for many years. Session after session allusion has been made to the subject in the Presidential Address, and it may well be that your patience and hope have become well-nigh exhausted. The anticipation is, however, now happily fulfilled, and after long negotiations we have been able to take possession of the Royal Architectural Museum, for so many years located in Tufton-street, Westminster, and formerly housed at the then Brompton Museum. This fortuitous consummation being reached, your committee forthwith proceeded to the consideration of many proposals for the adaptation of the premises to our needs: were able to instruct their architect, Mr. Leonard Stokes, one of our past-presidents, to proceed without delay with the work; and to accept the estimate of Messrs. Holloway Brothers. To-day substantial progress has been made, and there is no doubt we shall be able to move into our new home at the end of March next. I have no intention of wearying your patience with the long and deeply-interesting history of the

ROYAL ARCHITECTURAL MUSEUM,

that has already been written in part; and now, no doubt, the time is at hand when an authentic and detailed account of its origin and progress will become an obligation posterity may demand. It will be enough to say that it has had a long and brilliant past, and that it is a tangible evidence of the potency of the Gothic Revival. Some may here be led to remark that that cult had become effete; that the institution had fallen upon evil days and was passing away in senile decay. If such were the case, it is but a surface truth, which accomplished events have abundantly disproved. True! the museum had become out of sympathy with its environment through the trend and evolution of architectural progress, in which it had held such a pre-eminent position, and exerted such a widespread influence. It is the fashion, in looking back on the Gothic Revival, to speak slightly of the enthusiasm which possessed its leaders, or to regard that enthusiasm as worthy of a better object. The direct effect, however, is with us to-day in our emancipation from the artistic paralysis of the first half of the last century. The leaven is still working, with full and perhaps increasing potency, and the wonderful Renaissance is yet only emerging from its shell, and there is promise of such glorious developments as may perhaps eclipse the greatest triumphs of the past. Beneath the apparent desolation of the museum was a latent vigour, based upon our indigenous architectural traditions destined to successfully receive the graftings of such a vigorous constitution as that of the Architectural Association, whereby to renew its strength, and with regenerated powers to influence for lasting good our noble profession. This sketch is not overdrawn, and while we are accepting new responsibilities, we are also investing ourselves with a heritage in delightful associations and replete with potent possibilities. The interests centred at Tufton-street are one thing; the collections are another, and without going further into that it may be said that the study and contemplation of the contents of the museum and of the cognate studies there represented have had no small part in the great Renaissance to which I have just referred. It will be

impossible to adequately refer to the long roll of honourable names linked with the history of the museum, but I cannot refrain from reminding you that among those in the past have been H.R.H. the late Prince Consort, Earl de Grey, Ruskin, Donaldson, Sir Charles Barry, Beresford Hope, Scott, Cockerell, Penrose, Pearson, Brandon, and a host of others; while in the living present we have Mr. John P. Seddon, Mr. Aston Webb, Sir William Emerson, and Mr. Maurice B. Adams, who for so many years has acted as honorary secretary, and through whose enthusiastic interest the idea of fusion has been translated into a reality. These are names which will be for ever connected with the Royal Architectural Museum. We see to-day noble blocks of Government buildings rising in Whitehall, which strangely seem to recall to memory the hot controversies and battle cries of the styles which raged when the Foreign Office designs were prepared by Sir Gilbert Scott in a manner alien to his sympathies. In all of this, no doubt, Tufton-street exercised a not unimportant influence. Scott is generally supposed to have vindicated in St. Pancras Station what he would have done in Whitehall had he been so permitted by the powers that then were. In those days the Museum was a centre of light and leading, and I trust that it may still be in a more extended way a factor to be reckoned with in the architectural movements and interests of the day.

THE DAY SCHOOL.

The past year has not only been significant and epoch-making by what may be designated as the great departure, but it has been rendered notable by the successful completion of the first year's working of the day school. This is a matter for sincere congratulation, and this fact is important enough in itself to have taken precedence of everything else. However, these two events have come together side by side: the school demonstrating beyond all dispute the inadequacy of our present premises. This climax may well encourage us in the highest anticipations for the future progress of our society under the more favourable conditions which we shall enjoy in our new home. After two years of ungrudging labour Mr. Arthur T. Bolton has, greatly to everyone's regret, relinquished the post of head master of the day school, which he has filled with unqualified distinction, and the success which has attended the school is doubtless due in a very large measure to his devotion. To undertake a mastership is one thing, to organise and originate is another. Mr. Bolton has done both. Our ideal has been to give definite and systematic instruction by a one year's course of training preliminary to office work, and, when desired, to supplement this by a second year's course of more advanced study. This instruction is partly intended to enable the student to gauge in a measure before life is too far advanced his capacity, and to test practically his inclination for entering the profession. The latter consideration need not be present, but had it been possible for many now alas! in practice, perhaps some careers would have been happier and architectural reputes more unsullied. The instruction which our day students receive at the hands of the master and his assistants is based on principles which are intended to enable an intelligent interest to be taken in what they will see going on around them when they enter an office, and to assist them to assimilate the knowledge which will be at their disposal if they can but seize their opportunities. Some of us can recall happy days of long ago, when enthusiasm was high, and zeal, often misdirected, outran knowledge. This spirit Mr. Bolton has been able to foster, and to direct to sources of wise inspiration. I cannot do better than invite you to inspect the results evidenced by their work, and to come and see the schools in operation for yourselves. The progress so far has been most gratifying, and we shall watch with signal interest the subsequent careers of those students who have had the good fortune to pass through the school. This success is all the more remarkable as having been attained under the very difficult restrictions which the present premises imposed upon us. When we enter upon our new home next year, we shall confidently expect to see corresponding developments. To fill the vacant mastership has been a difficult and anxious duty. I am certain that the selection of Mr. Maule has the full approval of the Association. The responsibilities of the post are by no means light, and whatever the new master's opinion of his own fitness may be, all will agree that no better choice could have been made. In connection

with these two topics, before leaving them I have two appeals to make.

PUPILS WANTED FOR THE DAY SCHOOL.

First in regard to the day school, I take this public opportunity of commending it to the consideration of parents, guardians, and heads of public schools, as affording an excellent means of testing the aptitude of the coming man for his future profession. Should experience show within twelve months that he is unsuited for the calling of an architect, he will have been no loser thereby, but will have gained much information useful in other walks of life, and will have been spared the drudgery of an uncongenial occupation. The other appeal I have to make is to a wider audience than that represented within this room. I refer to

THE BUILDING FUND.

which still requires to be largely augmented before we can hope to be free from debt. The work on which we are embarked at Tufton-street is one which is in the interests of every member of our profession; indeed, I do not think I am guilty of exaggeration if I say that it is of national importance. In every other great country it would be undertaken or heavily subsidised by the responsible government; here, however, it is left to private effort, and the greater need there is therefore for every member of the Association and the profession at large to afford the utmost support which their means will allow. The Association numbers nearly fifteen hundred members, and one might reasonably expect that each one of these would contribute to an object which is so much in their interest. Up to the present time, however (although we have to thank many generous donors), less than one quarter of our members have responded to the appeal. I feel that some great effort should be made to bring the general body into line, and I here invite every member to follow the example already set by your committee, by doubling the amount of his yearly subscription for this session only. This should be within the means of all, and produce a community of interest, which would be for the good of all. The provincial societies have also an interest in this matter, and very welcome have been the contributions sent by some. I commend the good work heartily to the others, and indeed to all persons interested in the progress and advancement of architecture (and who should not be?) as a national British art, and ask them to show their practical sympathy by coming forward to assist us to complete the provision of the large sum necessary for the adaptation and enlargement of the Royal Architectural Museum to the purposes of the Association. We have had to undertake certain financial responsibilities relative to and contingent on the acquisition of the property and its extension, while in addition to this there will be considerable outlay in the rearrangement and exhibition of the valuable collection of casts, which will be open free to the public as heretofore. In regard to the latter we hope to make the collection as far as possible representative, chronological, and useful in every way to students at large. Many have laboured for the Association in the past and given ungrudgingly of their time and means. We to-day may enter into their labours and continue them. I feel sure I shall not appeal in vain, and that the provision of these highest and indispensable facilities will not be left to become a burden to the Association, and a drag upon its work and progress.

TWO GREAT LOSSES BY DEATH.

Death is ever too busy about us, and to-day we have to lament the loss of some valued colleagues whose sympathy and counsel have helped us in the past. The late Mr. F. C. Penrose was associated with the early days of the excursion under Edmund Sharpe. We also deplore the loss of Professor Roger Smith, twice President of this Association, ever its kind adviser, and the friend and learned instructor of all young men brought under his helpful influence.

A WORD TO STUDENTS.

In drawing to a conclusion, I have a few reflections which I wish to offer to our student members. I might again advise the enthusiastic pursuit of the study and delineation of ancient buildings, or the fruitful results that await the diligent student of architectural literature, without enlarging on either, which I have done before. I would again heartily commend both to you. What I want to do is to venture to suggest the deliberate consideration of such studies as are

the outcome of demonstration and experience, observation and research, rather than the perusal of books and the abstract theories of mankind. Sir Norman Lockyer, in his illuminating address before the British Association, made this pregnant statement: "From neglect of research comes imperfect education, and a small output of new applications and new knowledge to reinvigorate our industries." It seems to me that much of the deplorable wickedness which we unfortunately see abounding in the thoroughfares of our cities and towns is the result of (to put it in better words than mine), "old rule of thumb processes, which are preferred to new developments"—a conservatism too often resulting from the master's own lack of knowledge. This may seem a hard saying, but it should be our object, as much as lies within our circumscribed and limited powers, to develop and foster the abilities with which we are all more or less endowed. It is no crime to be young, and all possibilities lie with youth, so that in a way it may be said that to be young is to be successful. To secure our well-being as a profession it is highly important to see to our organisation and equipment, the consideration of which is to us personally as important as the provision of "battleships and big battalions." It is brain, therefore, that we want, fortified by the experience and research of others, and it is the practical personal study of the design and execution of modern work by modern masters, reinforced by the rich heritage of art which has come down to us. It has been recently said, "It is a great thing to learn to use other people's experience, and to get it first hand, not trusting entirely to books. Knowledge obtained from men is the most mentally nourishing and the most easily assimilated." What I would leave with you is the picture sketched by Robert Browning:—

Here work enough to watch
The master's work, and catch
Hints of the proper craft, tricks of the tool's true play.

Mr. G. H. FELLOWES PRYNNE, Past President, in proposing a vote of thanks to the President, expressed his great regret that Mr. W. H. Seth-Smith, who had taken so keen an interest in architectural education, was prevented by ill-health, partly due to overwork, to be present. The President had established two records that evening. The first was to make the welcome and long-deferred statement as to the new premises, a phantom that had eluded every previous occupant of that chair. The second was to have read the briefest address yet given, and yet one which was as full of suggestion as it was concise. The work to which the Association had set its hand was progressing with great energy, and the zeal and application of Mr. W. B. G. Lewis, and the staff of lecturers, at 56, Great Marlborough-street, had inspired the students to go forward. The day classes had been largely originated by Mr. Seth-Smith; but the contemplated removal to Tufton-street was in great part due to the present President.

Mr. J. SIVENRIGHT GIBSON, in a speech marked by dry humour, seconded the motion, observing that it was wonderful to outsiders that presidents of architectural bodies should find something fresh to say in each annual address, and still more wonderful that they should always find full audiences to listen to their advice and suggestions. Unfortunately, the general public did not now take the keen interest in architectural questions that they did when the "battle of the styles" was being fought with such vigour, and when A. W. Pugin was publishing his "Contrasts," so full of fun and strength.

Viscount HAYASHI, the Japanese Minister, who was cordially received, in supporting the motion, observed that Japanese architects had beside the ordinary problems of architectural work a great difficulty to encounter in the form of making provision for the stability of buildings which were subjected to frequent shocks of earthquake—a difficulty which did not need to be taken into consideration by most of their confrères in other lands. Many tourists to Japan had, however, formed an erroneous impression regarding Japanese buildings. They had written and spoken of the houses as tent-like structures, supported with posts pasted over with paper to serve as walls, which might lead to the inference that it only required a shower of rain in summer or a snowstorm in winter to reduce such flimsy structures to total wrecks. That such statements were not exactly true was proved by the fact that most of the houses were old buildings of substantial character, being as much as four stories high.

Some of the pagodas rose to a height of from 150 to 200ft., and there were pagodas in Tokio 650 and even 1,200 years old.

Mr. ARNOLD MITCHELL remarked that Mr. Hare's position in that chair and in his profession was a fresh proof that the only road to success was sheer downright hard work, and the inception of the new premises was largely due to his energy. The value of the Association schools and classes would, he believed, be evident in the work of the architects of the future.

Mr. HENRY LOVEGROVE and Professor BERESFORD PIERCE also supported the vote of thanks. The latter remarked that these annual addresses served a useful purpose if they induced architects to look before and beyond, and to take stock of their personal standing. Ordinary papers dealt with a variety of specialised subjects which had to be mastered by the architect. The Association was a body of students with absolute liberty to think for themselves, and so to preserve the sturdy independence of art. What in the absence of enthusiasm was there to inspire the student to do things worth remembering? Upon the powers of the designing members of that Association depended the future of architecture in England. There would be reflected in their work not the Association's stamp, not their education, not their training, but what the young men of the present day were in themselves. The art of architecture was as truly an expression of human thought as was music or poetry. Architecture inspired, excited, incited, enthused the mind of the student in a way which no other form of work could emulate, and until the student felt this he was not worthy to call himself an architect.

The vote of thanks having been carried by acclamation, the President briefly responded, remarking that Mr. Arnold Mitchell gave him far more credit for the scheme of removal to the Architectural Museum premises than was his due. The whole of the credit of the original idea belonged to Mr. Maurice B. Adams, who was the first to propose it and make the offer, and it was entirely owing to Mr. Adams's enthusiasm that the committee of the Association were able to avail themselves of such an advantageous offer.

ARCHITECTURAL EVOLUTION.*

BEFORE commencing my paper may I be allowed to say a few words about the work of the Chair to which I have recently had the honour to be appointed? The Chair was founded in 1840, and is therefore the oldest Chair of Architecture in England. T. L. Donaldson was the first Professor, and his memory is kept green in the college by the silver medals presented annually which bear his name; Hayter Lewis was the second, and the third was Roger Smith. Those who knew Professor Roger Smith will bear me out when I say that his kind heart and lovable disposition made him many friends. He was ever willing to give his time to younger men who came to him for advice, and his ripe experience was always at their service. My acquaintance with him, although slight, commenced many years ago, shortly after he was appointed to this chair. Recently I had occasion to see him two or three times on a certain matter, and nothing could exceed his courtesy and kindness. His death will, I feel certain, be keenly felt by the many who during his long tenure of the Chair had the good fortune to be his students. Professor Roger Smith, like his predecessor, confined himself chiefly to lectures arranged for students whose work in the daytime in offices left them only a few spare hours for outside study. No other course, doubtless, was possible in the days when the pupilage system was the only method by which men could study to be architects. But architectural education, like education in other subjects, is undergoing a change. The pupilage system will continue, but it seems probable that it will continue in a modified form. It will continue, because only in an office can men get thoroughly in touch with actual practical problems and learn the inner mysteries of their profession: it will probably be modified because the feeling is growing that to enable a student to reap the full benefit from the work placed before him in an office a preliminary training is necessary. Lectures after office hours are unsatisfactory for many reasons. Moreover, in any systematic course of study for our profession, and I think I may say

for any other also, interest centres not in the lecture-room, but in the studio, laboratory, or classroom as the case may be. Lectures in any course of study of a practical character are but interludes; they have their value, but they require supplementing so much that to make any course of real value a student's whole time has to be devoted to it. The council and faculties of this college have realised the necessity for a more systematic course of training for architectural students than has been regarded as possible in the past. I believe with them that the time is ripe for a departure from former methods, and I also believe that before many years have run, university courses in architecture will be as general in England as they are now in America, and in some of our colonies. Architectural evolution is not merely a matter of academic interest. It has its practical side, which is of value to all architects. To trace the workings of a man's mind in his work; to see how, ever observing the requirements of his time and adapting himself to his materials, he took an idea from here and an inspiration from there, and so treated them as to give them new expression, is in itself excellent practice for all who are called upon to design. As an historical study it is the most fascinating of any. That all styles, from the earliest days of Egypt to the time of the great Renaissance of the 15th century, form an unbroken sequence, few will deny. A few links here and there may be missing in the chain, especially in the earlier work, owing to the lapse of years, but these are becoming fewer and fewer daily. In a short paper like this it is impossible to mention every instance or to trace every step. All that can be done is to illustrate the truth of the contention by reference now to an individual building, now to a group of buildings, and now to some constructive point which had considerable bearing on the development of a style. Other instances, doubtless, will occur to many of you of like importance which might with equal fitness have been given.

Of the many factors which determined architectural development in different countries and at different periods, climate, religion, the nature of buildings, the materials available, and the state of the labour market may be regarded as the most important. All these exercised their influence in turn. Rome, with its teeming population inclosed within its walls, a population which demanded not only houses to live in, but also vast public palaces for their recreation and amusement, required buildings very different from those of simpler Athens. To have built these, many stories in height as most of them were, with the lintel of the Greek, would have been an extremely difficult, if not an impossible, task. The Romans, therefore, would have been forced into using the arch, even if they had not early acquired a taste for it from the work of their neighbours the Etruscans. But the arch by itself would not have been sufficient to overcome all the difficulties they had to contend with in the erection of a huge building such as the Colosseum, if it had not been that, in the neighbourhood of the city, there existed ingredients which formed a remarkably strong cement. This enabled them to use concrete to a far greater extent than had been done before, or has been possible since. For the mixing of the concrete and its employment for walls and vaults unskilled labour was all that was required.

The Greek temple, with its small naos and external peristyle, was eminently appropriate in a country where the people lived much out of doors, and where the public worship was performed outside and not inside the building; but when Christianity became general, the services demanded a different type of building even in countries where the climatic conditions were much the same as those of Greece. The changes which were made are well illustrated in the present Cathedral of Syracuse, which is one instance out of many of the conversion of a temple into a church. A wall was built between the columns of the external peristyle, so that the ambulatory became the aisles. Openings were pierced in the naos wall to connect the aisles with the nave, and a chancel was built out at the east end. The entrance was reversed, and the posticum of the temple became the porch of the church. When new churches were built, the idea for these was taken from the colonnaded timber-roofed basilicas of ancient Rome. In the early days of Christianity money was scarce and workmen as a rule unskilled, and the basilican plan and methods of construction provided the largest possible floor-

space for the congregation at the lowest possible cost. Moreover, after the time of Constantine, old marble columns to divide the nave from the aisles were to be had almost for the asking from the ruins of the secular buildings of the great city, and by their aid a decorative effect could be obtained without much expense. In claiming that all architecture is evolved from previous efforts, one is merely reiterating the old truism that nothing comes out of nothing. The contention does not rob an artist of his claim to originality. It merely emphasises the fact that true originality—the originality that produces lasting good, and is not merely a passing fashion—is the outcome of knowledge. This knowledge may be either traditional, as in the days when the secrets of a man's craft were handed down from father to son for generations, or it may be acquired by study, as was the case with Brunelleschi, Bramante, and other great early masters of the Renaissance. An architect of the present day has to conform to much the same requirements and to work with much the same materials as the myriads of his predecessors. All that he can do is to try and advance one step further than they have. Behind him is a vast store of accumulated treasure, and if he can extract from it a few grains, and infuse into them his own spirit, his own individuality, he has done as much as anybody can expect to do. What is *art nouveau* is seldom true art, and what is true art is never entirely new. To say that Anthemius of Tralles learnt much from his Greek and Roman predecessors is not to detract one iota from his reputation. To hint the opposite is only to suggest a doubt as to his sanity. In his beautiful detail the inspiration drawn from ancient Greek mouldings and carvings is so undoubted that even if the connecting links were lost—which is far from being the case, as the work in Syria of the 4th and 5th centuries shows—the similarity between the two is proof enough. Not quite so apparent at first, but really quite as great is the connection between the plan and construction of his great church, St. Sophia, Constantinople, and such a Roman building as the Basilica of Constantine. In both buildings the supports are few, and consist of two great piers on each side, which separate the nave from the aisles, and mark the three compartments of the central area. The side buttressing to resist the thrusts is similar in both and each building, has or had a screen of columns between the great piers, which served to support the galleries, and at the same time to give scale to the building. The screens in the church still remain, and form one of its most beautiful features: those of the Basilica have long since disappeared. Where the church differs principally from the Basilica is in the plan of the ends of the central area, and in the substitution of the dome for the intersecting vault. Each bay of the basilica is square, and all three are equal. In the church the central bay alone is square, the ends are semi-circular, and opening out of each big semicircle are colonnaded niches. The double apse arrangement is a Roman device. One of the large halls in the Baths of Diocletian, Rome, has an apse at each end, and full width of the hall, and a similar plan was also followed in many of the entrance vestibules to buildings such as the baptistery of Constantine and the tomb of Constantia. The idea of the colonnaded niches is also Roman, if the restoration of the Baths of Gallienus, of the 3rd century, are correct. Even if they are not, St. Sophia is not the earliest Byzantine building in which they occur. They form the most characteristic feature of the interior of some of the circular and multangular churches of the period; of these, St. Sergius, Constantinople, San Lorenzo, Milan, and St. Vitale, Ravenna, were commenced before the old church of St. Sophia was burnt, and consequently before the design for the new one was made. But although the idea was old, the application of it was new. The plan of the central nave of St. Sophia is as though one of these circular buildings had been cut in half, and one half tacked on to each end of a central square. The result is a noble hall, which for about 220ft. has an average width of over 100ft. No other building of architectural pretensions in the world, not even St. Peter's, Rome, has an unencumbered floor space so wide for such a length. Anthemius showed his genius to a still greater extent in his treatment of the ceiling. He took the circular dome of the East, which from the early days of Assyrian art, many years before Christ, had ever been a feature there, and by the aid of pendentives placed it over the great central

* Inaugural Address read at the opening of the London School of Architecture, University College, London, on Wednesday, Oct. 7, 1903, by Professor F. M. SIMPSON, R.I.B.A.

square, high above the transverse and longitudinal arches. This was a wonderful achievement, not because of the mere span of the dome (that of the Pantheon is nearly half as wide again), not because a circular dome had never before been placed over a square by the aid of pendentives (examples exist in the East as early as the 2nd or 3rd century) but because no dome approaching in size that of St. Sophia had ever before been raised in that manner. The nearest approach to it is the 80ft. dome which covered San Lorenzo, Milan; but in this example it is doubtful if the space below was ever other than octagon. I have dwelt at some length on St. Sophia because it is not only a standing example, and a great one, of the truth of evolution in design; but it is also the most truly original, and at the same time, in my opinion, so far as the interior certainly is concerned, the most beautiful architectural creation in the world. It is a proof of the extent of Anthemius's originality, that he could combine eastern and western traditions, and yet produce so great a masterpiece. One of the most interesting chapters on architectural evolution is that which deals with the development of groining and the substitution of the clustered pier for the cylindrical column. The two must be considered together: they are inseparable. In the basilican churches, the intersecting vault which played so important a part in the large buildings of Imperial Rome finds no place. It occurs occasionally in early work in a few small churches in some parts of Italy; but it was not until the 11th century was well advanced that it became general in large ones. Basilican churches have timber roofs, which, as a rule, are ceiled on the under-side; the 15th and 16th century flat coffered ceilings at present in many of these churches probably took the place of earlier ones of similar design. These ceilings are continued without a break from east to west. In the Church of St. Miniato, Florence, however, built at the commencement of the 11th century, the timber roof over the nave is broken in its length into bays by means of transverse arches thrown across from pier to pier, with corresponding arches across the aisles. Whether these arches were introduced in the first instance because it was found by experience that the lofty and not over thick nave walls required lateral abutment, or because the builders had come to regard an unbroken ceiling as monotonous and unsatisfactory in appearance, is uncertain. The fact remains that about the time mentioned they began to be used, and consequently St. Miniato and one or two other churches of the same period may be regarded as the connecting links between the earlier church with its unbroken timber roof and the later church, which was divided into bays, each bay being vaulted. The vaults themselves were at first constructed much in the same way as the Roman vaults, without transverse arches, except that they were not so massive and heavy. The first alteration was that transverse arches were added, and the vaulting formed into bays. This innovation, slight though it appears at first, led to important changes. Diagonal ribs were next introduced under the groins—or points of intersection of the vault—and these, together with the transverse arches, formed a skeleton on which rested the severals or compartments of the vault. The vault now became a groined and ribbed vault which required specially-designed piers to support its different parts. The cylindrical column was ill-adapted for the purpose, although it is true that in some of the finest of the Medieval churches in France it continued to be used a century after the principle of vault supports had been perfected. The clustered pier, therefore, took its place. Piers, oblong and square in plan, had, it is true, been used occasionally in certain places in some basilican churches before this; but for the development of the complicated clustered plan from these more simple forms vaulting is entirely responsible. The change commenced with the introduction of transverse arches. In the small church of St. Zetache, Milan, of the 9th or 10th century, in which arches span the aisles but not the nave, the piers are not oblong but T-shaped, and the arches rest on the ribs at the back of the piers, and on corresponding pilasters on the aisle walls. When arches spanned the nave as well as the aisles the piers became cruciform. In St. Miniato, Florence, those that support the transverse arches are quatrefoil in section. This form, or the cruciform, was satisfactory so long as only transverse and longitudinal arches were employed, but as soon as diagonal ribs were introduced it became

insufficient, and shafts had to be inserted in the four internal angles of the cross to support them. In the nave of St. Ambrogio, Milan, built in the second half of the 11th century, the system is complete, and every rib and arch has its corresponding member in the pier. The buildings of the 11th and 12th centuries throughout Europe are heavy in appearance and massive in all their parts, but as the workmen grew more skilled, the work became much lighter. Nowhere is the change so conspicuous as in the vaulting and in the size and form of the piers. It was soon discovered that there was no necessity to carry the groining shafts down to the floor, and that they were better corbelled out from the wall, as then they offered more resistance to the thrust of the vault. Sometimes the corbelling is just above the piers, as in Exeter and Lincoln Cathedrals, sometimes it is at the level of the stringcourse above the arches of the arcade, as at Carlisle, and sometimes higher up still, above the triforium, as at Salisbury and Wells. In consequence of this change the piers could be made more slender, and beautiful forms such as are to be seen in Exeter Cathedral and in other churches of the 14th century were the result. Other modifications all tended in the direction of lightness. As the number of ribs of the vault increased, instead of attempting to provide a separate skewback and separate support for each—which in England would have been impossible in late work owing to their number—the builders brought them together to a common springing and the tas-de-charge, with its many advantages, was produced. In France the architects, as a rule, even as late as the end of the 15th century, clung to the simple and dignified quadripartite vault, in which only transverse arches and diagonal ribs are employed. In England, however, they departed from it, and multiplied the ribs to such an extent that the vault became a network of ribs so close together that little room was left for any filling in. As soon as this point was reached, the reason for the construction followed, for solong, disappeared, and the workmen said to one another, "Why form a skeleton and fill in afterwards? Why not build both rib and filling in together?" Thus was born the fan-vault—an English design pure and simple, and a logical outcome of the multiplication of ribs—in which both moulded rib and panel are worked on the same stone. I have taken groining as an illustration because it is the most characteristic feature of Medieval Architecture; but a similar sequence of development is just as noticeable in other parts of a building. I might have shown, for instance, how the design for the blind arcading on walls changed its character until the large windows of the 14th century left little wall space on which arcading could be placed, and how, as the windows became more and more like panels pierced for light, what wall space remained was covered with sunk panelling, to such an extent that in some churches, especially in those which retained their old stained glass, it is often somewhat difficult to tell at a glance which is wall and which is window.

The shock of the Renaissance first felt in Italy at the commencement of the 15th century was a shock which the builders there richly deserved. In England it came 100 years later, partly because the traditions of Medieval art were far stronger here than in Italy, and partly because the revival of letters had not yet taken a strong hold in this country. The great men of the Italian Renaissance, in seeking for inspiration from the ruins of ancient Rome, did a grand thing for architecture. They felt that the old art was moribund, and needed strong measures to bring it back to life. They had no qualms about taking hints from their predecessors of centuries before—from the men who built so sturdily, if somewhat roughly, and on so noble a scale. They felt that in the old buildings there was a virility that was deathless. The more they studied them, the more they became imbued with their spirit. And in this absorbing process they lost none of their own individuality. They sacrificed nothing to archaeological correctness. They never allowed tradition to interfere with utility. They abandoned none of their building science—science which had been accumulating for centuries; in fact, they added to their store. No one can say that Brunelleschi's dome in Florence is a copy of anything which had gone before. Its construction is different, its form different, and its detail. Sansovino's library in Venice, although reminiscent of the Colosseum, only shows what can be done by a man with fine ideas and rich imagination,

who is also a student of architecture. Peruzzi's charming Palazzo Massimi in Rome—a gem which stands alone amongst the colour-washed palaces of the city—has a refinement which no ancient Roman building possesses, and shows that the Greeks had not taught in vain the value of simplicity, and the full beauty of the lintel. These men picked up anew the thread of Classic traditions, which, although entangled for centuries with other threads, had never been entirely lost in Italy. Their work, although not coming in natural sequence like the Byzantine, Romanesque, and Gothic, has still a place in the history of architectural evolution. It was not so much a Renaissance as a recovery. What chance have we to-day of a similar recovery in England? The conditions which exist here now are not so far different from those which prevailed in Italy in the 15th century. It is true that the fine traditions, started by Inigo Jones and continued by Wren and his followers, were all destroyed by the two revivals of the last century; but we still have their buildings almost as fresh as ever. The lapse of years since they were built is trifling, compared with that which separates the early days of the Italian Renaissance from the time of the Roman Emperors. The threads ought not to be so difficult to pick up. In fact, one may fairly say, when one considers much of the work of the last ten or fifteen years, that this has already been accomplished. How long, however, shall we continue to hold them? When one remembers the see-saw of the last half of the century just passed, he would be a bold man indeed who would venture to prophesy. And yet agreement amongst architects is absolutely essential if our art is to progress as it should progress. No art can advance satisfactorily when its exponents are pulling in different directions. Such a state of things is bad for architects, and worse still for workmen, as they are called upon to work in one manner one day, and in another the next. Is it to be wondered at that, under the circumstances, they so often fail to take an interest in what they do? It is unsatisfactory also for the general public who, seeing no standard, are apt to believe that there is no art.

For a real advance, harmony between architect, builder, and client is essential. It existed in the 18th century in England; it existed in the 15th century in Italy; it is the secret of the stride made by architecture in the Middle Ages. It is true that in one sense the old war of the styles is now over. It is true that men are no longer eager to cut one another's throats over the merits of two phases of architecture, or to dispute with each other regarding the correctness of the curve of a moulding. But is it peace? There are still two camps. There are still Classicists although they are no longer pedants, and there are still Romanticists, although they have ceased to be mock-Medieval. A fusion between the two, if it be possible, although it would take time would be worth some waiting for. Some years must elapse before one can be expected to lay down with the other. But as the Classicist gets a little more playful, and the Romanticist a little more formal, the two may meet. After all, the principles underlying good work are much the same in whatever language they are expressed, and the differences perhaps are not so great as appears on the surface. In the last century men fell into the evil of a too literal rendering of old work; but that is no reason for going to the other extreme and ignoring it altogether. It seems to me that the folly is quite as great to refuse profit by the successes and failures of the past as it is to remain indifferent to and ignore new developments in building science. The masters of the Renaissance succeeded because although they studied old work they did not copy it. They blended its essence with the requirements of the time, and so produced new art. As they worked so might we. What is wanted is a basis from which to start—something that the weaker can fall back upon, and the stronger advance from. And if there can only be agreement as to what that basis should be, there is every chance that the end of the century will see a traditional vernacular style once more flourishing in England, and that another chapter will be added to the history of architectural evolution.

New Board schools, which have been erected at Canterbury at a cost of about £20,000, including site, to accommodate 1,020 children, were formally opened by Dean Wace last week.

CHARTERED SURVEYORS.

THE Council of the Surveyors' Institution have just issued to the members copies of the by-laws of the Institution, as amended by general meetings of members, in accordance with the provision of the Royal Charter, and sanctioned by His Majesty's Privy Council.

Among the important amendments now introduced is the permission to Fellows to use the title "Chartered Surveyor" alternatively to the designatory letters "F.S.I.," and a similar option to professional associates to use the like "Professional Associate Chartered Surveyor" in lieu of "P.A.S.I." The change has been long in contemplation, but any alteration of the by-laws of and institution incorporated by Royal Charter involves numerous formalities, and the Lords of the Privy Council are not moved to sanction any innovations until they are fully convinced that their effect will be to more completely carry out the objects for which the Charter was granted.

Among the reasons for this new step are, we understand, a recognition of the necessity to prevent, in the public interest, as well as in the interest of the profession, any misleading use of the designatory letters. It has been found difficult, if not impossible, to deter unprincipled persons from using any particular alphabetical combination unless a fraudulent intent could be clearly shown, and, again, it has been felt that, to the ordinary client desiring to engage the services of an expert, the letters F.S.I. do not convey any guarantee that the user of them is a member of a society authorised to test and certify his professional capability. These two points would be amply met were the designation "Chartered Surveyor" to be widely adopted by Fellows of the Institution, as we have no doubt will be the case.

Among other changes effected by the revision of the by-laws is the adoption of certain rules which shall be deemed fundamental rules of the institution, and the breach of which shall subject a member to suspension or expulsion. A member is forbidden by these rules to engage in or be connected with any trade or occupation inconsistent with his profession, to allow or to agree to any participation by a solicitor, accountant, or liquidator, in his fees, or to accept illicit or secret trade or other discounts, commissions, or allowance in connection with his professional business.

A new by-law provides for the suspension or exclusion of members guilty of infringing the said fundamental rules or of felony or fraud, or who have been adjudged bankrupt or have made an arrangement with creditors. It also forbids the improper use of any professional designation, description, or initials, and the use by a firm of designatory letters or descriptions where some member or members of the firm are not members of the Institution.

WATER SUPPLY.*

ALTHOUGH there are many treatises and papers on this branch of engineering, the volume recently published by Charles Griffin and Co., Ltd., written by Mr. Reginald E. Middleton, M.Inst.C.E., &c., will be welcomed by students and practical engineers. The author sets forth in a concise manner the scientific principles of the subject, and the work will serve as a good introduction to the larger treatises that have been published. The author devotes special attention to such questions as the quality of water, interpretation of analyses, stability of masonry dams, flow of water through pipes, and other elementary matters. Thus in Chapter I. he found under various heads such questions discussed as "selection of source," investigation of head, engines and pumps, impounding reservoirs, compensation water, mode of purification, filter beds, several reservoirs, distribution, &c. To assist the mind of the student a diagrammatic table or summary is given of the main points advocated. In respect rainfall there are three kinds: rain falling on paved surfaces, rain percolating underground, rain falling on roofs not collected. Requirements as to quality of water are next enumerated. The author shows that no water is chemically pure; mineral purities of various kinds are mentioned, gaseous, gettable, and animal impurities. Under the heading of "Bacteria" and "Non-pathogenic

Germs," the importance of this branch of inquiry is pointed out. Of the latter the larger number of micro-organisms are shown not only to be non-injurious, but indispensable to healthy existence. Tests for hardness and various chemical properties are mentioned which are necessary to be known before the requirement of quality is met. The engineer must know the history of the water supply and its exact composition before making any decision. Requirements as to quantity are equally important, and have to be next considered. As to rate per head for domestic purposes the unrestricted consumption seldom exceeds 17 gallons per head per diem in towns, and 12 gallons in rural districts, and a provision of 20 gallons in urban and 15 gallons per head in rural districts is ample. The variations in demand and monthly variations are stated. For a single day the demand may exceed the average by 40 per cent. The causes of waste are pointed out, much of which is preventable, due to leakage in pipes and defective cisterns. There are few places, the author says, in which the amount of waste is less than 10 per cent. The average rate of increase can be determined graphically, and this is shown by a diagram. How to determine the catchment area is shown, and the manner of estimating the quantity. The rule is thus stated: "To obtain the quantity, multiply the catchment area or area of gathering ground in acres by the available rainfall in inches, and if the quantity is wanted in cubic feet, multiply the result by 3630; but if required in gallons multiply instead by 22,650." It is useful to remember that lin. of rain per annum represents a flow of 40,000 gallons a day from each square mile of catchment area. The deductions from rainfall, evaporation, and flood are pointed out. The directions given by the late Mr. J. G. Symons for securing uniformity of practice among rainfall observers are useful. The student will find information about rain-gauges, deductions for dry seasons, amount of storage required, gauging streams by means of rectangular and V-notches, floats, current meters, &c. A deduction of 20 per cent. (one-fifth) must be made from the average rainfall to obtain the mean fall of three successive dry years, and a further deduction for evaporation some 12 in. or 15 in. In the next chapter supplies requiring storage are considered, and many useful rules are given by which the storage capacity can be found. The construction of storage reservoirs, dams, slopes, concrete walls, &c., are described in an elementary manner, after which masonry dams are described and illustrated and the stability of the dam mathematically discussed and its dimensions ascertained. The mathematical principles of resistance to sliding and crushing, triangular and trapezoidal sections are pointed out. Other chapters deal with purification of water, service reservoirs, flow of water through pipes, distributing systems, pumping machinery, &c. Mr. Middleton's work will be found to contain in a succinct manner the elementary principles necessary to be mastered before undertaking the water supply of any urban or rural district. The work is illustrated with plans, and is well printed.

We have received from Mr. Peter Stuart, F.R.S.A., an interesting souvenir of the visit of the Congress of Sanitary Engineers to Stuart's Granolithic Stone Company's Works in Glengall-road, Millwall Docks, on May 2 of the present year—a meeting fully reported in our issue of May 8, p. 643, last volume. The memento takes the form of a large and very clear photograph of the group of about one hundred members of the Sanitary Inspectors' Association assembled in the extensive grounds, the host, Mr. P. Stuart, the president, Mr. Isaac Young, and the hon. secretary, Mr. E. Tidman, being easily distinguished. In the foreground and all around are piled specimens of granolithic paving and flooring, briquettes, voussoirs, and lintels, the finished products of the firm.

Giovanni Focardi, of Florence, the well-known sculptor of realistic groups and caricatures, has just died at the age of sixty-one. Among his works are "I'm first, sir"—two little newscasters, "You Dirty Boy," "Sweet Rest," exhibited at the Academy, and "Othello and Desdemona."

The National University of Buenos Ayres have published a pamphlet describing exhaustive tests made by Mr. Emilio Palasio to ascertain the resistance of Argentine timber. The experiments bear on twenty-two different kinds of timber, and comprise tensile tests, compression and shearing tests with and across the fibre, and bending tests. The pamphlet is published by the Imprenta de la Revista Técnica, Moreno 463, Buenos Ayres.

BRIGHTON BUILDING EXHIBITION AWARDS.

THE following are the awards made by the jurors appointed by the committee:—

The Silver Cup: The Art Pavements Decorations, Ltd.

CLASS I.

Gold Medal, The Art Pavements, Ltd.; Bronze Medal Messrs. Mead Bros. and Messrs. Elliott and Son, Hastings; Diploma, The Crowborough Brick Co.

CLASS II.

Silver Medal, Messrs. Gilkes and Son; Bronze Medal, Messrs. Perry and Sons, Duke-street; Diplomas: Mr. Boekbinder and The Sussex Cement Co.

CLASS III.

Diploma, The British Uralite Co.

CLASS IV.

Gold Medal, Messrs. Morris and Co.; Diplomas: Mr. A. W. Loomes and The British Challenge Glazing Co.

CLASS V.

Silver Medal, Messrs. Elliott, of Caversham; Diplomas: The Karri Co. and The Lift and Hoist Co.

CLASS VI.

Gold Medal, Messrs. George Jeannings and Co.; Diplomas: Mughan's Geysers (E. Long and Co.), Messrs. E. G. Brown, Ltd., and Mr. Shoemith.

CLASS VII.

Silver Medal, Messrs. Yates, Haywood, and Co.; Bronze Medals: Mr. Saunders, of Black Rock, and The Elphicas Fire Alarm; Diploma, Mr. F. V. Hadlow.

CLASS VIII.

Diploma, Mr. Phillips, for photographs.

CLASS X.

Diploma, Messrs. Foulger and Co.

CLASS XI.

Bronze Medal, The Herne Hill Rustic Works.

CHIPS.

The new town hall and council offices at Horbury, near Bradford, were formally declared open on Friday. The building has been erected at a cost of more than £6,100.

The work of relaying the corporation's tramways at Gloucester in connection with their conversion to electric traction is about to be commenced.

The corner-stones were laid on Saturday of a new church which is to be built at the Whaley Bridge end of the parish of Chapel-en-le-Frith. The building, which will be named Christ Church, will be of a plain character, and is estimated to cost about £500, and seat about 250 persons. A tower will be added in course of time.

The Ordnance Survey have issued a cheap map of the Edinburgh district, on the scale of four miles to the inch, folded in covers. It embraces a dozen counties, and is printed in black and white, with the main roads in colour.

The Right Rev. Dr. Whiteside, Roman Catholic Bishop of Liverpool, laid, on Sunday, the foundation-stone of a new Roman Catholic school and chapel in Windermere-road, Leigh, Lancs. A site of 3,800 yards has been secured, and the new premises will occupy the northern half of the site, leaving the other half available for a future church and priest's house. The new building will be of two stories. The upper story will be used as a chapel, and will accommodate 600 people. The school on the lower story will provide accommodation for 160 infants and 90 mixed scholars. The cost of the building alone, exclusive of land and furniture, will be £5,500.

A new Roman Catholic church at Walworth, S.E., was opened on Michaelmas Day. It is built of brick with facings of stone from Portland and Bath. Early English in style, it was designed by Mr. F. W. Tasker, A.R.I.B.A., and every inch of the ground has been utilised to afford the largest floor-space for the congregation, the full capacity being for 600.

A Local Government Board inquiry was held at the Council House, Birmingham, on Tuesday, by Major J. Stewart, R.E., into an application by the city council for permission to borrow £13,000 for the purchase of land and of certain water rights at Netchells for the purpose of improving the river Rea, £14,000 for the purchase of land at Little Bromwich for the provision of a public park, £3,850 for the purchase of three houses in Jamaica-row for market purposes, and £57,850 for works of sewerage and surface water drainage.

After many delays the Dean and Chapter of Exeter have finally approved the inscription to appear upon the Richard Blackmore Cenotaph in their cathedral. This memorial, the carrying out of which was placed by the committee in the hands of Mr. Harry Hems, of Exeter, is now in an advanced state in that well-known sculptor's studios. It includes a portrait of the novelist executed in statuary marble, and will be placed close to the north-western entrance to the cathedral below a small window which has been filled with stained glass as a further memorial.

*Water Supply: A Student's Handbook. By REGINALD E. MIDDLETON, M.Inst.C.E., M.Inst.Mech.E., F.S.I. London: Charles Griffin and Co., Ltd., Exeter-street, and.

OBITUARY.

GEHEIMRATH FRIEDRICH LIPPMANN, Director of the Royal Academy of Engravings in the Berlin Museum, who died on Sunday, aged 63 years, was probably the first authority on his own department of art. During the past seven-and-twenty years he had spared no labour in arranging the originally chaotic collection of engravings in the Berlin Museum so as to make it a model of what such a collection should be. He strove to secure the acquisition of the best examples of the engraver's art for the Berlin Museum, and to substitute better ones for those which were inferior. Dr. Lippmann especially directed his efforts to perfecting the Dürer collection, which is now the most important next to that in the Albertina in Dresden. In 1882 the Duke of Hamilton's collection of manuscripts was acquired, and with it Botticelli's illustrations to Dante's *Divina Commedia*. Dr. Lippmann also assisted in the publication of reproductions of drawings by Dürer, Rembrandt, and other masters.

CHIPS.

The award of Mr Thomas Blashill, F.R.I.B.A., in an arbitration held in connection with the erection of University Hall, Clare Market, has now been published. The contractor, Mr. Howell J. Williams, claimed £3,061 17s. 2d., and has been awarded £476 14s. 6d. The claimant conducted his own case, and the architect of the building, Mr. Maurice B. Adams, F.R.I.B.A., acted on behalf of the trustees. No solicitors were employed.

A monumental slab has been placed in Durham Cathedral to mark the burial-place of Richard De Bury, Bishop of Durham from 1333 to 1345. He was a prelate distinguished for learning and charity, founded a large public library at Oxford for the use of students of Trinity College, and was said to have possessed more books than all the other bishops in England. The new memorial, which has been given by the De Bury Society of America, is of white marble, and bears on its face a sculptured representation of the bishop in his robes in bas-relief.

It has been decided to erect a permanent memorial in the Cathedral of Norwich to the late William Cadze, a well-known surgeon. Subscriptions are limited to one guinea, and confined to the medical profession.

Mr. F. W. Pomeroy has been intrusted with the execution of the statue in Liverpool of the Right Rev. Monsignor Nugent, which is to contain allegorical figures and groups of figures descriptive of incidents in the labours of Monsignor Nugent on behalf of the suffering and homeless poor of that city.

Lord Methuen will open to-morrow (Saturday) a new parish-hall at Bethnal Green, which has been erected at a cost of £3,000.

On Thursday next, the 15th inst., the great equestrian statue of General Sherman will be unveiled at Washington. The statue is the work of a Danish sculptor Rohl-Schmidt, who died three years ago while at work on it, and several Scandinavian artists, among them Stefan Sinding, have assisted in carrying out the designs in relief and the side figures representing War and Peace.

Last week the Bishop of Barking opened the new and permanent church of the Felsted School Mission at the Victoria Docks. The edifice, which is called the Church of the Ascension, has been built after plans by Messrs. J. E. K. and J. K. Cutts, and will seat 550 people. Owing to the treacherous nature of the ground the building has cost over £5,200.

The first train entered Coomassi on Thursday. A few details of the railway, of which for the present at least that place is the terminus, may be of interest. The total length of the line from Sekondi on the coast up to Coomassi, is 180 miles. Work was begun at Sekondi in 1898, but the first section of 40 miles to Tarkwa was not finished till 1901. The work has since proceeded far more rapidly, and the 140 miles of line between Tarkwa to Coomassi were laid in 27 months. The gauge is 3ft. 6in. and the line is single; it is laid on steel sleepers, the bridge being also of steel with concrete piers. The cost has been about £1,000,000, and the construction has been carried out by the Gold Coast Colony Government itself, with Messrs. Shelford and Son as consulting engineers. In addition to the line already completed, which serves the goldfields at Tarkwa, Obuassi, and Akrokerrri, branches are to be made forthwith to facilitate the development of the fields at Prestea and Prinsu.

The City Corporation have decided to invite competitive designs for the reconstruction and lowering of Southwark Bridge, with instructions that they are to be as "artistic as possible." A proposal to refer to a committee the question of allowing the L.C.C. electric tramway lines from South London to be continued over the bridge was negatived.

Building Intelligence.

BRISTOL.—The David Thomas memorial church was reopened on Sunday after being for some time in the hands of the contractors. During the day a memorial window, in recognition of the first minister, the Rev. W. Clarkson, was unveiled. Under the supervision of Messrs. Maynard, Froud, and Green, architects, of Bristol, a gallery has been placed in the west end of the church, and further additional room for pews has been afforded by removing the organ and rebuilding it in a new elevated chamber constructed to the south of the apse, above the deacon's vestry. In all, accommodation has been found for 150 more people, and other alterations have been carried out as part of the scheme, for which Messrs. E. Walter and Son were the general contractors.

CREW'S HOLE, BRISTOL.—The foundation-stone of the church of St. Aidan's, Crew's Hole, Bristol, was laid on Saturday by the Dowager Duchess of Beaufort. The church will meet the requirements of a large district on the eastern side of the city. The site is a prominent and exposed one on Nag's Head Hill, overlooking the valley of the Avon, and was purchased by the Church Extension Committee in 1902. The church of St. Aidan's, when completed, will seat 755 worshippers, and the plans for it have been prepared by Mr. G. F. Bodley, R.A. It will be built at an estimated outlay of £7,300, towards which £3,280 has been raised. The chancel, two bays of the nave, with the south aisle and morning chapel and vestries, will be proceeded with at once, and contracts for this work amounting to £1,873 have been signed by Messrs. Cowlin and Sons, of Bristol. The furniture, fittings, and contingencies will increase this amount to £5,260.

HIGHAMS PARK.—The foundation-stone laying ceremony of the Highams Park United Methodist Free Church took place on Saturday last. The design is in a late period of Gothic freely treated. The facings are in pressed red bricks, and the dressings are in white Costessey work. The block comprises church with transepts and apse, and two vestries, and the usual conveniences. The contract amount is £1,828. This building will form the school when the future church is erected, and is only the first portion of a large scheme. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's-inn, Strand, London, W.C.

HUNSLLET, LEEDS.—The new workhouse, situated near the junction of Wood-lane and Wakefield-road, at Rothwell Haigh, was formally opened on the 1st inst. The site comprises 18½ acres, providing space for future extension, the present accommodation of the workhouse and infirmary being 450. The administrative portion of the buildings, stores, laundry, boiler-house, &c., have also been designed on a scale sufficient for a building twice the size. The buildings consist of six groups—the entrance buildings, main building, laundry and boiler-house building, infirmary, lunacy building, and isolation hospital. The main building has the administrative block placed in the centre; and connected with this by glazed conservatory corridors are the pavilions for the aged and able-bodied classes. The laundry and boiler-house buildings are placed in a central position between the main building and infirmary. The infirmary is connected with the main building by a covered corridor; it has a nurses' home in the centre, separating the male and female pavilions. The maternity block is between the infirmary and the main building, and the lunacy block for 36 inmates consists of accommodation for male and female attendants in the centre, with epileptics on each side on the ground floor, and imbeciles above. The isolation hospital is also a complete building in itself. The aged married couples' cottages are on a high part of the site, near Rothwell Haigh, entirely separate from the main buildings. The buildings are lighted throughout by electricity, and there are two electric lifts at the centre of each infirmary pavilion. The total cost of the building, including the site, is approximately £85,850, or £182 per bed. The architect was Mr. J. H. Morton, F.R.I.B.A., of South Shields, and the builders were Messrs. Harold Arnold and Son, of Doncaster. The consulting engineers for the whole of the electrical work were Messrs. Shepherd and Watney, Greek-street Chambers, Leeds.

METROPOLITAN ASYLUMS BOARD.—At the meeting on Saturday of this body letters were read from the Local Government Board inclosing copies of orders which they had issued authorising the erection of additional buildings at Joyce (Green Hospital at a cost not exceeding £8,680, and the borrowing of that amount; and the erection of cottages at the Brook and Grove Hospitals respectively for the accommodation of the resident engineer at a cost of £1,070. Plans were approved for the reconstruction of the South-Eastern Hospital buildings at the estimated cost of £123,000. The scheme provides that the 288 beds in the temporary buildings shall be replaced by 385 in new permanent buildings, bringing the total accommodation for patients up to 488 beds, and it includes the extension and remodelling of the administrative block, and the provision of additional accommodation for nurses, female servants, and the male staff.

SHIREHAMPTON, BRISTOL.—The foundation-stone of the new parochial hall at Shirehampton, Bristol, was laid on Saturday. The hall is designed to accommodate 500 persons, of whom 370 would be seated on the ground floor, and the rest in the gallery at the end. The internal dimensions of the building are 65ft. by 30ft. There is a stage the full width of the hall, 11ft. from front to back, and raised about 3ft. above the floor. Caretaker's rooms are provided. The premises will be heated by hot water. The apparatus will be supplied by Messrs. Crispin and Son. The building has been designed by Mr. F. High Bond, F.R.I.B.A., of Bristol. The contract price for the building is £2,715. The contractor is Mr. C. A. Hayes, of St. Thomas-street, Bristol. Mr. James Long is clerk of the works.

STOCKPORT.—The chairman of the Board of Guardians of the Stockport Union, laid on Monday the foundation-stone of a new infirmary for workhouse patients. The site is at Stepping Hill, near Hazel-grove, some 26 acres of land having originally been purchased for the building of a workhouse to supersede the present workhouse at Shaw Heath, Stockport. The larger scheme was, however, abandoned, and it was decided to retain the present workhouse, and to obtain the necessary accommodation by placing the children in cottage homes apart from the workhouse, and by the erection of a new infirmary. Accommodation is to be provided in the new building for 320 patients and 36 nurses. The building contract was let for £39,980, and it is expected that furnishing and other expenses will bring the total to between £40,000 and £50,000.

WOLVERHAMPTON.—The Mayor opened on Monday the new wholesale covered market, which has been erected on a portion of the market ground in the centre of the town at a cost of £16,850. The new building adjoins the corporation cold stores, and is constructed of local brick, relieved with terracotta facings, and roofed with tiles. The roof is carried on girders supported by stanchions. On the main roof are three small turrets and a larger one, which act as ventilators, and break the monotonous line of the roof. The internal arrangement, in addition to providing floor space of 16,461sq.ft., available for letting in small lots, allows of permanent covered stands for wholesale dealers, with basements below and office accommodation above. The offices can be approached from the main staircase leading to the balcony, running the full length of the offices, or by a separate spiral staircase. Six of the stores have basements, with private doors leading into the space at the rear, to be used to facilitate the delivery of goods and the storage of empties. Ample roadways are formed, the widest being 20ft., and paved with sandstone cubes on 6in. of cement concrete; while the remaining floor space is paved with mastic asphalt on a similar bed of concrete. Six of the basements are reserved for the purpose of ripening bananas and storing empties. The plans have been prepared by Mr. George Green, the borough engineer, and the work, which has taken nearly three years to complete, has been executed by Messrs. George Cave and Sons, of Wolverhampton.

The corner-stone of a new church in Whittaker lane, Heaton Park, Manchester, to be named the Church of St. Hilda, was laid on Saturday. The church will cost £3,700, and will provide accommodation for some 315 persons. Later on it is intended to add a chancel, at an additional cost of some £2,000.

Engineering Notes.

GIGANTIC SIDING AT NORTHALLERTON.—The directors of the North-Eastern Railway Company have decided to construct a colossal siding for dealing with goods traffic at their Northallerton station on the main line from London to Edinburgh. The detail drawings have been approved, and provide for a siding which will be the largest in the world, and a model village of 500 houses for the workmen to be employed in the shunting operations. All this is estimated to cost £520,000. Sufficient land has already been secured from Northallerton to Longlands cabin between the main line and the Melmerby branch, and it is here that the siding will be made on good ground. It will have two gradients, one falling north and the other south, to accommodate the shunting operations. This immense siding, which will be in the V-shape, with Northallerton at the narrowest part, will act as a central collecting station for trains.

RAILWAY IMPROVEMENTS IN BIRMINGHAM.—A considerable improvement is in contemplation by the London and North-Western Railway Company upon the line between the north end of the tunnel at New-street Station and Monument-lane. The line between the Harborne Junction and New-street will be widened so as to permit of an additional set of metals being laid down. A new platform is to be erected at Monument-lane Station. The land required by the company for the completion of the scheme has been scheduled, as well as some fifty or sixty houses which will have to be demolished. The company will have to provide, under the Artisans' Dwellings Act, new houses near the city boundary at Soho. The work will be commenced by the end of the month. The Great Western Railway Company are already engaged upon important improvements upon their lines in Birmingham and the neighbourhood. The scheme for the extension of the lines and the station at Hockley has been completed, and preparations are being made for widening the line between Solihull and Birmingham. This will involve a rearrangement of the stations at Handsworth, Soho, Snow Hill, Bordesley, Small Heath, Acocks Green, and Olton. Snow Hill Station is to be reconstructed, and this work, together with the widening of the lines, will cost about a quarter of a million of money. The work at Hockley cost about £100,000, and a similar sum will be required for the new station at Tyseley, together with the provision of a locomotive department, with yard, at Small Heath. The arrangements for the commencement of the work in North Warwickshire are nearly finished. At Solihull and Knowle the stations have already been enlarged. The total estimate of the work undertaken in the county by the Great Western Company is about £1,000,000.

The population on the south side of Glasgow is growing so rapidly that within the last few years a number of new churches have had to be erected. The last one to be built has been put up by the extension committee of the Church of Scotland on a site at Newlands. The church, which has accommodation for 400 people, and cost £1,000, was opened for public worship on Sunday.

A large clock is about to be erected in the new Victoria Hall, Ellon, Aberdeenshire. It will have three large illuminated dials, and strike the hours. Messrs. John Smith and Sons, Midland Clock Works, Derby, are carrying out the work under the instructions of Mr. William Davidson, architect, Ellon. The same firm made a similar clock some years ago for Mintlaw, a neighbouring place.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied their patent Manchester grates to the new police buildings, Llanfairfechan.

Designs have been approved for the new Twickenham-green Baptist church and schools. The estimated cost is about £5,500. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's-inn, Strand, London, W.C.

The Southwark Borough Council have resolved to pave Marshalsea-road, through which thoroughfare the London County Council are now constructing a connecting link of electric tramways, with wood blocks, at a cost, as estimated by the borough engineer, of £1,937 15s.

In the village of Gilstead, near Bingley, on Saturday, memorial-stones were laid of a new Wesleyan chapel, which is being built from plans prepared by Mr. W. R. Nunn, architect, Bingley, to accommodate 250 persons, the cost being estimated at £1,300.

PROFESSIONAL AND TRADE SOCIETIES.

THE SOCIETY OF ARCHITECTS.—The following is the full list of nominations for officers and members of the Council for the year 1903-1904:—President, *Walter W. Thomas, Liverpool; vice-presidents (two), F. A. E. Pridmore, London, and *G. Gard Pye, London; honorary secretary, *Ellis Marsland, London; honorary corresponding secretary, *W. R. Mallett, London; honorary treasurer, *H. G. Quartermain, Merton. Council (thirteen nominations, twelve seats): *R. G. Bare, London; G. E. Bond, Rochester; *F. W. Chancellor, M.A., Chelmsford; C. Cole, Exeter; *W. Cooper, Hastings; A. Curry, Jersey; *J. W. Dyson, Newcastle-on-Tyne; *H. E. Knight, London; J. C. Jackson, London; *F. W. Macey, London; D. Morgan, F.R.I.B.A., Cardiff; *B. R. Tucker, London; and R. F. Vallance, F.R.I.B.A., Mansfield. [An asterisk (*) denotes nomination to office previously held; a dagger (†) proposed change of office.]

THE GLASGOW INSTITUTE OF MEASURERS.—The twenty-third annual meeting of this institute was held in the Building Trades' Exchange, Glasgow, on Monday, Mr. James D. Herbertson, president, in the chair. The annual report of the council on the business of the past year was submitted and adopted. The number of members is now 62, besides one honorary member. A donation of £2 2s. was again made to the Technical College for prizes in the building construction classes. The treasurer submitted a statement of his intrusions during the year, the gross funds amounting to £479 2s. 1d. The office-bearers for the ensuing year are:—President, Mr. James D. Herbertson; vice-president, Mr. John Baxter; secretary and treasurer, Mr. Thomas N. Hill, F.S.I., 180, Hope-street; auditors of professional accounts, Messrs. John Muirhead and John H. Allan; other members of council, Colin Young, Charles Marshall, George B. Walker, James Cameron, Thomas Duff, Anthony Purdie, and John Currie.

OHIPS.

The new storage reservoir which has been erected for the corporation of Ipswich in Park-road, from plans by Mr. Hamlet Roberts, their waterworks engineer, will be opened on Friday in next week, the 16th inst.

At Monday's meeting of Aberdeen Town Council, Mr. Samuel Milne, at present assistant gas engineer, was appointed engineer of the corporation gasworks, the vacancy being occasioned by the resignation of Mr. Alexander Smith, the salary to be £350 per annum, rising by annual increments of £25 till it reaches £500.

The directors of the Great Northern Railway Co., Ireland, at an extraordinary meeting held on Tuesday, passed resolutions authorising that company under the Castleblayney, Keady, and Armagh Railway Extension of Time Act, 1903, to subscribe £350,000 for the construction of the Castleblayney, Keady, and Armagh Railway, which will now be proceeded with. A Bill for the construction of a line from Drogheda to Mullingar in connection with the steam-packet service to that port organised by the Lancashire and Yorkshire Railway was passed last Session of Parliament, the capital for which is £350,000. The engineer for both these lines is Sir Benjamin Baker, C.B., K.C.M.G., and the contracts for construction, amounting to £613,000, have been placed in the hands of Mr. Robert Worthington, J.P., of Dublin.

On Saturday afternoon the memorial-stone of a new church for the Airdrie Evangelical Union Congregational Church was laid. The building is situated close to the public park, will be seated for 500, and will cost £2,500.

The Bishop of Derby reopened on Wednesday the ancient parish church of Normanton-by-Derby, which has recently been enlarged and renovated at a cost of £2,000.

A new mission church of stone is being built at Toronto, near Bishop Auckland, in place of an iron building which was blown down in the gale of February last. The foundation-stone is to be laid to-morrow (Saturday) afternoon. Accommodation is provided for 250 sitters. Mr. Thos. Hilton is the builder, and Messrs. Hicks and Charlewood, of Newcastle-on-Tyne, are the architects.

The new Marlborough Theatre, Holloway, was opened on Monday night. The new building, of which Mr. Frank Matcham is the architect, is spacious. A feature in the planning is the throwing back of the upper circle, so as not to project over the dress-circle, thus enabling the large gallery to be brought well forward. The stage measures 43ft. by 76ft.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

*Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—R. H.—C. E.—Architect.—W. T. (Brighton).
—H. V. G. and Co.—Engineer.—P. P. and Son.

Correspondence.

PROPOSED RECONSTRUCTION OF THE WAKEFIELD CATTLE MARKET.

To the Editor of the BUILDING NEWS.

SIR,—The committee disapproves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reasons: No guarantee that a professional assessor will be appointed, or that any of the designs submitted will be accepted. Premiums insufficient.

Architects are requested to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised.—I am, &c.,

HENRY A. SAUL, Hon. Sec.

Competition Reform Society,
10, Gray's Inn-sq., London, W.C., Oct. 5.

LONDON BUILDING ACT, 1894.

SIR,—In May last we received a notice from the London County Council stating that the

portico of a house at the West-end, belonging to a client of ours, was in a dangerous condition, and requiring that it should be taken down forthwith. A builder was at once employed to do the necessary work, and the total cost of the repairing was £7 10s. Shortly after this we received an application from the district surveyor for his fees relative to the matter, amounting to £1 16s. 3d., and although this seemed to us, under the circumstances, a very outside fee, it was paid at once. Yesterday morning, more than four months after the event, we received an application from the County Council for another surveyor's fee, amounting to £1 2s. 6d., and also for fees payable to the Council, 6s. 3d.; and this was coupled with a courteous intimation that unless the amount was paid within seven days legal proceedings would be taken. In other words, the County Council consider that it was necessary, forsooth, that two separate surveyors should be employed on this trifling matter, at a cost amounting altogether to £3 5s., or nearly 50 per cent. of the amount expended on repairs! Comment is needless.

No doubt it might be retorted on the part of the County Council that the Act provides for such expenditure. So much the worse for the Act. But we cannot for a moment imagine that it was the intention of the Legislature to countenance such proceedings as these.—We are, &c.,

QUAYLE AND OUVRY.

15, Arundel-street, W.C., Oct. 7.

In addition to the 30,000 which is being spent by the Glasgow and South-Western Railway Company on rebuilding the quay-walls, raising the crane foundations, and erecting a new 50-ton crane at the pier-head berths at Troon Harbour, a sum of £5,000 is being expended on a hydraulic system of wagon haulage.

At the annual meeting, in Newcastle-on-Tyne on Monday, of the Governors of the Durham University College, it was reported that £50,000 had been raised, which would enable the council to complete the College buildings (with the exception of the central tower), as a memorial of the late Lord Armstrong, and to erect a statue of him in the grounds of the Natural History Society's Museum, Newcastle. The work of completing the buildings is to be undertaken without delay.

The memorial to the late Mr. Joseph Cowen, newspaper proprietor, Newcastle-on-Tyne, and for many years Member of Parliament for that city, will take the form of a statue to be erected in Newcastle. The sum aimed at is £3,500.

At St. Andrew's Church, Southport, on Sunday, a memorial window was unveiled. In the window is depicted the "Call of St. Andrew" by the Lake of Galilee, the design being by Mr. A. L. Moore, of London, with Mr. W. Gilbee Scott, F.R.I.B.A., of London, as advisory architect.

The new London and North-Western Railway Company's line from Leigh, via Park-lane, to Wigan and Blackpool was opened on the 1st inst.

A new police station which has been erected in Mill-street, Bradford, Manchester, was opened on Friday. The station has cost £25,000, and will take the place of the old headquarters of the C Division in Fairfield-street, as well as of several substations. The building contains separate departments for police and firemen, and housing accommodation for several men of both forces. In the police department there are thirteen cells, and these, like the rest of the building, are lighted by electricity. It has been built from plans by Mr. H. Price, the city architect.

A steadier tone characterised the market at Tokenhouse-yard Mart last week, and though the number of properties was not large, there was a general improvement. The most important dealing was with the Windsor Racecourse, covering an area of nearly 122 acres, and held for nineteen years at a rental of £700, which sold for £22,000. The sales at the Mart during the week amounted to £67,637. For the corresponding week of last year the figures were £53,376.

A memorial tablet to the late Sir Frank Green, Lord Mayor of London during the year 1903-1901, was unveiled on Monday at the church of St. James, Garlickhithe. The tablet, which is of Verona marble, is set in a framework of alabaster, adorned with carving and gilding. Above the tablet are the arms and crest of the late Sir Frank Green.

A bronze statue of the late Queen Victoria is to be erected in front of the Royal Military Academy, Woolwich. The statue will be 8ft. high, mounted upon a red polished granite pedestal, decorated on the four sides with bronze reliefs, depicting the Royal Artillery in the four several engagements, "Crimea, Indian Mutiny, Afghanistan, and South Africa." Mr. Henry Price has been commissioned to execute the work.

Intercommunication.

QUESTIONS.

[12010].—**Smoked Bricks.**—Smoked bricks taken from an old chimney flue have been built in on the inside of new house walls, and I am afraid the smoke will show itself through the plaster and spoil any decoration put thereon. I shall be glad if any of your readers can tell me of a remedy that will kill the smoke stains in the bricks.—J. T. G.

[12011].—**Electric Lighting.**—I have to light a good-sized house in the country, requiring about 500c.p. lights, 30 of which would be in use at once, or about 34. Being only an amateur and not able to incur expense of a large battery of accumulators, I propose using 2H.P. oil-engine and a second-hand dynamo rated at 25amp. 55v. I should be obliged by any criticism of my estimate, also by information on the following points: 1. Can I use Nernst lamps, and are they reliable? 2. Can I charge a small 100amp-hour battery of 30 cells while drawing off current from it i.e., use it merely as a regulator? 3. Can I use any electric governor on oil-engine, so as to cut off power when load is lightened? 4. What is the simplest switch-board, embodying all essentials, and where can I get information as to instruction and wiring generally? 5. Do I need a compound-wound dynamo? 6. Would a car motor be reliable enough for daily wear? 7. Can I provide for upstairs lights after engine stops by little 10v. lights and accumulators in each room, say six sets, instead of setting up an accumulator battery?—DYNAMO.

[12012].—**Level.**—Will anyone acquainted with the use of and adjusting surveying instruments give me a simple method of putting in adjustment an ordinary dumpy surveying level, and of proving when so adjusted that it is correct?—DUMBY.

REPLIES.

[12002].—**Norwich.**—By an obvious slip, your correspondent "E. W. H. P." in his most interesting sketch of Norwich (Sept. 18) refers to the late Sir G. Gilbert Scott, R.A., as the architect for the new R.C. Cathedral in St. Giles' at that city. As a matter of fact, it was the great architect in question's talented son and namesake, the late George Gilbert Scott, F.S.A. (who also designed the clever church of All Hallows, Pepper-street, Southwark, S.E.), who was the architect of the exceptionally fine edifice in question; and it was under him the works were commenced and continued until his lamented and all-too-early death. The late Sir G. Gilbert Scott, perhaps the greatest power and organising architect of the last century; George Edmund Street, R.A., the hardest working and quickest drawer of details the architectural world probably ever saw; and Benjamin Ferrey, F.S.A., by no means the least (mark his church of St. Stephen, Rochester-row, Westminster, S.W., one of the first [A.D. 1830] of those great Gothic revival produced, and still worthily holding its own)—for as a man he was as sweet in disposition as he was earnest in his work. These, then, were three of the most prominent men of their profession who steadily remained—throughout the whole of their respective careers—faithful to the Mother Church of England. Architects, admittedly equally endowed, devoted their talents to R.C. work—(we recall the names of Pugin, Haddfield, Hansom, Goldie, and others)—with much brilliant success in that particular sphere. The names of Scott, Street, and Ferrey, however, will always be associated with Anglican, and not Roman, ecclesiastical work.—HARRY HEMS.

[12008].—**Normandy.**—The cost of living at good second-rate hotels in Cherbourg is 6 francs a day, inclusive (not exclusive) of wine. The particular hotel mentioned in my notes last week (the Hotel de Paris) faces the Quay, and is largely patronised for their meals by officers of the garrison. Travellers who may stay there do not fail to notice the capital old handrail (late 18th-century work) that winds story after story most gracefully up the tall, narrow staircase, and is excellently moulded to suit the grasp of those using it.—HARRY HEMS.

The members of the water committee of the city council of Birmingham, accompanied by the engineer, Mr. Mansergh, visited Wales on Friday for the purpose of inspecting the Liverpool waterworks at Lake Vyrnwy and Birmingham's new sources of supply in the Elan Valley. On arriving at Llanfyllin, the committee drove a distance of about ten miles to Lake Vyrnwy, the district from which Liverpool obtains its water. In the afternoon they visited the works, and remained the night at Vyrnwy. On Saturday morning the party proceeded to Beravader, and in the afternoon they inspected the filter-beds and other works at the end of Elan Valley.

At the last meeting of the Court of Common Council, Mr. Horncastle, the Chief Commoner, stated that a portion of the Roman external wall which went round the City, and was of the date of the 5th century, had been brought to light during the excavations at the Sessions House in the Old Bailey, and was in a marvellous state of preservation. The excavations had also revealed at the north end of the site an archway, which was apparently a portion of a subterranean passage-way, which at one time connected New-Gate, built about 1100, and the gaol.

At the Islington Town-hall, on Wednesday, Mr. H. Percy Bulnois, M.Inst.C.E., held an inquiry on behalf of the Local Government Board as to the views of the inhabitants on the memorial of the Islington Borough Council praying that the Norfolk-square area in the Essex-road, originally cleared ten years ago for the erection of dwellings under Part II. of the Housing of the Working Classes Act, 1890, might be kept as an open space.

LEGAL INTELLIGENCE.

SERIOUS CHARGE AGAINST A BUILDER.—At the West London Police-court on Saturday, Henry George Carey, 49, a builder, of 6, Windsor-place, Lower Weston, Bath, and Mary Carey, 36, his wife, were charged, on remand, with obtaining money by fraud from various tradesmen in Chiswick. Mr. Hanson, who prosecuted, stated that the defendants formerly lived at Chiswick, and had an account at the London City and Midland Bank. That account was exhausted in June, and since then they had been spreading a flood of worthless cheques over the district. In the end they went away, and a warrant having been obtained, they were arrested at Bath. Five witnesses, all shopkeepers, gave evidence to the effect that the female defendant gave them cheques in payment for goods purchased. Each cheque was of a higher value than the price of the goods, and the accused received the balance in cash. Most of the witnesses admitted that the defendants had on previous occasions presented valid cheques in payment of accounts. Mr. R. W. Barker, manager of the London City and Midland Bank, Chiswick Branch, stated that the male defendant had an account at the bank from November, 1902, to June, 1903, when it became exhausted. In all seventeen cheques had been returned by the bank. On August 14 the female defendant paid in £22, and on the following day drew it all out, and since then the bank had had no dealings with the accused. In reply to Mr. Pierron, who defended, the witness stated that in all £1,400 was paid into the account by the defendants from November, 1902, to May of the following year. Mr. Pierron said Mr. Carey was expecting money from a contract at Windsor, and would in time have met all the cheques. The magistrate committed the prisoners for trial.

ARBITRATION AT HEADLEY, HANTS.—At the Surveyors' Institution, Westminster, on Friday, before Mr. A. L. Ryde, sole arbitrator, the claim was heard of Professor Sonnenschein, of Birmingham University, against the War Department, in regard to a portion of land situated at Headley, which the War Office is compulsorily acquiring for the purpose of the erection of barracks, and the training of troops near Borden Camp, Wolmer Forest, Hampshire. Mr. Honoratus Lloyd appeared for the claimant, and Mr. Noble for the War Office. The claim was for £4,073, but after a consultation between counsel it was announced that a settlement had been arrived at, the claimant obtaining £1,875.

CHIPS.

The town council of Inverness elected, on Monday, Mr. John F. Smith, of Wolverhampton, as borough engineer and surveyor.

The joint drainage committee of Tottenham and Wood Green are having a brick sewer constructed at a cost of £27,000. Messrs. B. Cooke and Co. are the contractors, and the engineers Messrs. J. E. Murphy and W. H. Prescott.

The Scottish Court of Session having sanctioned the modification of the constitution of the Glasgow and West of Scotland College to permit of the election of a governor by the Glasgow Institute of Architects, an addition has been made to the board by the appointment of Mr. T. L. Watson, F.R.I.B.A., as the representative of the Institute.

The memorial statue of the late Mr. T. E. Ellis, M.P., which has been erected in the High-street of Bala, was unveiled on Wednesday. It stands on a pedestal 10ft. in height, and has been executed in bronze by Mr. W. Goscombe John, A.R.A.

On Saturday the Bishop of Peterborough dedicated a new chancel screen which has just been erected in St. John's Church, Leicester. The screen is the gift of Mr. and Mrs. Bunning, the donors of a peal of bells recently placed in the tower of this church at the cost of £1,000. The screen, which measures 17ft. between the chancel arch piers, is of wrought iron, and is mounted upon a base and steps of marble, of polished Belgian black and verde antico marbles. Above the screen is a cross. The whole of the work has been executed from designs by Mr. C. H. Löhr, by Messrs. Thomas Brawn, of Birmingham.

In our account of the opening, by the Bishop of Durham, of St. Chad's Church, Gateshead, no reference was made to the work done by Messrs. Emley and Sons, Limited, which included the paving of the whole of the aisles in stone and marble squares, and of the sanctuary in costly and highly polished marbles, the polished marble steps in the sanctuary and the floor and marble steps in morning chapel. The name of the donor was not Messrs. Easton, but Miss Easton.

On Thursday afternoon in last week memoria stones were laid in connection with the enlargement of the Copperhouse Wesleyan Sunday-school, Hayle. A new wing 20ft. by 22ft. is being added to the north side of the present schoolroom. Mr. S. Hill of Redruth, is the architect, and Messrs. R. Harris and W. Chinn are the contractors.

THE CROFT, ETCHINGHAM, SUSSEX.—GENERAL HOSPITAL, TUNBRIDGE WELLS.—KING'S LYNN GRAMMAR SCHOOL.—ST. PAUL'S CHURCH, LANDORE.—PROPOSED COTTAGES, LONG NEWTON.—BILLIARD-ROOM, BURNHOLM, YORK.—DESIGN FOR ENTRANCE TO A PUBLIC BUILDING.—SOUTH DOORWAY, ALL SAINTS, KIRTLING.

Our Illustrations.

THE CROFT, ETCHINGHAM, SUSSEX.

This house was built last year for Mr. T. H. Hornblower, on a charming site of some twelve acres, about one mile from Etchingham on the south side of the Burwash-road. The land slopes towards the south, and commands views over a wide stretch of country. In addition to the accommodation shown upon the ground floor there is a lower floor extending over the whole area, which is well lighted, owing to the rapid fall in the ground, and contains a large garroom, a workroom, dairy, &c. On the upper floors are ten bed and dressing-rooms. The house is built of red bricks, with Douling stone for the main entrance, &c., and the roof is covered with South-country tiles. The hall, which is 30ft. by 18ft., with a large bay window and a fireplace recess in addition, has oak beams and doors and an oak floor. There is a verandah-balcony at the ground-floor level with a flight of steps to the garden level. Mr. A. H. White, of St. Leonards, was the builder, and the architect was Mr. George Hornblower, F.R.I.B.A., of London. The drawing now illustrated was by Mr. T. Frank Green, and was exhibited in the Royal Academy this year.

TUNBRIDGE WELLS GENERAL HOSPITAL.

The large addition to this building, for which Mr. H. Percy Adams, Woburn-place, Russell-square, London, is the architect, comprises entirely new wards for all the patients. The existing old hospital will be utilised solely for administration purposes, and contains all the rooms for the committee, medical officers, matron, nurses, and servants, as well as the kitchen department and rooms for the hot water and heating plant. The new out-patient department is at one corner of the site, and entered by separate entrance from the goods-station road, and contains consulting rooms, examination rooms, large waiting-hall for patients; above the consulting rooms and dispensary (accessible for both out and in patients) is built the new children's ward, the cost of which has been defrayed by a special fund raised in memory of the late Queen's Jubilee. This ward will be a special feature of the hospital, as the walls are to be tiled with picture tiles telling nursery tales. The wards are built with the cross windows east and west, and the large windows at the end almost due south. Externally the buildings are of red brick, with stone dressings and tile roofs. Messrs. Jarvis and Son, of Tunbridge Wells, are carrying out the contract of about £22,000, the clerk of works being Mr. H. A. Taylor.

KING'S LYNN GRAMMAR SCHOOL.

The drawing by Mr. Basil Champneys, which we illustrate to-day, was exhibited at the Royal

Academy this last season. It shows the design which was made for a site in King's Lynn town: but since then the site has been altered, necessitating many changes in the scheme, so that the drawing must be considered in this light.

ST. PAUL'S CHURCH, LANDORE.

This church, which is now almost completed, will seat 600 adults, and consists of a nave, chancel, north and south aisles, with organ-chamber and clergy vestry, the choir vestry being placed in the basement. The site slopes considerably from west to east, and the space underneath has been utilised for a schoolroom and classrooms. It is built of thin-coursed grey Pennant stone from the Neath quarries, and red Hollington stone has been used for the dressings and tracery. The church is lined throughout with green Quarella stone. The roof is open to the apex, and the chancel is boarded and panelled, with moulded ribs, with carved and gilded paterae at the intersection, the main ribs being carried on carved and decorated corbels. It is seated with chairs, and the choir-stalls are executed in Austrian oak. The contract was let to Messrs. Weaver Brothers, of Manselton, Swansea, for £7,000. Mr. Bruce Vaughan, of Cardiff, was the architect.

COTTAGES AT LONG NEWTON.

The sketch for the above was in this year's Royal Academy, and is for the rebuilding of certain cottages which the Marquis of Londonderry recently acquired at Long Newton, the greater part of which is his property. A little delay is being caused with the commencement of the work owing to the scarcity of temporary cottages for the tenants, which have his lordship's great consideration. The buildings will be carried out in pressed brick, stucco, and green slates, and are situated between the church and school, and will add greatly to the village appearance, and face the high-road between Stockton and Darlington. Messrs. Harrison and Hunter, of Stockton-on-Tees, are the architects, who have also various farm buildings and other properties rebuilding on Lord Londonderry's Long Newton Estate.

BILLIARD ROOM, BURNHOLM, YORK.

This room is from the design of Mr. Arthur J. Penty, of Elingham House, Arundel-street, W.C. It was executed in oak with ebony panels over the chimney-piece. The carving is by Mr. Geo. W. Milburn, of York. The drawing was exhibited in this year's Academy.

DESIGN FOR ENTRANCE TO A PUBLIC BUILDING.

Mr. EDWARD CRATNEY, of Willington-on-Tyne, is the author of this design for a doorway to a public building, which has some degree of suggestiveness about it, with the recessed balcony above the porch, into which the steps extend. There is but very little space to accommodate expanding iron gate grilles behind the flanking columns of this porch, though these could be managed perhaps. Gates of some kind are necessary to exclude persons from intruding at night, presuming that the building is open to the street. Gates of this character do not look monumental in style, and seem somewhat out of keeping with such an entrance.

NORMAN DOOR, KIRTLING.

THE ancient church of Kirtling, about 5½ miles from Newmarket, still retains several features of its Norman origin—notably the fine doorway, which forms the inner entrance to the south porch, which is still in excellent preservation, the moulding and carving being exceptionally clear, including a grotesque figure of the Virgin over the doorhead. The church contains several monuments of the North family, the ancient seat of whom adjoins the church, surrounded by a deep moat: but only the main tower now stands to mark the site of what formerly was an extensive Baronial residence.

CECIL G. RAYNER.

An inquiry was held at Leeds Town Hall, on Friday, by Col. A. G. Durnford, at the instance of the Local Government Board, with reference to an application of the corporation for powers to borrow £220,000 in respect of electric lighting works.

An infirmary ward has been added to the workhouse at Newcastle-on-Tyne. The total cost is about £1,500, or about £18 per bed. Messrs. Newcombe and Newcombe, of Newcastle, are the architects; whilst the furnishings were seen to by Mr. Robson and Sons, Northumberland-street. The new ward was decorated by Mr. Moffatt.

COMPETITIONS.

CARDIFF.—The council of the University College of South Wales and Monmouthshire, at a special meeting on Tuesday, Sir Alfred Thomas, M.P., presiding, received a report from Sir R. Rowland Anderson, the assessor appointed to consider plans of college buildings sent in by competing architects. On the assessor's recommendation the council unanimously selected plans and designs by Mr. William Douglas Caröe, F.S.A., of Whitehall-place, London, who, under the terms of the competition, becomes architect of the proposed buildings, and, if they are not begun within three years, is entitled to a premium of 200gs. The buildings, for which a site has been given by the Cardiff Corporation in Cathay's Park, where a town-hall, law-courts, and other public premises are now being erected, are estimated to cost £224,355. The general scheme is to group around a great court various blocks of buildings, but the court will not be entirely surrounded. The area of the court is 52,000sq.ft. The blocks are arranged for the accommodation of the arts department, the Viriamu Jones memorial research laboratory, public health department, library, physics wing, women's department, and a great hall to seat 1,190 persons. The whole structure is designed to be architecturally in harmony with the other public buildings in the vicinity. The scheme permits of the erection of the buildings in sections, and the proposal is to proceed as soon as possible with the arts department, and to postpone the building of the remaining blocks, estimated to cost £140,942, until funds are available. The college building fund at present amounts to £70,000. The Cardiff Town Council, at a meeting on the same day, directed that £6,000 promised towards the cost of building the registry of the University of Wales on a site in Cathay's Park, also given by the corporation, be forthwith paid over in one sum to the university authorities.

LIVERPOOL.—At the meeting on Wednesday of the City Council, the Baths Committee submitted the following recommendation:—"That the design for the erection of baths on the George's Dock site marked No. 6 be approved, subject to the elevations and treatment of open space being amended to the satisfaction of the Baths Committee, and that the author of the design, Mr. Alfred Saxon Saell, F.R.I.B.A., 22, Southampton Buildings, Chancery-lane, London, be engaged to carry out the scheme, and that he be paid a commission of 5 per centum upon the original contract price of the building, in accordance with the terms of the conditions of the competition, and that an application be made to the Local Government Board for sanction to borrow the sum of £75,000 to carry out the work." The recommendation was adopted. The designs were on view on Monday and Tuesday in Room No. 31, Central Technical School, Byrom-street, Liverpool.

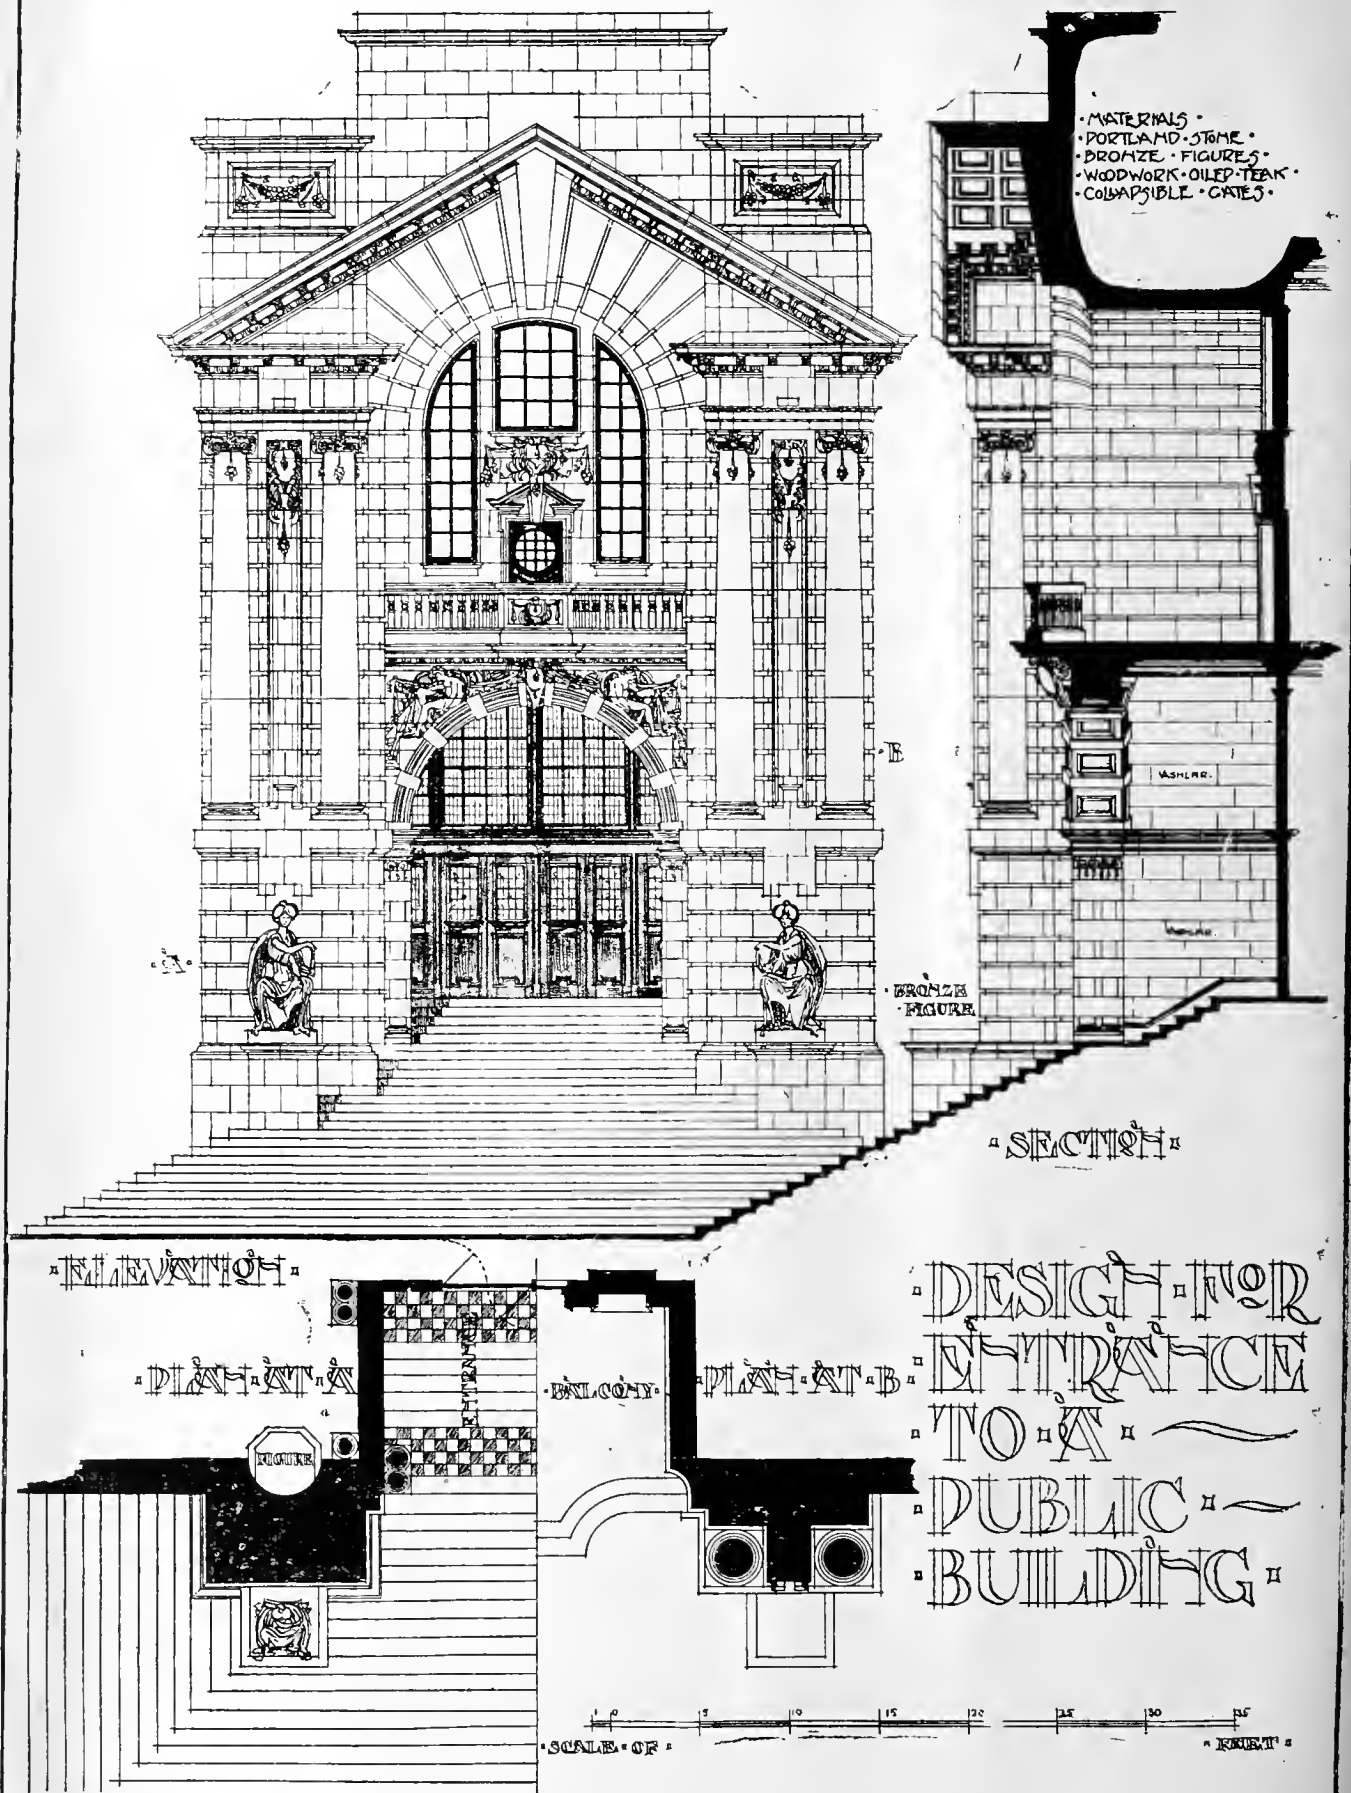

CHIPS.

Nine stained-glass windows have been placed in Bishop Russell's Chapel on the north side of Lincoln Cathedral, corresponding with those in Bishop Fleming's Chapel on the opposite side of the minster. The new windows chiefly bear the names and arms of sub-deans, and the design in each instance is an angel with outspread wings supporting a shield, with the arms encircled with colouring.

The town council of Brighton have obtained the sanction of the Local Government Board to the borrowing of £1,361 for the purpose of improving the Aquarium estate.

The condition of the steelwork in a number of Chicago office buildings was investigated some time ago by a number of architects. Mr. C. T. Purdy states that all the steel was found in a very satisfactory condition. The examination showed conclusively that if reasonably good care is exercised, structural iron in building work will not corrode. It also particularly emphasises the value of cement mortar in contact with iron as a preservative agent.

In the syllabus of the new school of architecture promoted by the newly-constructed Victorian University of Manchester, in conjunction with the Manchester municipal schools of technology and art and the Manchester Society of Architects, the students, under Professor S. H. Capper, have a first-year course indicated for such as intend to proceed to the Victoria University degree in the honours school of architecture. In a university course, however, which provides a complete education on the theoretic and academic side, no attempt will be made to interfere with the professional training which practical employment in offices of works must give.

WATER SUPPLY AND SANITARY MATTERS.

ST. HELEN'S WATER SUPPLY.—The new pumping station at Melling, near Ormskirk, which has been provided by the St. Helen's Corporation as an additional source of water supply, was formally opened by the mayor of St. Helen's on Oct. 1. The new pumping station includes two boreholes, each 24in. diam. and 560ft. deep, with horizontal compound engine, designed by Mr. J. J. Lackland, the borough water engineer, and constructed by Messrs. Robinson, Cooks, and Co., of St. Helens. The contract for the boreholes was let to Messrs. Timmins and Son, of Runcorn, and for the work generally Messrs. Hughes and Stirling, of Bootle, were the contractors. From the Melling station an 18in. main runs to the Knowsley station, where it joins a 24in. main to Brown Edge, Thatto Heath, where the corporation water-softening works and reservoir are situated. The distance from Melling to Brown Edge is close upon ten miles. The water-softening works are capable of dealing with 2½ million gallons daily, and the softened water flows therefrom into a covered reservoir holding 2 million gallons; but a much larger storage reservoir, with a holding capacity of 10 million gallons, is now in course of construction on adjoining land.

TORQUAY WATER SUPPLY.—The Mayor of Torquay and the members of the Corporation journeyed to Trenchford on Thursday in last week to inaugurate important works of construction, in connection with the town's moorland water supply. The scheme of extension upon which the Council now enters consists of the construction of a new reservoir at Trenchford, sanction for which was obtained only a few months ago. The reservoir will have a capacity of about 200,000,000 gallons, and cover an area of thirty acres. The greatest depth of water it will contain will be 50ft., while from the foundations to the top of the embankment there will be a depth of 80ft. The present roads running up the valley will be submerged and diverted. The width of the embankment at the summit will be 20ft., and at the base 300ft. The dam will be made with a concrete core below the surface of the ground, and above with a clay core backed with earth. The cost of the work is estimated at £22,000, and the reservoir will be constructed by the corporation itself, under the direct supervision of the water engineer, Mr. S. C. Chapman.

FLUSH TANKS FOR SEWAGE.—The session of the Civil and Mechanical Engineers' Society was opened by an address, on Friday night, in Caxton Hall, Westminster, when the president, Mr. A. Hanssen, chose as his topic "Flush Tanks." He considered that the great epidemics of cholera in the middle of last century were really blessings in disguise, because they called attention to the fact that one of the principal causes of epidemics was the pollution of the subsoil, and that all organic impurities and all waste products utilised as manure was got rid of as cheaply as possible. After references to the construction of sewers, and what they had been in the past, he attributed to the sanitary authorities of Westminster and Marylebone the knowledge which they now possessed of what sanitary sewers should be—namely, that they should be watertight, and laid at such a gradient that the sewage would flow through them with the velocity of about 2·50ft. per second. There were three classes of tanks:—(1) Those fitted with mechanical motions, such as deep basins, used either alone for the whole flush, or together with a siphon for separating the action of the same; (2) tanks with vacuum siphons where the tank was discharged by producing a slight vacuum in the descending leg of the siphon by means of a thin stream of water overflowing from the tank and falling through it. The water seat at the foot of the descending leg of the siphon in that case was seldom more than about an inch in diameter. (3) Tanks with plenum siphons, where the outlet pipe was provided with a deep water-seal, sometimes as much as 36in. deep, and the tank was filled with water to a corresponding height above the top of the siphon; the discharge took place when the air inclosed and compressed in the siphon by the action of the water in the tank was allowed to escape, either by means of a vent pipe or by forcing the water seal. All three types were in the market, and used in different parts of the country.

SKEGNESS.—On Friday Col. A. G. Darnford, R.E., Local Government inspector, conducted an inquiry at Skegness concerning the urban council's application to borrow £10,360 for new sewerage works. The scheme was explained by Mr. J. R. Elliott, A.M.I.C.E., representing the engineers, Messrs. Elliott and Brown, of Nottingham, and consists of new bacterial purification works, additional pumping station, and improvements and extensions to the sewerage, rendered necessary by the rapid growth of the district. There was no opposition.

A boys' clubhouse in St. Werburgh's, Bristol, was formally opened on Saturday. The architects were Messrs. Paul and James, and the builders Messrs. Bennett, of Pennywell-road, Bristol.

STATUES, MEMORIALS, &c.

CADELEIGH, DEVON.—In St. Bartholomew's Church, Cadeleigh, has just been restored a very fine specimen of Jacobean sculpture. Under a richly-wrought canopy are two recumbent effigies of Sir Symon and Lady Leach (of 1700) and kneeling figures of their nine children. The inscription is as follows:—"Here lye the bodies of S. Symon Leach, Knight, son of Symon Leach, of Crediton, and of Lady Catherin Leach, his wife, daughter of Nicholas Tuberville, of Crediton, Esq., whose true affection in religious wedlock caused their desire to make their bed together in the dust." In March, 1901, Mr. Prescott Row, secretary of the Homeland Association, heard by accident that the monument, which was tottering to its fall, was about to be removed from the church. He wrote to the daily Press suggesting that it would be an act of vandalism for so remarkable an example of Jacobean work to be destroyed. The appeal met with a response; but it was not till last week that the restoration was completed. While the work was in progress two sculptured figures, supposed to represent St. Bartholomew, were discovered in the walls of the tower.

CHIPS.

Sir Henry Thompson formally inaugurated on Wednesday a new crematorium which has been constructed at Perry Barr, on the outskirts of Birmingham. Messrs. Bateman and Bateman, of Birmingham, are the architects.

The Earl of Northbrook opened on Wednesday at Christchurch, Hants, the new Technical Schools, built as a memorial to Queen Victoria.

The portrait of Sir John McDougall, who was Chairman of the London County Council during 1902-3, will be presented at the County Hall, Spring Gardens, on Tuesday next, at half-past two, by his colleagues, members of the Council. The portrait is by Mr. J. Spencer Watson.

The Epping Forest Committee of the Corporation will proceed to-morrow (Saturday) to the Forest. Among the works to be inspected are a proposed widening of a roadway at Hile End, the widening of Chingford-road, and the progress of the operations at Hollow Pond.

The unveiling of the Kensit Memorial at Hampstead Cemetery, which has been erected by the London Council of United Protestant Societies, will take place to-morrow, Saturday, at 3 p.m. The memorial is in the form of a plain obelisk, cut from Peterhead granite, and stands about 16ft. high.

The Board of Trade have recently confirmed the following Light Railway Order made by the Light Railway Commissioners—viz., the Llandudno and Colwyn Bay Light Railway (Deviation and Amendment) Order, 1903, amending the Llandudno and Colwyn Bay Light Railway Order, 1893.

The City Corporation has agreed to plans for the building of a crematorium at the City of London Cemetery at Ilford, at a cost of £7,000. The foundation-stone will be laid by Mr. R. W. Edwards, chairman of the Sanitary Committee, on Wednesday next.

The recently-opened Pankhurst Hall in St. James'-road, Hightown, was on Monday the scene of an interesting gathering. Some mural decorations have been done by Miss Pankhurst, and their completion was made the occasion of an address by Mr. Walter Crane. Emblems of the future and of the ideal have been chosen in working out the scheme of decoration. The entrance-hall is adorned with adaptations of the peacock's feather, the lily, and the rose; and the name of the hall is given in decorative lettering. Roses and clove-apple trees for knowledge and doves for peace are the symbolic features in the large hall.

The urban district council of Oakengates have instructed Mr. R. E. W. Barrington, M.Inst.C.E., to proceed with the carrying out of a new sewerage scheme, and have accepted the tender of Mr. H. Holloway, Wolverhampton, at £7,897.

The tramway system at Gateshead has just been extended from Sheriff Hill to Wrekenton, a distance of 1½ mile. Mr. H. Howley has acted as managing engineer, and Mr. Thompson as resident engineer. The Board of Trade inspection prior to opening was held by Colonel Von Donop on Friday. The permanent way contract was performed by Mr. J. J. Robson, the overhead work being done by the company under the superintendence of Mr. P. Shannon. The extension has cost nearly £10,000.

California redwood has been found useful in the construction of the big pipes used for the conveyance of water to many of the electric power houses in the northern part of the State. These pipes are built up and banded. They cost less than metal pipes, and are more durable. Redwood outlives all other woods when kept constantly moist. Moreover, it burns much more slowly than any other kind of timber used for building purposes, as it contains no inflammable oil or resin.

A Local Government Board inquiry was held at Hastings last week into the application of the town council for permission to borrow £2,059 for sewerage works, £250 for electric lighting, and £138 for street improvements.

The directors of the Manchester, South Junction, and Altrincham Railway Co. have under consideration the electrification of their line, which connects Manchester with Bowdon. Plans and specifications are being prepared, and on the acceptance of the estimates the work will be proceeded with without delay.

The Bishop of Worcester, on Saturday, dedicated the new church of the Ascension at Newtown, Malvern, erected by Mrs. Livingstone to the memory of her husband. The style is Early English. The nave and choir will accommodate a congregation of about 400. The tower contains a baptistry, organ chamber, and belfry, in its three successive stages. Externally, on the western side, is a sculptural representation of the Ascension. The instructions of the donor to the architect were that the very best of materials should be used throughout.

Mr. Henry Patteson, of Middleton Lodge, Kantsford, and of J. and H. Patteson, 36, Oxford-street, Manchester, marble merchants, who died on August 20 last, aged 32 years, left estate valued at £13,238 gross and at £12,493 net.

At the last meeting of the city council of Hull it was decided to proceed forthwith with the town-hall, a proposal to adjourn consideration of the question for twelve months being defeated by 23 to 26 votes.

The bust of the late Right Hon. Cecil Rhodes, executed for the City Corporation by Mr. H. A. Pegram, was unveiled at the last meeting of the Court of Common Council. It will be placed permanently in the Lobby of the Guildhall.

The work in connection with the erection of a new bridge across the river Tay at Kinclaven has been in progress for some weeks past. The bridge will consist of six concrete arches, with stone facings and parapets, and concrete coping, and will have a roadway 16ft. wide. The plans are by Mr. Harrison, C.E., and advice in their preparation was given by Sir John Wolfe Barry. The contractors are Messrs. Young, Limited, Glasgow. The bridge is estimated to cost about £3,000, of which sum the Perth County Council have subscribed £2,600.

On Saturday at St. George's, Edgbaston, the vicar dedicated a new stained-glass window to the memory of the late Mr. and Mrs. J. D. Goodman. The window has been erected at the east end of the north aisle, and is the work of Mr. C. E. Kempe, of London. The design is "The Tree of Jesse"—or a representation of the genealogy of our Lord as recorded in the 1st chapter of St. Matthew, showing the fulfilment of the prophecy of His birth, of the house and lineage of David.

Another section of the restoration of the Great Priory Church of Wymondham, Norfolk, was reached during last week, when the long-silent peal of bells in the 15th century western tower was reopened. Three new bells have been provided, and one which was cracked has been recast, the peal now consisting of an octave. The casting has been carried out by Messrs. Mears and Sainbank, of Whitechapel, and the rehanging was executed by Messrs. Day, of Eye, Suffolk.

Mr. Andrew Carnegie has promised to bear the cost, which is estimated at £15,750, of a library to be erected at West Derby, Liverpool.

At the last meeting of the Drapers' Chamber of Trade the secretary reported that he had received two letters from the clerk of the London County Council asking if the Chamber had any suggestions to make with respect to the proposed general amendment of the London Building Acts. The meeting referred the letters to the Parliamentary committee.

Mr. W. A. Dacat, Local Government Board inspector, held an inquiry at Wallend on Friday regarding an application of the corporation for sanction to borrow £24,177 ls. 10d. for the purposes of the main road and private street improvements.

During the year 1902, 566 miles were added to the railway system of India, bringing the total mileage open at the close of the year up to 25,931. The addition between January 1 and April 30, 1903, of 630 miles increased the total on May 1, 1903, to 26,561 miles, of which 14,346 miles were on the 5ft. 6in. gauge, 11,247 on the metre or 3ft. 3½in. gauge, and 968 miles on the narrower gauges.

The inaugural meeting of the Surveyors' Institution for the session 1903-4 will be held on Monday evening, November 9, at 8 p.m., when the President Mr. Albert Bucknill, delivered an opening address.

The town council of Macclesfield have adopted the scheme of Mr. R. E. W. Barrington, M.Inst.C.E., of Westminster and Wolverhampton, for the improvement of their sewage disposal works at a cost of about £14,000.

Our Office Table.

PROFESSOR BERESFORD PITE, F.R.I.B.A., delivered at the Leicester Municipal School Art, on the 25th ult., the first of a course of lectures on architecture. He urged on students the importance of endeavouring to think out their problems for themselves, and to dismiss from their minds all prejudices as to style. He proceeded to treat the development of architecture, or rather of "building art," rapidly sketching the process of evolution, as exemplified in the work of the Egyptians, the Greeks, and the Romans. In conclusion he pointed out that English ideas in architecture were crystallised through the influence of Italian priests and bishops, and through the impressions brought home by pilgrims to the East. In conclusion he pointed out that there was without doubt a canon of proportion, adherence to which produced results that were satisfactory, and whatever views students might hold as to proportion in design they would find that they could not vary with safety the proportions laid down ages since by Vitruvius.

THE Metropolitan Water Board, at a meeting on Friday, considered the report of the special arbitration committee, which recommended that, if possible, an agreement should be come to with the Tottenham and Enfield Urban District Councils and other minor urban authorities so as to save much of the expense that would be incurred if the claims and liabilities of these bodies had to be settled by arbitration. The report also recommended approval of an estimate of £14,000, further expenditure likely to be incurred in connection with the arbitration proceedings. The report was received and its recommendations were approved.

THE Asylums Committee of the London County Council, in their fourteenth annual report for the year ended March 31, 1903, state that they have once more to chronicle a large increase in the number of certified lunatics. The disaster at Colney Hatch Asylum, when 51 inmates lost their lives, is thus referred to:—"The fire at Colney Hatch Asylum on January 27, 1903, deprived us of accommodation for 300 female patients. The total destruction of the annexe demonstrated the danger attaching to temporary structures of this nature. We have only one other structure built of entirely similar materials—viz., the annexe at Banstead Asylum (the Manor Asylum and the Haswell annexe being plaster lined). With the approval of the Commissioners in Lunacy and the Home Secretary we have made alterations in the connecting corridors and otherwise at these buildings which, we hope and believe, will reduce to a minimum any danger in case of fire. We desire here to record our appreciation of the kindness of the Metropolitan Asylums Board in spontaneously placing 198 beds, mostly at their newly-opened asylum at Tooting Bec, at our disposal immediately after the Colney Hatch fire."

THE deputation from Germany, representing the Central Benevolent Institution for Workmen in that country, visited Liverpool on Friday and Saturday for the purpose of gathering information regarding the housing of the working classes in the city and neighbourhood. They were taken charge of by the housing committee of the corporation, whose officials made arrangements for them to inspect several institutions of interest, as well as to see what the corporation have accomplished in the way of providing accommodation for people who have been dispossessed from insanitary dwellings. On Friday they visited Messrs. Lever Brothers' model village of Port Sunlight, and viewed houses provided by the firm's employees and also the many and varied forms of recreation placed at their disposal. A tour of the soapworks was further included in the programme, the deputation being subsequently entertained to luncheon. Subsequently the deputation proceeded to the Home for Aged Mariners, situated on the Cheshire shore of the Mersey at Egremont, and on returning to Liverpool paid visits of inspection to the corporation washhouses at Burroughs-gardens, where they were received by Mr. W. R. Court, the corporation's engineer and chief superintendent of baths, and to the Bevington House Hotel, an institution conducted on the lines of the Rowton Houses in London. Saturday was devoted to visiting the artisans' dwellings erected by the corporation in several districts, known locally as the demolition areas. A visit was also paid to the sterilised milk depot conducted under the management of the corporation.

The deputation were afterwards entertained to luncheon by the Housing Committee, and later in the afternoon they left for Glasgow.

AT Morley Memorial College, Waterloo-road, S.E., a series of eight lectures on the development of English Gothic architecture, illustrated by lantern views, plans, and diagrams, is being given on Monday evenings in connection with the Archeological Society. The introductory address was delivered on Monday evening by Mr. E. W. Harvey Piper, who took as his subject "Norwich Cathedral," with special reference to the discoveries made during the recent works of reparation. Mr. F. W. Reader occupied the chair. The second lecture will be given by Mr. C. H. Dedman on Monday week, the 19th inst., his topic being "The West Fronts of Our Cathedrals," and these will be followed by a half a dozen addresses by Mr. Ernest Godman, architect, the secretary to the Survey Committee of London, who will trace the growth of English architecture from the 11th to the 16th centuries. Saturday afternoon visits are to be paid by the members, under the conduct of Mr. Godman, to the churches of St. Bartholomew the Great, Smithfield; St. Saviour, Southwark; St. Etheldreda, Ely-place; and All Hallows, Barking.

ARE contractors justified in employing female labour on engineering operations? Considerable discussion took place on Monday at a meeting of Dundee Harbour Board over the employment of women at the works in connection with the reconstruction of the eastern wharf. A sub-committee reported that, in view of the conditions of the labour and the opinion of the legal adviser of the Board that there was no clause in the specifications to prevent the contractors, Messrs. Best and Co., Leith, from employing any kind of labour they chose, they saw no cause to interfere. Billie Melville moved the disapproval of the report, on the ground that the contract did explicitly state that men were to be employed, and also because he held the work was entirely men's work. He was certain that the only consideration which entered into the minds of the contractors for the employment of women instead of men at a particular section of the work was that they could get women at considerably less wages than they would have to pay to men. The difference between the wages of the women and what would have had to be paid had men been employed simply went to make up extra profit to the contractors. Billie Robertson, in seconding the disapproval of the report, said he was sure the engineer had never contemplated the employment of women on the works. Mr. Andrew Leitch supported the committee's recommendation, remarking that the kind of labour at which the women were engaged was far more suitable for them than most of the employment in their mills and factories. They were powerless, by the terms of the contract, to interfere, and they must just see that in future no female labour could be employed. Sir James Low remarked that any citizen going down and watching what kind of work the women had to do must admit that the work was entirely within their scope. The work was not for men, but boys; but, unfortunately, in Dundee, it was exceedingly difficult to get boys to be steady at work. He fancied the reason the contractors had preferred women was because they were much steadier in their habits than the boys one sometimes got in Dundee. By 17 votes to 5 the report of the committee was approved.

MR. RICHARD BELL, M.P., presided at the first ordinary general meeting of the North Wales Quarries, Ltd., held at the Co-operative Hall, Derby, on Saturday afternoon. The directors, in their report, stated that the society took over the Pantdrcinirg quarries on Aug. 1, and at that time there were 108 men employed there. These were engaged for the purpose of assisting the men who were out of work. At the present moment there were 195 men employed there, and it was hoped to employ more immediately. There had been some little delay in negotiating the purchase of the Moel Faban Quarry, but it would be shortly completed. The third property, the Tan-y-bwlch quarry, near Bethesda, had passed into their hands that day on considerably better terms than were expected. The share capital up to the present was a little over £19,000, and the number of shareholders 687. From the day when the society took possession of the quarry the receipts from the sale of slates amounted to £1,271 18s., but that did not include the rents of the cottages. The expenses for the same period

were £1,192 2s. 6d., leaving the net profits for the two months £79 15s. 6d. The profits would have been larger but for the fact that the quarries had been flooded ten days. The report was adopted, and the directors and auditors re-elected, whilst Mr. J. Wilson, M.P., and Mr. Guinness were appointed to represent the shareholders on the Board of Conciliation that is to be formed to consider disputes between the society and the workmen.

ACCORDING to a report submitted to the county council of Perthshire by the road surveyor, the roads in the western district of that county are deplorably narrow. The reference arose from the requirements of the recently-passed Motor Car Act, and the road surveyor stated that the total mileage of roads in the western district was 267, and the average width 13ft. The length of roads on which motor-cars might travel at a rate not exceeding twenty miles was 55, their width being 17ft. The length of roads on which the speed would require to be restricted was 99 miles, and the average width 12ft. The length of roads that would be closed to motor-cars was 112 miles, with an average width of 10ft. It was agreed to defer consideration of the report until a special meeting, the road maintenance committee, in the meantime, to obtain full information on the subject.

THE cathedral at Meissen, in Saxony, has just escaped from a grave danger, no less than that of being restored according to the latest canons of Teutonic architecture. At a Congress held in Erfurt lately, dealing with the preservation of national monuments, the scheme was broached, and but for what appears an actual intervention of Providence would have been agreed to there and then. Professor Cornelius Gurlitt, of Dresden, in the course of a speech declared that while in Germany they believed that they had elevated the science of "restoration" to incomparable heights, there were those in other countries, among them "the Union of British Architects"—a body by the way, not easily identified under that misnomer—who maintained precisely opposite views. He proposed heroic measures to decide the question for ever—no less than the restoration of Meissen Cathedral, a 15th-century marvel, which he had personally closely studied. Unfortunately, in the course of his remarks Professor Gurlitt fell foul of another authority, Herr Oberbaurath Schaefer, of Karlsruhe, whom he accused of negligence, presumption, and a dismal tendency towards "embellishing" according to his own ideas whatever was intrusted to him. The outraged architect defended himself vigorously, carrying the war into the enemy's country by the assertion that he was well aware of Professor Gurlitt's envious hatred, and that he had received from a news agency 1,400 newspaper articles attacking him, all of which, as he knew by their style, had been written by the professor himself. Great uproar arose, the assembly took sides with one or the other, and the cathedral of Meissen was forgotten.

THE famous Eiffel Tower is to disappear. The municipal committee of "Old Paris" has decreed that the huge structure shall be pulled down at the expiration, in 1910, of the concession held by the Eiffel Tower Company. Various schemes are now on foot for removing the edifice to some other place. It has even been proposed that it shall be acquired by the State, and set up somewhere on the French coast to act as a sort of gigantic lighthouse. The alternative is to sell the tower to some foreign capitalist.

A VERY useful new illustrated pamphlet, showing various applications of Uralite, has been issued by the British Uralite Co., Ltd., 50, Cannon-street, London, E.C. The uses of this material are certainly co-extensive with almost every branch of construction and manufacture. For roofing it is unequalled. For fire-resisting doors, in the rapid erection of buildings quickly wanted, it has few rivals. For insulation purposes it offers extraordinary advantages. In breweries, malt kilns, and similar structures it prevents condensation, and is acid proof; and in hospital construction it secures cheap and certain guarantees against infection.

AT a meeting held recently in the City Chambers of Glasgow, Bailie Bilsland and Mr. James Paton, F.L.S., convener and superintendent of the local museums and art galleries, met several representatives from the University and the large shipbuilding and engineering firms, to discuss with them the best means of promoting the forthcoming Naval and Engineering Exhibi-

tion at the People's Palace, Glasgow. Owing to restricted space, it was unanimously agreed to make a special effort to have the exhibition as much as possible an amateurs' and workmen's show, without calling upon large firms for exhibits, unless absolutely necessary to do so. Fifty pounds will be awarded, besides certificates of merit, for models in the competition section.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY.—Architectural Association School of Design. Preliminary Meeting. Addresses by Walter Cave and J. S. Gibson. 9, Conduit-street. 7 p.m.

WEDNESDAY.—Architectural Association Camera Club. "Little Known Irish Abbots," by C. H. Oakden, F.R.P.S., 59, Great Marlborough-street, W. 7.30 p.m.

THURSDAY.—Shetheld Society of Architects and Surveyors. Presidential Address by T. Winder, A.M.I.C.E.

FRIDAY.—Architectural Association. "The Day School in Relation to Architectural Pupilage," by A. T. Bolton and H. P. G. Maule, 9, Conduit-street. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

OCTOBER 13th. PRELIMINARY MEETING OF THE SCHOOL OF DESIGN at No. 9, Conduit-street, W., at 7 p.m., when ADVERTISEMENTS to the Students will be delivered by Messrs. WALTER CAVE and J. S. GIBSON. Any member may attend without payment of the School of Design fee.

OCTOBER 14th. ORDINARY GENERAL MEETING at No. 9, Conduit-street, W., at 7.30 p.m. PAPERS by Messrs. ARTHUR T. BOLTON and H. P. G. MAULE on "The Day School in Relation to Architectural Pupilage." Exhibition of Drawings by Day School Students.

LOUIS AMBLER } Hon. Secs.

CHIPS.

A site of about an acre in extent has been secured, at a cost of £3,000, in Tyndall's Park, Bristol, for the new Baptist College for the West of England. The present building at Stokes Croft is said to have been erected from plans originally designed for Dartmoor Prison.

Colonel Von Donop made an inspection on Friday of the new tramways recently laid down by the Newcastle-on-Tyne Corporation at Benwell, from the toll-gate to Condercum-road, on the Elswick-road and Westgate routes; also from the Byker car-depot to the Wallend terminus; and also the extension from the Stack Hotel to a point near the railway station at Low Walker.

The Leeds Corporation is seeking powers to borrow £220,000 for electric lighting purposes.

The inauguration of the Bexley Urban District Council's electric lighting and tramway schemes took place on Thursday. About £100,000 has been expended on the scheme. There are 5½ miles of tramways. They extend from the terminus of the Woolwich and South-East London tramway at Plumstead, and traverse the Old Dover-road, through Bexley Heath to the Dartford Rural Council's boundary, and branch off to the left to the boundary of Erith parish, thus supplying connections for future tramways in these two directions.

The new city museum at Winchester will be opened by the Mayor on Thursday next the 15th inst. It is situated in the Square, and has been built by Messrs. Coston from plans by Messrs. Missett and Farrow, all of Winchester.

Bishop Taylor-Smith, Chaplain-General to the Forces, dedicated on Sunday a marble pavement, a reredos, and Holy Table in Christ Church, Royal Military College, Sandhurst, to the memory of former cadets of the college who fell in South Africa. The reredos and Holy Table are of oak. On the reredos are carved the figures of Christ and St. George, St. Michael, Gideon, and Joshua. The pavement is mosaic marble. Besides these memorials are eight small tablets and three large ones bearing the names of 272 former cadets of the college who fell in South Africa. Among them is the name of Lord Roberts's son.

Mr. F. Tulloch held a Local Government Board inquiry at Harrogate on Friday, relative to the application of the town council to borrow £1,450 for the purchase of land at Stonefall for a cemetery; and also respecting the application to borrow £1,750 for the purchase by the Corporation of the Harrogate Swimming Baths, previously owned by a private company.

Ripon City Council has decided to borrow £5,300 for the erection of baths in connection with the Sap scheme.

A new altar, dedicated to the Sacred Heart, was formally unveiled on Sunday at St. Alban's Roman Catholic Church, Blackburn. The altar, besides the lower part of the reredos, is composed of Sicilian white marble, relieved with rouge marble, and comes from the studio of Mr. E. J. Pappet, of Birmingham. The altar cost £400.

Trade News.

WAGES MOVEMENTS.

TRADE PROSPECTS IN WESTERN AUSTRALIA AND NEW ZEALAND.—The October circular of the Emigrants' Information Office states that returns from the various districts of Western Australia for the quarter ending June 30 last show that the only demands for labour then were as follows:—For mechanics in the building and other trades at Northam, for men in the building trades only at Guildford and Bunbury, and for carpenters on the Murchison goldfields. The last reports from New Zealand show that nearly every trade was well employed. There is a good opening for competent carpenters, bricklayers, painters, plumbers, saw-millers, plasterers, sash and door makers, turners, and gasfitters.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2545.

FRIDAY, OCTOBER 16, 1903.

STREET FACADES.

THE clearing of a large area of old buildings between the Strand and Clare Market for the formation of the new crescent called "Aldwych," the pulling down of many old and interesting brick houses in New Inn, and the gradual rebuilding on the old sites of palatial structures for public and business purposes, present to the mind of the profession many problems of more than passing interest. The most obvious question that will arise in the architect's mind will be, What will be the effect of the scheme? Will it be so immeasurably superior to the old order of building that the great outlay will be compensated by the greater convenience obtained by the public? As a means of uniting the great thoroughfare of Holborn with the Strand, and forming an approach northwards, no one can dispute the usefulness of the scheme, especially when at the same time it has cleared a site crowded with unhealthy dwellings and tenements, and will, by adding to the area of new roadways, enlarge the breathing space in so important a centre. If we were to take the pre-existing plan of the neighbourhood north of the Strand at this point, and compare the map of closely-packed houses with the area thrown open in the new crescent and the new thoroughfare of Kingsway going northwards, it would be seen that a large percentage of the cleared area is open to the public, and will remain so—several acres of space, in fact, are added. This alone must increase the healthfulness and salubrity of the Strand and its neighbourhood. There will be, as a consequence, more sunlight and air distributed over a large area. These physical advantages of the new scheme are great, but they are not all. We have reason for hoping that the new arrangement will enable us to improve the architecture of this portion of the Strand. We are justified in hoping that such a wholesale demolition of undesirable property will be succeeded by a reconstruction worthy of the Metropolis, and of our era—that the new sites will be occupied by buildings of architectural character and dignity which will reflect credit on the municipal administration and the nation. Such a hope is not extravagant after so many admitted failures, which ought to have taught us something. We are not in the secrets of the committee intrusted with the practical development of the scheme, but the experience which they have had, the suggestions that have been made, and the result of the competition which they promoted ought to guarantee to the public frontages towards the Strand and Aldwych worthy of the best architectural skill. We have yet only two contributions to the main frontage, and these are far apart, both locally and architecturally. One "unique" position is advertised on a large board at the eastern end of Aldwych as worthy to be filled by an important edifice, and several other sites are open along the crescent and its junction with "Kingsway." To the architectural mind there are certain questions of considerable moment. The unique opportunity of rebuilding a considerable part of the Strand, and designing one extensive frontage to that thoroughfare, raises the question of the claims of a formal style of architecture. The subject may be looked at both from the occupant's and from the outsider's standpoint. By the former the house, as a unit, is regarded as the logical outcome of the individual requirements; the need of the tenant finds its own

expression in each street front. It shapes itself from within as a natural organic form does, and its development is one with the perfection of its outward form. So says Coleridge: "Each exterior is the physiognomy of the being within." There is reason in this view of the case: two individuals will have differently-expressed exteriors side by side; both houses are well expressed, but irregular, and the whole elevation or *ensemble* of a street so made up is an irregular sequence. Nearly all our streets are illustrations of this law of organic growth from within. Their very diversity is charming and picturesque, for they present the variation of human life and habits and character. The author of a paper on this subject, read before the Institute some time ago, discusses the question from both sides. He says, advocating the formalist's view, "the street passenger is in much the same position with regard to the street wall dividing him from the man in the house as an adjoining owner with regard to the party-wall. In the latter case the law recognises right of joint ownership, and in the former case street passengers might fairly claim to exercise certain rights over a moiety at least of the front wall, and if their claim were admitted the overwhelming suffrage of the street folk would impose an architecture conforming truly *usui civium*. Irregularity would be confined to the inside of houses; then would street architecture be formal." This argument assumes that "within" and "without" are relative terms, and that the man in the street is the "being within," for he is beyond the walls that flank the street. This is rather straining the argument from a purely practical point of view, yet in one way at least we must confess that the man in the street has a better right to appreciate street architecture than the man in the house, who in this argument is the "outsider." The tenant regards the house only in its immediate surroundings and relation to himself; while the man in the street can see the whole.

There are several arguments used against formal treatment which we may just glance at. Those who prefer the irregular in street building disclaim any intention of breaking through legislative enactments or rules of convenience. Thus they refer to the frontage lines of houses prescribed by the Act, to straight lines of front, to the limitation of height, avoidance of projecting features, &c. But these matters of regularity and economy in building rather point to the advantages of formal architecture, with which they are in antagonism. Again, it is argued the formal treatment discourages the convenience of tenants, and would impose on them stereotyped arrangements quite subversive of individual wants and trades, therefore it is charged with falseness and hypocrisy; but these charges may be refuted by an appeal to Nature herself, which the advocates of irregularity are constantly bringing to support their ideas. The duality of the functions of the human body and its symmetry, the structure and functions of plant life, contradict the doctrine that every part of a structure must express externally its use. Nature at least shows us in many organic forms symmetry and regularity of features which are not always the result of use, and which are really as formal in arrangement as any building can show. On the other side, we have to consider the architecture of our streets from the point of view of the outsider. As we understand that individual, he looks at the external appearance, and does not trouble much about the inside convenience of the houses which compose the street. The public, whom the man in the street represents, look for character, for an expression of building which exhibits a breadth and largeness of character, for something that transcends the mere individual tenant, which exhibits architectural unity, rhythm, and dignity, and from this point of

view there is much to be said. The "irregular" or individualistic idea of architectural design is comparable to the analogous theory of individualism which ascribes all progress to individual exertion rather than to the society; but the formal theory of design expresses the broader view of social well-being, in which the community is the unit instead of the individual. It is, in a word, collective and national in its aims. The irregular style is based, as we have seen, in the individual growth of within outwards. The "use" of the building is the chief motive in the design; but if this is so, a building designed for one purpose, like a shop, should always remain the same. Directly it changed hands the design would, according to this theory, be wrong, inconsistent, and untrue. But we cannot be always changing the front directly another trade comes to occupy the house. This would be costly and needless expense, so that this theory does not work. It is not logical. We cannot be always putting a new front on our building directly it changes hands, or is used for some other purpose. Yet this is the theory of variable "use" which the advocates of irregularity contend for. The formal system of design is more consistent. It is based, not on the mere accident of a certain use, but on a broad tendency which is more uniform. We can illustrate this by referring to certain localities in London to which certain trades and industries gravitate. Thus we see Long Acre used by carriage builders, Bond-street by picture galleries, Regent-street by various fancy trades, drapery, millinery, and jewelry, and other localities are associated with businesses and trades of particular kinds. In each of these we shall find the formal treatment of façade more general. One common objection to formal design is that it is dull and monotonous, and without character. But it need not be so. We do not wish to see reproduced the street design of Regent-street, Gower-street, and other parts of Bloomsbury, where one house is exactly a repeat of another. The President of the Manchester Society of Architects, Mr. J. W. Beaumont, spoke in his address of the value of variety in street architecture; but he also dwelt on harmony, and the necessity for control. Formal design does not imply mechanical repetition, yet we may desire to see a general character given to a street, instead of making it a collection of diverse units of odds and ends. Certain trades and occupations have the tendency, as we have said, of localising in particular streets; but they would not do so very readily if irregular street architecture was the fashion, and any pronounced street fronts were built. The tendency of street building is towards a formal treatment, as we may see in all large towns where a character for respectability prevails. No one likes to appear eccentric just for the sake of eccentricity. There is something imposing in formality, for it enables the artist to gather up his forces and present them united as a phalanx; the ordinary features, such as windows, are repeated with telling effect in a great length of façade which by themselves are very insignificant; and this effect is increased when the architect varies his masses, or repeats at intervals a feature like a pediment, a dome, or a colonnade, or a break, and crowns the extremities by pavilions or cupolas. There is also a consideration for others which it expresses externally. The passer-by in the street is not concerned to know every tenant's trade, or taste, or eccentricity; for him at least there should be a complacent manner—a kind of "politeness," or etiquette, that is expected by the outsider to whom we wish to show respect. The formal design expresses just such a complimentary way of consulting the tastes and feelings of others. So the architect, in adopting the formal or ceremonious method of design, will not disregard the larger city, the feelings of others

who are constantly using and parading the street; he will not purposely accentuate the disagreements of adjoining owners who like to proclaim their individual tastes in the most offensive manner. These are a few of the advantages of the formal method of design. But do not the qualities of unity, rhythm, order, and symmetry count for something as well? Compare Paris before Napoleon III. began its remodelling with its streets and boulevards now; we have lost a great deal of picturesque irregularity that made "Old London" so charming to the artist, but have we not gained by wider streets and promenades, safer and better construction and regularity?

There are certain recurring features in the formal style which deserve to be noticed. The dome or cupola is one of the most important; but its employment ought always to mark either the centre or termination or some other prominent position in the plan. We can tolerate it in the centre of a long façade over the hall or vestibule, or on salient angles of wings; but the modern professor often introduces it in all sorts of places just as an ornament, or to give height and prominence. In a large number of instances its introduction conceals poverty of design. It is so easy in a long façade to stick on a cupola at each corner, and to flank every projecting entrance with small cupolas. The mansard or pavilion roof is another feature which the modern architect affects; but, like the dome, it can be used too often and without any motive. Replicas of the Louvre on a small scale and for ordinary purposes might easily be made grotesque and provoke a smile, in the same way the tail Mansard roof may become a ridiculous travesty when placed on certain street façades at intervals. Just now there is a craze for corner cupolas in streets. When tastefully designed, and in keeping with the building, they are pleasing breaks to the skyline, and serve to accentuate the entrance; but we may have too many of them, and then they look pretentious and self-assertive. The colonnade is a feature which is also used to give variety to a long façade, and when adorning a building of some magnitude is an imposing alternative. On the other hand, it may become positively ridiculous when applied to a small building or an insignificant row of houses, in the same manner as the dome may look grotesque when placed on a small building. The colonnade, by relieving the front of a building, or used as it is on the Embankment front of Somerset House, or in the Louvre, in the upper story at intervals between the plainer portions of the façade, adds greatly to the general effect. In the new Gaiety in the Strand it has made a pleasing relief to a solid and bare substructure, but we refer mainly to its value as a feature in street composition. In southern aspects the colonnade, or a screen of columns before the plane of wall pierced by windows, may be found of service even in this northern clime if the wall front is not too much recessed, so as to cast a deep shadow. In view of the new Strand frontage these considerations are worth attention.

Several important buildings will shortly be erected in close proximity to the new Gaiety. A large block of buildings in Aldwych is to be built near the Gaiety, comprising the Waldorf Hotel, Mr. E. G. Saunders's new theatre, also to be known as the Waldorf, and a playhouse for Mr. Murray Carson. The excavations have been in progress, and a large area, it is stated 26ft. deep, 120ft. long, and 70ft. wide, has been made for the underground grill-room of the hotel. The frontage of this block will be 470ft. in length, and the hotel will be situated between the two theatres. We understand Mr. A. Marshall Mackenzie is the architect for the hotel, which will be in the Louis XV. style. The stone front will have a colonnade and two balconies, and will be flanked by towers. A row of

shops will occupy the ground story. The hotel will contain 350 rooms, with baths to each suite. A terrace lounge and garden form part of the design. The theatres are from the designs of Mr. W. G. R. Sprague, and will be in the Italian Renaissance style. The buildings will cost about £500,000.

Attention has been drawn by Mr. Mark H. Judge, in the *Times* of last Monday, to the memorial of the Further Strand Improvement Committee about to be presented to the London County Council, in which the committee support the proposal to set back the eastern horn of the crescent of Aldwych in line with the western horn (on which the New Gaiety stands), and thus give the roadway its natural course to the Law Courts, which deviation will bring the church of St. Mary-le-Strand into line with the thoroughfare, and will provide an island pavement where trees could be planted. The proposals can be secured, it is stated, by a sacrifice of about 85ft. of building frontage. The new thoroughfare running in a northerly direction from the centre of Aldwych, called the "Kingsway," is also making progress, and already the operation of widening the streets at the northern end is begun, and will give some idea of the promenade. Will the architecture of this fine thoroughfare, the most important formed since the Thames Embankment, be equal to the opportunity? At present we have no means of ascertaining. Years will elapse before the public will be able to judge. As a perfectly straight route, the claims of a formal treatment of elevation will unquestionably be strong, yet we should be sorry to see a too rigid application of any one style; we look rather for a compromise between the formal and irregular style, in which both Classic and Gothic may find a suitable expression.

ADVICE TO STUDENTS.

ALREADY the architectural societies are astir, and one or two addresses of professional interest have been given. The President of the Architectural Association delivered a short address on a variety of educational topics, which was fully reported in our last issue. The acquisition of the Royal Architectural Museum and the adaptation of the premises to the requirements of the Association was dwelt upon with much satisfaction. It is true, as Mr. Henry T. Hare remarked, the Museum had become "out of sympathy with its environment"; but it was for a long time a witness to the enthusiasm of the Gothic Revival and its far-reaching consequences to the future of architecture. The collection of valuable casts which it contains must have had an educational use in the past, whatever may be said about such means of instruction. The reopening of the day-school of the Association after its first year's work is in itself a notable event. We lately referred to the programme of the courses given at the school, which ought to be welcomed by all pupils in offices, as well as those who are thinking of taking up architecture as a profession, and of enabling them to ascertain their capacity for entering it. The day-student is taught to take an intelligent interest in all that appertains to an architect's office, in building operations, in drawings of details, and other things which are often enigmas to the young beginner. Mr. Hare invited his hearers to inspect the results of the school for themselves, and the progress is said to be most encouraging; he commended it to all parents, guardians, and heads of public schools as a means of testing the aptitude of the student.

The President advised students to study and delineate ancient buildings. Facilities for the delineation of old work are more numerous than ever, easier and more rapid travel to all parts of the world, in which the cycle

and motor have their part, is obtainable. Kodaks and photographic reproductions are all inducements to the cultivation of this valuable means of instruction. We do not mean the only agencies, but still very important ones to the architectural student. No doubt years ago too much stress was laid on the value of drawing; it was regarded by many almost the end of the young architect's efforts that he should be an accomplished draughtsman. Opinions have changed very much since. Instead of being the end, it is now regarded only as a means of study. Every architect knows the great value of the accomplishment, but he knows also that it does not give the power to create new forms, nor to work out a problem in design. Mr. Hare suggests the "deliberate consideration of such studies as are the outcome of demonstration and experience, observation, and research, rather than the perusal of books and the abstract theories of mankind." The recommendation is one needed just now, when the student's attention is directed so much to book knowledge and theoretical instruction. Observation and research are invaluable means, and the President rightly points out the danger of the school usurping all the attention, the valuable work of the studio being neglected. The classroom, necessary as it is, cannot take the place of the workshop or the studio, where the student feels the directness of inspiration. The president also deplores the want of "brains" in the pursuit of architecture, and he says much of the failure which we see in our streets and cities is the result of "old rule-of-thumb processes which are preferred to new developments." Who can doubt this? We have too little of brains. The machinery, the provision of "battleships and big battalions" are useful, but nothing can be done without the organising power.

We commend also to the student the inaugural address on "Architectural Evolution," given at the opening of the London School of Architecture, University College, by Professor F. M. Simpson, which we printed last week. Professor Simpson takes up the work left by the late Professor Roger Smith, who zealously and enthusiastically laboured for students who were during the day engaged as pupils in offices. The pupilage system, as pointed out, is undergoing a change. Not many years ago the pupil learned, or was supposed to learn, everything during his term of articles, assisted by outside lectures, such as those of the School of Architecture which he cared to attend. But of course it was quite voluntary on the pupil's part. Pupilage was then the only method by which the student could be prepared for the profession; it is not so entirely now, though the system will continue, because, as the lecturer said, "only in an office can men get thoroughly in touch with actual practical problems, and learn the inner mysteries of their profession"; but in the future the student must be better equipped for his work in the office by a preliminary training. At the University School a more systematic course of instruction has been instituted. A course of training on the evolution of architecture appears to be an admirable and logical preparation. As Professor Simpson says, "it is not merely a matter of academic interest; it has a practical side, which is to trace the working of a man's mind in his work, to see how, observing the requirements of his time, and adapting himself to his materials, he took an idea from here and an inspiration from there, and so treated them as to give them new expression." The evolution of a style of architecture is really the actual process that ought to go on in the designer's mind. The historical evolution of architecture is well known to our readers; all styles form an unbroken sequence, or nearly so, and the lecturer pointed out how the Romans, not finding the Greek lintel sufficient for their wider and more comprehensive

requirements, adopted the Etruscan arch and their own native materials and cement, by which a concrete could be employed in the construction of arches and vaults which have never been surpassed. Again, we see evolution in the requirements of a rising Christianity, when temples and basilicas were converted into churches. The lecturer pointed out how the evolution or process of change was made step by step. "A wall was built between the columns of the external peristyle, so that the ambulatory became the aisles. Openings were pierced in the naos wall to connect the aisles with the nave, and a chancel was built out at the east end." The posticum of the temple became the porch of the church. So the colonnaded timber-roofed basilica of Rome became the model for the Christian church. Other notable instances of evolution are given, emphasising the fact that all architecture is evolved from previous efforts—that true originality of expression is not merely a fashion, or what is now called "Art Nouveau," but the outcome of previous knowledge and of earlier types. The architect of to-day has to conform to the same method, and to work with similar materials. "All he can do is to try and advance one step further than his predecessors; behind him is a vast store of accumulated treasures, and if he can extract a few of them and infuse into them his own spirit, his own individuality, he has done as much as anybody can expect to do." Some of our "advanced" school of designers may hesitate to acknowledge this statement; but it is confirmed by all former architecture, as in the evolution of one style of Gothic out of the previous one there was no bold departure between any two consecutive phases such as the Early English and Decorated, not even the Transition from Norman to Early English. The mistake of the modern professor of the art is to ignore the gradual evolution of one type from another by selecting a totally different style, and trying to make it suit modern requirements, an eclecticism based on archaeological reproduction and not on reasoning, on traditions learned through the schools instead of the practical requirements of material and use. Professor Simpson illustrates this by referring to the deadening effects of our revivals. He says: "The fine traditions started by Inigo Jones and continued by Wren and his followers were all destroyed by the two revivals of the last century." Again: The Cinquecentists "picked up anew the thread of Classic tradition, which, although entangled for centuries with other threads, had never been entirely lost in Italy. Their work, although not coming in natural sequence like the Byzantine, Romanesque, and Gothic, has still a place in the history of architectural evolution." In the last century, it must be confessed, men sacrificed everything to archaeological correctness, and even later we had the reign of the purists. But the Renaissance artists, like those before them, never allowed tradition to take the place of utility, nor did they abandon science, which had been advancing for centuries. These are the "notes" of the true evolution of architecture. Again, there must be conciliation between the opposite camps, as is pointed out; there must be agreement in essential conditions if the art is to make progress. The workman finds it difficult to obey two opposing schools or styles, and the chaos of our art during the last sixty years is a proof of the confusion. For a real advance, as the lecturer said, between architect, builder, and client harmony is essential. "It existed in the 18th century in England; it existed in the 15th century in Italy; it is the secret of strides made by architecture in the Middle Ages." The rival factions of Gothic and Classicism have to some extent disappeared, but "there are still Classicists, although there are no longer pedants, and there are still Roman-

ticists, although they have ceased to be mock-Medieval." A fusion between the two is the only hope for progress. There are a few signs of such a reconciliation, but the time is not yet. One school is ready to throw over all traditions and to begin afresh, basing their efforts on individual skill; but the results of their labour, though full of enthusiasm, are not satisfying; the opposite school is still intent on precedent in following traditions that are no longer consistent with modern requirements. We must look for a compromise between these hostile camps in which each agrees to work in harmony with the other.

ON BUILDING TIMBERS.—XXXIX.

THEORY OF MEASUREMENTS.

IN describing the wood to be used for the carpenter's work in some buildings, a common clause in specifications (e.g., Tite, Royal Exchange, 1841) was this: "The oak timber is to be of English growth, sound and well seasoned, cut die square, and free from sap and other defects." Though other timber is specified for the carpentry, not a word is said about how it should be sawn, and it is of quite as much importance that scantlings obtained from it should be cut die square; the omission was probably due to the fact that English oak was cut here from the round log, and the other timber was imported already sawn die square. Perhaps the introduction of steam sawing has to a great extent done away with the necessity of making provision of this kind in a specification, for timber converted by gang or circular-saws has much less chance of being cut out of square than logs opened by hand in a sawpit. Whether logs and deals with wane or defective angles can be said to be sawn die square is a question open to dispute, as trade custom, and law which holds that custom, to be reasonable, would probably decide in the affirmative. An architect should, therefore, protect his client by specifying that "all timber must be sawn die square, and measure, after sawing, the full dimensions hereinafter specified; scantlings with wane angles will not satisfy this description." When it is said that timbers are to be sawn die square, it is not meant that they should be actual squares on cross-section; it is only required that any adjoining faces of each piece of sawn wood should be die square, or at right angles with each other. As this description of sawing applies to roofing timbers, joists, plates, studs, and lintels, it follows that these pieces are what mathematicians call parallelepipeds. There are two definitions given of a parallelepiped, or parallelepipedon, namely that it is a solid contained by six planes, three of which are parallel to the other three, and also that it is contained under six parallelograms, the opposite of which are parallel and equal. It may also be said that this solid is a prism whose base is a parallelogram. A prism is a solid contained by planes, of which two that are opposite are equal, similar, and parallel, and all the rest parallelograms; a prism takes its name from the figure of its ends: hence there are triangular prisms, square prisms, pentagonal prisms, and so on. A right prism has its sides parallel to its ends, and an oblique prism is that which has the sides oblique to the ends. Whichever of the above descriptions may be adopted for building scantlings, or for what the Americans call "lumber," the object itself is more familiar to the builder than its name in geometry, and though it is not likely, even with our continuation schools and polytechnics, that a carpenter of the next generation will ask for a "parallelepipedon" instead of a "deal"; still it is necessary to use uncouth and unfamiliar names when formulating rules for ascertaining the true contents of the solids they stand for. All this knowledge may be considered superfluous; but the writer, who is no crank in pedantry, having stood shoulder to shoulder with working men all his life, sees the advisability of adapting scientific names for geometrical figures, as they may be applied generally to the various shapes of all materials used in building, and technical, popular names could not be so used, their signification being limited. For example, to fix a rule for finding the solid contents of a deal would seem to imply that the rule would not be applicable to a squared log, a door-step, or a block of stone; but when a rule is given for finding the solid contents of a

parallelepiped or any other figure, that rule may be applied to all material having the same figure. The contents of a solid does not depend on the material in it, but on the dimensions of its bounding surface or surfaces; hence solids are classified and named in geometry, and rules are given for ascertaining their contents without regard to the substances in them, or to their trade uses.

The contents of a parallelepiped are obtained by "multiplying the base by the altitude," that is, the area of the base by the height, both dimensions being all in feet or all in inches. Let it be required, for instance, to know the contents of a deal 12ft. long, 11in. wide, and 4in. deep. Here the base area is 44in. (11 by 4), and the height 144in. (12 by 12). The contents is therefore 6,336in. (44 by 144), which, being divided by twelve three times, to bring the inches to feet, gives 3ft. 8in., the content required. It is evident in this calculation that multiplying 12 by 12, and afterwards dividing by 12 and 12, is superfluous work, for these operations neutralise each other, and may be omitted; hence the content of any piece of wood 12ft. long may be obtained directly by dividing the area of the base in inches by 12, the length in feet. A wooden post is 12ft. long, and 9in. by 6in. square. What is its content? $9\text{in.} \times 6\text{in.} \div 12 = 4\text{ft. 6in.}$, the answer required. Again, a flitch of pitch-pine is 12ft. long and 19in. by 8in. square, what is its content? $19\text{in.} \times 8\text{in.} = 152\text{in.} \div 12 = 12\text{ft. 8in.}$, the content required. All these calculations may be performed mentally, and multiples of 12ft., as well as submultiples, may be calculated for in the same easy way. When the length is not 12ft., or any multiple of 12ft., the work is done thus:—Say, for example, it is required to find the content of a deal 17ft. long by 9in. wide and 6in. thick. Here the area of the base is 54in., and this multiplied by the length in inches 204 (17 \times 12) gives 11,016in., which divided by 12 three times gives 6ft. 4in. 6pt., the content required. In this calculation the process may be shortened by omitting the multiplication by 12 in the first part, and dividing the two 12's only in the latter part, thus: $17 \times 54 = 918 \div 12 = 76\text{ft. 6in.} \div 12 = 6\text{ft. 4in. 6pts}$. From this the following rule may be deduced:—To find the content of any piece of squared timber, divide the area of the base in inches by the length in feet, and the quotient divided by 144 will give the content required in feet and parts of a foot. In cross-multiplication the calculation would be performed in this way:—

17ft. 0in.
0 9
0 0
12 9 0
12 9 0
0 6 0
0 0 0
6 4 6 0
6ft. 4in. 6pt. 0sec.

By proportional parts the calculation is much shortened as follows: 17ft. \times 9in. is the same as 17ft. $\times \frac{3}{4}$ ft. = 12ft. 9in., and this again multiplied by 6in. is the same as being multiplied by $\frac{1}{2}$ ft., then 12ft. 9in. $\times \frac{1}{2}$ = 6ft. 4in. 6pt. Familiarity with these calculations will enable anyone after a little practice to curtail them considerably by various "short cuts," which will suggest themselves in the course of the work. A number of ready reckoners, "Hoppus" amongst them, have been compiled to give at a glance, or rather at two glances, the content of unequal-sided timber, and the method adopted is this. The "equivalent square" of any rectangle is first given in one series of tables, and the content of square timber of various lengths in another set of tables; hence, when the contents of any piece of timber are required, the equivalent square of its end section must first be found, and the contents, according to its length, will then be seen in another table. Take, for instance, the deal last mentioned: its end section is 9in. by 6in., and its area 54in., the square root of which, $\sqrt{54}$, gives the side of its equivalent square, or $7\frac{1}{4}$, as Hoppus puts it; opposite 17 in the $7\frac{1}{4}$ in. column of Hoppus's "Cubical Measure," is 6ft. 2in. 5pt., the content required. In these tables the $7\frac{1}{4}$ is approximate (for $\sqrt{54}$ is not $\frac{1}{4}$), and the content is also approximate, being 2in. and 1pt. short. The advantage gained by reducing rectangular areas to their equivalent squares is that a much shorter table is required to ascertain the contents, for the

square "7 in." will do for 9 in. by 6 in. stuff, as has been shown; and it will also answer for 12 in. by 4 in., 18 in. by 3 in., and other sizes also. Where accuracy is required, this method of calculating content of equivalent squares must not be used—in fact, it may be said that it is a rough-and-ready way, for those who are ignorant of the simple rules of arithmetic, to find the content approximately of any block of wood or stone. When the sides of a piece of timber taper regularly it is a frustum of a pyramid. A pyramid is a solid having any plane figure for its base, and its sides triangles whose vertices all meet in a point called the vertex of the pyramid, the base of each triangle being the sides of the plane base of the pyramid. A pyramid is also defined to be a solid contained by a plane polygonal base and other planes meeting in a point. Pyramids are triangular, quadrangular, pentagonal, &c., according as the base is a triangle, a quadrangle, or a pentagon. A cone is a round pyramid: that is, one having an infinite number of sides. The quadrangular pyramid is that only which will be dealt with here, for many sawn and hewn logs are frustums of such a pyramid.

The axis of a pyramid is the line from the vertex to the centre of the base; when this axis is perpendicular to the base it is a "right" pyramid, and when it is inclined the pyramid is "oblique." Pyramids have the following properties:—(1) All pyramids having equal bases (in area) and the same altitudes are equal to one another, no matter what the figure of the base may be. (2) Every pyramid is equal to one-third of the circumscribed prism, or a prism of the same base and altitude; therefore the solid content of a pyramid is found by taking one-third of the product of the base and perpendicular height. If a pyramid is cut by a plane parallel to the base, the content of the frustum (or part between the base and the section) is equal to the sum of three pyramids, each being of the same height as the frustum, and their bases being respectively the lower base of the frustum, the upper base, and a mean proportional between them.

A mean proportional between any two number is the number obtained by extracting the square root of their product; for instance, let it be required to find a mean proportional for the numbers 13 and 18: these multiplied give 234, the square root of which is 15.297 the number required, the proportion is stated thus, 13 : 15.297 :: 15.297 : 18. To find the solid content of the frustum of a pyramid, add into one sum the area of the two bases and the mean proportional between them. Then one third of this is a mean section of the base of a prism of equal height; therefore this mean area multiplied by the height gives the solid contents. To apply this rule let it be required to find the content of a regularly tapering log of timber 18 in. square at one end, 13 in. square at the other end, and 40 ft. long. The area of the greater base is 324 in. (18 by 18), that of the lesser base 169 in. (13 by 13), the mean proportional between these is 234 ($\sqrt{324 \times 169}$), the three added make 727 (324 + 169 + 234), which multiplied by 40, the length gives 29,080; one-third of this (9693.333) divided by 12 and 12, to bring inches to feet, is 67.315 ft., the content required. A second rule is: Multiply the area of the greater end by one of its sides, and that of the smaller end by one of its sides (it is assumed that the sides are equal); divide the difference of the products by the difference of the sides, and multiply by one-third the length of the log. For example, taking the same dimensions as before: Area of the greater end multiplied by its side 5,832 (324 × 18), area of lesser end multiplied by its side 2,197 (169 × 13), their difference 3,635 (5,832 - 2,197) divided by 5 is 727, and this multiplied by 40 (the length) and divided by 3 and 12 twice gives 67.315 ft., the content required. A third rule is to divide the difference of the cubes of a side of each end by the difference of these sides, and multiply the product by the height, one-third the result will be the solidity. Taking the same dimensions as before and applying this last rule, the cube of 18 is 5,832 (18 × 18 × 18), the cube of 13 is 2,197 (13 × 13 × 13); these cubes added make 3,635 (5,832 + 2,197). This sum multiplied by the height is 29,080, which, divided by 3 and 12 and 12, gives the content to be 67.315 ft. as before. The popular way of measuring this log is as follows:—A mean quarter-girth is taken at 20 ft. along the log; it would be 15 in. This squared and multiplied by the length is 66.736 ft., which is .579 too little,

or more than half a cube foot. Suppose, now, that this 40 ft. log is split down the centre, and that the content of the flitches are calculated by the quarter-girth method, what will they cube to? The mean section of each flitch will be 15 in. by 7 in., and the quarter-girth 11 in. (nearest by Hoppus); the content of each flitch will therefore be 36 ft. 8 in. 10 pt., and of the whole log 73 ft. 5 in. 8 pt., or 5 ft. too much! The quarter-girth system for measuring squared logs which do not taper considerably gives a result not very much out; but for measuring flitches rectangular on section it is wholly absurd. The only accurate way of ascertaining the contents of a log which is square on section and tapers regularly, is by applying one of the three rules given above; the first rule is applicable to unequal-sided timber, the second may be adapted to it, and the third should be applied only to logs with equal sides or square timber. The next geometrical solid which is frequently represented in converted building timber is the cylinder: it has two circular ends, and every plane section parallel to the ends is a circle equal to them also. When the side of a cylinder is perpendicular to the ends it is a "right" cylinder, otherwise it is "oblique"; the solid content of any cylinder is equal to the area of the base multiplied by its perpendicular altitude. A cylinder is to its inscribed square as 3 to 2, and to its inscribed curve as 3 to 1; that is, if a globe contains 2c. ft., the cylinder which exactly incloses it will contain 3c. ft., and the curve described in the cylinder, having the same base and height, will contain exactly 1c. ft. All sections of a cylinder parallel to the ends are circular, and all oblique sections are ellipses. In this connection it may be mentioned that a circle and ellipse are two distinct curves, and that an ellipse cannot by any possibility be constructed with circular curves, no matter how many may be employed, or how minute they may be. A circle is described from one centre with a fixed length of radius; whilst an ellipse is struck from two centres with radii which are constantly being altered in their relative lengths as the curve is generated. Applying the rule given above to find the contents of a cylindrical log 15 ft. long, and girting 42 in. First the area of the end must be found: the circumference squared will give this when multiplied by the constant .07958, $42 \times 42 \times .07958 = 140.379$; this area multiplied by the length 15 ft. gives 2105.685, which, divided by 12 and 12, show that 14.623 ft. is the content of the log. Working by Hoppus, the greater girth is 10 in., and the content for 15 ft. long by 11 ft. 5 in. and 9 pt., an amount too little by 3 ft. 2 in. and 5 pt. The error arises in assuming that the greater girth of the log is the side of a square the area of which is equal to the area of the end of the log. Here the side of such a square is 11.848 in. (circumference 42 in. by .2821 in.), and not 10 in. It is therefore impossible to ascertain by "Hoppus" the correct content of cylindrical log. The content by Hoppus will, however, always find favour in the trade, for it is considerably under the true content. The next regular solid, but one which does not occur very often in builders' work, is the cone, a round pyramid in fact, having a circle for its base, and its sides formed by right lines drawn from the circumference of the base to a point at the top, being the vertex of the cone. When the axis of a curve—that is, the line drawn from the vertex to the centre of the base—is perpendicular to the base, it is a "right" cone. When that axis is inclined to the base, it is an "oblique" cone. It has been explained that every line is equal to the third part of a cylinder of equal base and altitude; therefore the solid content of a cone may be found by multiplying the base by the perpendicular height and taking one-third of the product. For example, let it be required to find the content of a cone girting 42 in. round the base, and whose height is 12 ft. Here the area of the base is 140.379. This, multiplied by the height, gives 1684.548, one-third of which, 561.516 in., gives the content to be 4c. ft. nearly, 3.89 ft. exactly. Taking the mean girth at 21 in., quarter of which is 5 in., the solidity would be 2 ft. 3 in. and 6 pt. by Hoppus. The trunk of a tree tapers as it rises from the ground; the branches also taper, and both are nearly circular on plain sections taken at right angles to the line of upward growth. The nearest geometrical solid to the shape of a trunk of a tree, or its branches when trimmed, is a frustum of a right cone. The frustum (Latin "a fragment") of a cone is that part which is left

after cutting off the top by a plane parallel to the base, it is also any part lying between two planes which may be either parallel to or inclined to each other. The first kind of frustum will only be dealt with here, as it is a very close representation of the figure of round timber before it is converted. Few trees are exactly circular on transverse section, and fewer still have straight sides: it follows that as all rules for ascertaining the content of geometrical solids are determined for figures bounded by perfect circles or other regular curves and straight lines, when these rules are applied to tree trunks the calculated contents will be approximate only, and the accuracy of this approximation will vary as the cross section of the trunk varies from a circle, and the sides from straight lines. There is no possible way of ascertaining the exact content of a tree, nor is it required in practice that it should be done with mathematical accuracy; still, a content can be obtained which will be found accurate enough for all purposes, and this by the application of rules known and adopted by all skilled geometicians for the last 2,000 years or more. How to obtain the content of a cylinder has already been explained; but the rule for doing it will not help to find the contents of the trunk of a tree, for it tapers, and a cylinder does not, so that a rule which may be adapted for one will not apply to the other. The contents of a tree, that is, round tapering timber, must be calculated as if it was the frustum of a right cone, the nearest geometrical figure which it approaches in shape. There are several rules for obtaining the contents of the frustum of a cone, and all of these involve calculations which will be considered elaborate or otherwise as the operator is skilled in figures or unaccustomed to them; but a very slight knowledge of mathematics will enable anyone to apply the rule without much trouble. Rule 1. Add together the squares of the diameters of the greater and less ends, and the product of the two diameters; multiply their sum by .7854, and this product by the height. This last amount divided by 3 will give the contents required. This rule may be modified thus: Multiply the squares of the diameters added to their product by the height of the frustum, and then by .2618, and the result will be the solidity; here the process is shortened by dividing the constant in the rule .7854 by 3, and multiplying by the new constant .2618 found by that division. Rule 2. Add together the squares of the circumferences of the greater and less ends, and the product of the two circumferences. Multiply their sum by .07958, and this by the height; the last product divided by 3 will give the contents. This rule may be modified in this way: To the square of the circumference of the two ends add the product of their circumferences, multiply the sum by the height of the frustum, and the product by .02652 for the solidity. Here, as in the last case, the process is shortened by dividing the constant .07958 by 3, and obtaining a new constant .02652. This dispenses with multiplication by a high figure, and the subsequent division by 3. Rule 3. Find the mean proportional between the areas of the ends, add it to the areas of the ends; one-third of the sum will be the area of the base of a cylinder having the same height as the frustum, and this area multiplied by the height will give the content. The mean proportional between the area of the ends is found by extracting the square root of their product, as has been already explained, so that this rule may also be expressed in this way. Add to the areas of the two ends their mean proportional, and multiply the sum by the height of the frustum, and one-third the product will be the content. If S denote the solidity of the frustum required, D the diameter of the greater end, d that of the small end, C and c the circumferences, A and a the areas of the ends, and H the height, then the rules expressed by formulæ are—

$$\text{1st rule—} (D^2 + d^2 + D \times d) \times .7854 \times \frac{H}{3} = S$$

$$\text{Modified—} (D^2 + d^2 + D \times d) \times .2618 \times H = S$$

$$\text{2nd rule—} (C^2 + c^2 + C \times c) \times .07958 \times \frac{H}{3} = S$$

$$\text{Modified—} (C^2 + c^2 + C \times c) \times .02652 \times H = S$$

$$\text{3rd rule—} \frac{H}{3} (A + a + \sqrt{A \times a}) = S$$

Finding the content of a tapering tree is not, after all, such an easy matter as it looks, judging by the rules just given. Hoppus, in his "Practical Measuring," comes nowhere near it with his "mean" girt and "quarter" girt; in fact, this is so well known that we have now the

"true" content of a log and its "sale" content, according to Hoppus, which is not its content at all. Dr. Newton, in his "Cosmographia" (published for Thomas Passinger at the Three Bibles on London Bridge, 1679) says, after describing how to obtain the content of round tapering timber correctly: "Mr. Darling in his Carpenter's Rule made easie, doth propound a shorter way, but not so exact, which is by the circumference given in the middle of the piece to find the square—namely, by multiplying the Circumference given by .28209 or .2821, which side of the square being computed in Inches, and lookt in his Table of Timber Measure, doth give the content of the Tree not exceeding 31ft. in length." From this it appears that so early as 1679 tables for calculating the contents of tapering sawn timber were published, and that they were considered by mathematicians of the time as being merely close approximations to the true content. Mr. Darling did not, however, square his quarter girt, and multiply it by the length of the piece. He found the side of a square, which would in area be equal to the circle of which he took the mean girth, and multiplied this by the length, for the content of the tree. In Darling's method, the side of his equivalent square would, say for a girth of 50in., be 14.1in., whilst Hoppus would have made it only 12.1in., the area in the former case being 198.8in., and in the latter case only 156in.

In the next article, the opinions of various writers, "ancient" and modern, on the Hoppus method of measurements by quarter-girth will be given, and it will be shown that his way for obtaining the content of timber was never recognised as being correct by anyone who knew what he was writing about. In dealing with the dimensions of round timber, with a view to secure accuracy in calculating areas and contents, the following memoranda will be found useful: (1) The circle has not yet been squared, so that it is not possible to calculate the circumference and area of a circle from its diameter; the most accurate rules give, after all, only very close approximations to the real truth. (2) For the length of its boundary, a circle incloses a greater area than any other figure; a circle whose circumference is 3ft. 6in. will inclose a superficial foot, a square inclosing the same area will have sides 1ft. long each, or 4ft. in all. (3) The area of circles are to each other "as the squares of their diameters." This means that a circle twice the diameter of another circle will inclose four times its area; the end of a scaffold pole 6in. in diameter will have an area of 28.274in.; but a cylindrical log having a diameter of 12in. will have an area 113.097in., or four times as much. Again, a circular pipe 3in. in diameter will have an area of 7.0686in., or nine times as much as a pipe 1in. in diameter, the area of which is .7854. (4) A circle whose circumference is twice that of another circle will contain four times its area; three times the circumference will inclose nine times the area, and so on. (5) The circumference of a circle may be obtained nearly by multiplying the diameter by

3.1416; this is not the exact proportion, for the reason stated in No. 1. (6) The diameter of a circle may be obtained nearly by dividing the circumference by .31831. The area of a circle may be obtained nearly by multiplying the square of the diameter by .7854. (8) The diameter of a circle is obtained nearly by multiplying the square root of its area by 1.2837. (9) The girth of a circle—that is, its circumference, multiplied by .2821, will give the side of a square of equal area. For instance, a tree girths 64in.; what is the side of a square equal in area to a section taken at the place of girding? Here $64 \times .2821 = 18.0544$ in. (10) The diameter of a circle multiplied by .8862 will give the side of a square of equal area; a circle 30in. in diameter will be equal in area to a square whose side is 26.586in. ($30 \times .8862$). (11) A circle the area of which is one superficial foot has a diameter of 13.540534in. and a circumference of 42.538911614in. Its greatest girth is therefore 10.63473540in. The diameter squared is 183.346065, called by experts in timber measuring a "true" divisor; and the quarter-girth squared is 113.09759802801316, another true divisor, both looking very formidable, but not actually so, for in practice the decimals are all "shed."

STABLING AND FIVES COURT, WARLBECK, ILKLEY.

THIS building has lately been erected at Ilkley, under the superintendence of the architect, Mr. E. Brantwood Muff. The locally treated walling is of sandstone, from a quarry in the neighbourhood, a cavity being formed between it and an interior lining of bricks; in the stable salt-glazed ones have been used. The roof and the stable entrance archway are covered with tiles. A hayloft is formed over the bicycle and tool houses, the height necessary for the Eton Fives Court being obtained behind it. The contractor for the work was Mr. George Smith, of Ilkley. The vane, representing Pegasus, the door furniture, &c., were specially designed, and the drawing we illustrate was exhibited in the Royal Academy this year.

THE VENTILATION OF DWELLING-HOUSES.

By JOHN W. HAYWARD, M.D., late Vice-President of the Liverpool Architectural Society.

IT is not necessary to enlarge on the need of an abundant and continuous supply of fresh air in our houses, or on the necessity of a continuous removal of the vitiated air for comfort as well as health, because these are now fully admitted. It is only necessary to point out how these desiderata may be met without difficulty and at little cost.

A house has to serve two principal purposes—to live in during the day and to sleep in during the night. To be satisfactory, house ventilation must be adapted not to one only of these times, but to both. The means adopted for the purpose must also be adjustable to the different seasons of

the year—to the winter and summer, and spring and autumn; that is, the openings must be so under control as to be able to be enlarged or diminished according to the direction and velocity of the wind and the number of occupants of the house or room. In temperate and cold-temperate climates, the temperature of the incoming air must be so under control that it may be increased or diminished at will; that is, that it may be raised in cold weather, and lowered in hot weather.

Of the vast number of plans that have hitherto been suggested and tried, not one has proved entirely satisfactory. The reasons for this have, I think, been that they have been complicated, costly, and perhaps unsightly, and not adaptable to the varying circumstances. Architects and builders, and the public in general, have in consequence become afraid to listen to proposals for special house-ventilation, and have resigned themselves to submit to the primitive means of open windows.

Ideal house-ventilation is: (1) That none of the air within the house may be allowed to be respired or used more than once—never a second time or over again; that, having been once used, it shall be abstracted, and thrown back into the outer air, and be replaced with fresh direct from outside. (2) That fresh air shall be supplied in sufficient quantity to fully replace the air abstracted. (3) That this abstraction and supply shall be effected in such a manner that the occupants of the room will not feel the current or movement; that is, so as not to be felt as a draught. (4) That the temperature of the incoming air shall be so under control that it may be raised in cold weather and lowered in hot weather to any degree desired. (5) That the inlets and outlets shall be easily adjustable, by slides or valves. (6) That the provisions shall be such that the air may be allowed to pass through the house or rooms in quite a rush, or may be altogether arrested at will. And (7) That the whole house shall be included in the scheme, the lobbies as well as the rooms.

Such is ideal house-ventilation. Unfortunately, its provision is not free from complication, and it involves some expense—more of both, in fact, than most people care to incur. It is therefore seldom attempted, no other provision being made than for opening the windows; and it is erroneously supposed that on opening the windows at the top and bottom the air will come in at the bottom and go out at the top; but it will, under ordinary circumstances, come in at both, the two forming only one divided inlet. The inside air being less cold, and therefore less heavy, is pushed out of the room up the chimney, and into the lobby by the colder, and therefore heavier, air coming in through the window openings; and, unfortunately, that coming in through the upper openings tends to fall on to the heads of the occupants, and that coming in through the lower to pass to their feet. The consequence is that during use of rooms the windows are usually closed, and there is no ventilation at all, so that the rooms become hot and stuffy.

I admit that ideal ventilation is not practicable for ordinary houses; but I do not believe that a practicable scheme for ordinary houses is an impossibility. In formulating this, however, regard must be had to popular prejudice rather than to scientific perfection. The window openings, the doorways, and the chimneys must be used as the principal channels for the ingress and egress of the air. The two principal seasons of the year must be provided for—namely, winter and summer; and the two principal times of use of the living rooms—namely, when occupied and when not occupied; and of the bedrooms when the occupants are on the bed and when on the floor. In cold weather ingress by the doorway is to be preferred. In the living-rooms the inlet should be at, and only at, the top by 2in. or 3in. of the top of the door being fixed with hinges, to open inwards and be easily opened and shut. The opening of the door for entrances and exits will also let in much air from the lobby. Into the bedrooms the inlet should be at, and only at, the bottom, by 3in. or 4in. of the door being fixed with hinges, to open inwards and upwards, and be easy to open and shut. For egress the chimneys and crevices will have to be trusted to. In hot weather ingress by open windows is perhaps the best, or at any rate it may be utilised, again trusting to the chimneys and crevices for egress, when the room is occupied. The same provision must be made with the windows as with the doors. For the living-rooms a 2in. or 3in. opening, perhaps of coloured glass, across the whole or part of the top of the window should be fixed on hinges and be easy to open and shut. Perhaps of the window nearest the door it should be made to open inwards, and of that farthest away from the door to open outwards, in order if possible to determine the ingress and egress. For the bedrooms only the bottom of the window should be made usable for special inlet. The lobbies may be ventilated in the same way; but here the inlets should be larger, and if possible means should be provided for warming the air.

The localities indicated for the inlets and outlets are not only dictated by theoretical considerations, but are enforced by personal practical experience. The object in view in having in the living-rooms the inlet at the top of the window and door is that the incoming air may be directed, not straight on to the occupants, but upwards to above them, and be tempered by the warmth always present in the upper part when the room is occupied. In the case of the bedrooms it is altogether different; here the heavy cold air coming in at the top falls upon the occupants of the bed as a dangerous draught, whereas coming in at the bottom it falls to the floor and passes along it to rise up around the bed and replace the light warm air ascending from the occupant of the bed: during undressing and dressing the inlet may be closed, if necessary.

"THE ENGINEER IN SOUTH AFRICA."*

THE volume under the above title is a review of the industrial situation in South Africa after the war, and a forecast of the possibilities of the country. Mr. Stafford Ransome, M. Inst. C.E., special commissioner of the *Engineer* in South Africa, the author, was appointed by that journal at the close of the war to visit all the British possessions south of the Zambesi River, and to write frankly on the various problems which have been evolved by recent events. He was to be unhampered by any editorial point of view. The series of articles on "South Africa from an Engineer's Point of View" which appeared in the pages of our contemporary was the result. The author of the present volume has, by permission of the editor, availed himself of the material and suggestions of these articles, and though a large proportion of the matter has appeared in the columns of the *Engineer*, the present book is by no means a reprint, but rather a rearrangement of the substance of those articles. The author is right in thinking that the future success of British South Africa will largely depend on the engineering and industrial possibilities of the country, and that the book he has written should appeal to a larger class than that of the engineer. The earlier chapters are of a controversial character, and deal with the industrial geography, cost of living and travelling, politics and their bearing on the industrial question, the business "boom,"

labour question, intercolonial relations, &c. The latter portion of the book treats of the more important engineering industries as now carried on, and their possibilities. As Mr. Ransome observes, the late war has had the effect of effacing the commercial and industrial map of the country, as we know it; familiar landmarks have been partially obliterated, others have sprung up, and the present political boundaries will be of decreasing importance. "The South Africa of the future will be ruled not by the seaports, or even necessarily by the coastal colonies, as in the past, but by the great industrial centres. Up to the present the position of Johannesburg, Kimberley, and Rhodesia may be likened to that of the prisoners of the Fleet, whose gaolers could fix the price at which they delivered to them their food from the outside world. The coastal colonies have been those gaolers, and owing to the complications of Anglo-Dutch misrule, have been able to sweat and hamper the industries of the interior. . . . The growing strength of the industrial centres is slowly but surely undermining the political importance of Cape Colony." The author says the political tendency of Southern Cape Colony, the centre of all that is retrogressive and anti-British in South Africa, is towards parochialism and isolation. The alleged "boom" that was to take place as the result of peace is impossible, for a long time must elapse for the country to recover from the effects of a long war. The author confirms Lord Milner's forecast that it is Johannesburg that will some day develop into a city of several millions, and which will be the industrial capital of South Africa, and it is to that place that British industrialists should direct their attention. From an engineer's point of view, the centre of interest lies in the Transvaal, of which this city is the chief. Cape Town will, it is said, decrease in importance except as a port and depot. There are five routes to Johannesburg from the sea—(1) to Cape Town, over 1,000 miles; (2) to Port Elizabeth, southwards and westwards, 714 miles; (3) to East London, 660 miles; (4) to Durban, 483 miles; and (5) north to Pretoria, and then eastwards to Delagoa Bay, 396 miles. Of these five termini on the coast, Delagoa Bay is said to be the best natural harbour; the route from Cape Town is chiefly used for mails. Referring to the cost of living and travelling, many interesting figures are given worthy the attention of all those who contemplate going to South Africa. The author places the average hotel expenses of an ordinary commercial engineer at about £2 a day in the towns. In addition, club life must be reckoned as an average 10s. per day. Cab fares are about 10s. an hour in Johannesburg. A visitor in the large centres may put his daily cost at £2 15s. per day. As to the engineer, his hotel and club life will cost him not less than £2 per day; lodgings in Cape Town, Kimberley, and other large towns will range from £8 to £15 per month for bare board and lodging. In Johannesburg the cost of living would be about £30 to £40 per month at the least. The author gives a useful scale of the rates of the pound sterling in the more important districts, as follows:—

Natal and Coastal Cape Colony	12s. to 13 0
Central Cape Colony & Orange River Colony 10 0	
Transvaal and North Cape Colony	8 6
Southern Rhodesia	6 0

These figures show the value of a pound sterling as we know it in London for a man with a small salary—say £300 to £400 a year. The chapter on "The Prospects of Employment" is instructive. Wages vary much in different parts. In Natal they are higher than in Cape Colony near the coasts, in Kimberley and Northern Cape Colony they are still higher, in South Rhodesia highest of all. The author says the only male white labour wanted in South Africa just now is for the building, agricultural, and pastoral industries. Building trade hands on Coastal Cape Colony, provided they are skilled and steady, can easily find employment at from 10s. to 12s. 6d. a day, exclusive of overtime. The average normal week is from 48 to 51 hours. "The amount of building and construction work which is going on now, and which is daily increasing, makes it a practical certainty that any artisan in this line may reckon on securing work with but little delay after arrival which will bring him in at least £3 per week." The wages of skilled mechanics are about the same, though the artisan engineer is not wanted just now in great numbers. A fitter,

pattern-maker, or smith in England, who is skilled and steady, can obtain at least 32s. to 36s. a week; "but in Cape Town he will find living nearly twice as costly as in London, and less comfortable. . . . His bare board and lodging will cost him from 25s. to 30s. a week, and it will be bad at that just now." For the engineering artisan who has to find lodgings and live as best he can until he has made a settled home £3 a week will not go so far as 35s. in London, or as 25s. in some of the less expensive engineering centres in Great Britain. For married men the prospect is less encouraging if he transmits half his earnings to his family at home. The author says large numbers of professional engineers have come out to South Africa since the war, and he is hopeful as to the prospects for engineers, though there is a good supply of practical mining and railway engineers on the spot. The chapter on "The Labour Question" is instructive, and many of the problems are discussed. Mr. Ransome shows up the pernicious "catch phrase" of British writers who say that South Africa is "a white man's country." He shows that it is impossible to plant British unskilled labour all over the country, for if we should force such a measure upon the country every loyal British employer of labour would be transformed into a Dutchman. Mining is, of course, the staple industry, and without it South Africa would be valueless. In the chapter on "Struggle for Life in Rhodesia" the author gives the following idea of the price of labour in monthly salaries and wages, which are very tempting, but must be discounted by the high cost of living we have noticed. Thus bookkeepers obtain £30 per month, blacksmiths £35, clerks £22 10s., domestic servants from £5 to £15, gangers £15, gardeners £15, mine managers £75, printers £30, prospectors £30, shop assistants £20, stonecutters £32 10s. Daily wages: Bricklayers 30s., brickmakers 15s., carpenters 25s., engine-drivers 25s., fitters 30s., masons 32s. 6d., miners 25s., painters 25s., plumbers 25s., &c. The white artisan stands a good chance of employment now; but the cost of living and waiting requires that he should have about £40 to £50 after landing in Cape Town. We cannot refer to the other chapters on the possibilities in the Orange River Colony, a business policy for manufacturers, the theory and practice of railways, harbours, Durban harbour, diamond-mining in Kimberley, treatment of gold ore, well-boring, irrigation, and other descriptive chapters on engineering industries as carried on, and their prospects. Many useful suggestions are made. In dealing with the policy of manufacturers, the author thinks that it is far the best method for a number of firms whose interests do not clash to amalgamate for purposes in South Africa. The book is interesting and instructive, and ought to be read by every engineer, artisan, and manufacturer who is contemplating going out to South Africa. The work is illustrated.

"THE ARCHITECTURE OF BUSINESS BUILDINGS."

MR. J. W. BEAUMONT, President of the Manchester Society of Architects, gave his address on Thursday evening in last week at a special meeting in the Boardroom of the Chamber of Commerce, Mosley-street, Manchester. He looked forward, he said, to the time when architectural societies may become so important in large towns that they may be consulted by the public authorities in cases of proposed improvements or new streets to be formed in those towns.

DESIGN IN STREET ARCHITECTURE.

It will never, he admitted, be possible for a public body to say that the buildings in an important street shall all be carved out of a certain design, nor that a certain architect shall be appointed to carry out all the buildings in such a street; nor would this be desirable. Variety of street architecture is, to his mind, much better than uniformity. Generally, each building had its own use, and should by its architecture express the purpose for which it was erected. It would be absurd to confine the elevation of a street to one architectural design, where one building may be used as shop premises, another as a set of offices or chambers, and another as a warehouse. But it would be held that some control should be exercised to see that proper and suitable heights are maintained and that materials are used in the various buildings that will harmonise with neigh-

* The *Engineer* in South Africa. By STAFFORD RANSOME, M. Inst. C.E. Westminster: Archibald Constable and Co., Ltd., Whitehall-gardens.

bouring edifices. One thing he wished to impress on his hearers was that more control should be exercised by public bodies in seeing that all new buildings are erected in such a manner as to minimise the risk of fire.

THE REGISTRATION QUESTION.

Several subjects of great importance had received a large amount of attention during the last twelve months, and the greatest of these was the question of the statutory registration of qualified architects. The time is at hand, Mr. Beaumont thinks, when architects must make up their minds on this question. In order to ascertain the general feeling on the subject he had invited the opinion of various societies in different parts of the country, and out of twelve from which he had received replies, six were in favour of registration, one against, two were divided in opinion, and three had not discussed the question. The Manchester Society had already pronounced in favour of registration. Of course, as was the case in other professions, no form of registration would suffice to suppress "quacks," but it would enable the public to discriminate between qualified and unqualified architects. It would also be an advantage to a man to employ an architect who was legally qualified, and against whom he would have legal redress in case of neglect or incompetence.

OUR SCHOOL OF ARCHITECTURE.

As to education, Mr. Beaumont said it was important that architectural students should pass all the examinations of the Royal Institute of British Architects, and not simply the first and second. In this connection, he referred to the establishment of a School of Architecture in Manchester. He was glad that this school had been established. The time of apprenticeship might perhaps be shortened for those who had passed through the school, but nothing in the shape of theoretical or academic training would enable a student to dispense with the practical training of an architect's office. He believed that this Manchester School of Architecture will become, under the care of Mr. S. H. Capper, one of the foremost centres in the kingdom for the instruction of architectural students. Turning to the question of competitions, Mr. Beaumont suggested that the principle had been overdone. He recognised the value and need of competitions in the case of public buildings, but in all cases they should be conducted on an equitable basis. He indicated certain ways in which a useful reform in regard to competitions might be brought about.

Mr. Alfred Darbyshire (who has filled the office of president for the past two years) moved a vote of thanks to the President for his address.

Mr. S. Henbest Capper (of the School of Architecture), in seconding the motion, gave the result of his experience of the working of a registration law in the province of Quebec. Whilst he was at the head of the School of Architecture in that province, Architecture was made a close profession in the same sense as the Bar and Medicine are close professions. Some of the results were not exactly what one would wish. One of the immediate results was to flood the profession with unqualified men, because every person who had had a sign-plate with the word "architect" upon it had to be admitted as a qualified architect. Of course time would cure such an evil. With regard to the School of Architecture, here in Manchester he fully appreciated the necessity of practical training. He suggested, however, that arrangements might be made whereby students, in some cases, might carry on their collegiate training side by side with their practical work.

THE MODERN SKETCH CLUB.

THE second exhibition of the Modern Sketch Club, opened to the public at The Modern Art Gallery, 175, Bond-street, last Saturday, contains many interesting sketches by members of the Langham, the London, the Dublin, the Scottish, and other sketching clubs. We can only notice in a brief glance at the exhibition, Albert Ludovici's bright figure subjects and London sketches—a coquettish young lady with fair hair in evening dress, near whom sits a young man, entitled "What Shall We Do?" his "Apsley House," a sketch of Hyde Park Corner on a dark evening (31), and "Rotten Row" (45), &c. Percy French sends a sketch in Hyde Park, showing the fine pink blossom of the rhododendrons, and "A View in Connemara" (60). Hugh Rudy (15) has a landscape "A Grey

Day," bold and crisp in the foliage. H. Moxon Cook, "Cottages, Achill Island," is vigorous. Miss Sophie D'Ouseley sends one or two architectural sketches of interest, "Lord Leicester's Hospital, Warwick" (18), and "Christ Church Cathedral, Oxford" (24). Miss E. Jex-Blake is, as usual, happy in her firm, crisp sketches of morning and evening effects on the River (19, 32). Hal Hurst sends three subjects, "Paris Plage" (17), "Molly" (73), "The Old, Old Story" (103), full of character and power, and Stanley S. Young gives us a clever sketch of a young girl in chair, in a pensive mood (43). There is a sketch, also, by the late Phil May, "At Eventide," that will possess interest. Richard B. Hunter has a skilfully composed subject, "The Spell," a weird witch scene in a forest, and R. Stone's figure subject, "The Quarrel," a lady in white with black hat, leaving a room, is decidedly good in attitude and drawing. Geo. C. Haité's subjects have always a charm, his market scene, "Tangiers" (62), is a wonderful study of strong sunlight, and a crowd of figures full of vigour and rich colour. His "Old Timber," is a delightful study of woodland in mellow tones of brown and green. Cecil W. Quinell sends two delightful studies of girls. "Sybil" (55) is a fair, auburn-haired girl, with sweetly expressive eyes; and "Marie" (123) a study of a girl's head, in large, white tulle hat, very graceful. James Aylward, in "The Lost Letter" (68), draws a girl reading a letter by a cottage fire. There are works also by Edward Slocombe (109), T. W. Holgate (118), Alfred E. Lewis (99), Geo. C. Haité (124), John Whipple (143), Miss Millicent S. Gore, Val Davis (180), Sylvester Stannard, Bingham McGuinness (184), A. Simpson (152), Champion Jones (165), which show decided skill in drawing and firmness of handling.

THE RESPONSIBILITIES OF THE MUNICIPAL ENGINEER.

THE opening meeting of the Yorkshire College Engineering Society was held on Monday night at the College, Leeds, when Mr. E. J. Silcock, M.I.C.E., delivered the President's address. Mr. Silcock said he had been present at the birth of the society, and now was called upon to preside over its meetings. He believed he was the only old student of the college who had ever occupied the position of President. He proposed to speak to them on the subject of municipal engineering. The importance of this department of the civil engineer's profession was too often overlooked, and it was only of late years that the corporations of the country had realised that, in order to secure the services of first-class engineers to direct their engineering works, they must appoint men who had been specially trained, and must pay them adequate salaries. The municipal engineer had, probably, a greater influence on the health and well-being of the inhabitants of the town which he served than any other individual in that town. In addition to the control of the conditions of health in a city or town, the engineer had to direct the policy of the Corporations in dealing with vast sums of money. Only men who possessed a thorough knowledge of engineering principles, coupled with sound judgment and the capacity to take a broad view of the development of a city, could be trusted to deal with interests of the magnitude which every day confronted the municipal engineer. During a recent session of the society, said Mr. Silcock, he had read a paper descriptive of the new waterworks in connection with the extension of the water supply of Leeds. These works involved the construction of four immense reservoirs, formed by damming up the valleys of the Burn and Laver, together with the conduits necessary for conveying the water to Leeds. These works extended over a length of 46 miles, and the expenditure would amount to over two millions sterling. Another example of municipal engineering in Leeds was the electric tramway system. Both these gigantic undertakings were designed and executed by the municipal engineer. In the larger cities the work of Corporations had become so great that it was more than one man could accomplish, and the work had to be subdivided into departments. But in every case the Corporation looked to the engineer-in-chief to guide them in all new departures of big undertakings. Mr. Silcock went on to speak of bridges, and remarked, as to the necessity for sound building, that it was not an uncommon thing in Leeds to have loads of 75 tons pass along the roads upon four wheels.

Sewerage systems, purification systems, the application of sewage to land, water supply, the acquisition of gathering grounds, street improvements, the prevention of floods, tramways, light railways, electric lighting, gas works, destructors, and architectural work were all referred to and enlarged upon as forming part of the duties devolving upon the municipal engineer. In conclusion, Mr. Silcock urged that in spite of drawbacks in connection with having to deal with changing public bodies, municipal engineering offered good openings to those well up in their profession.

REGISTRATION OF TITLE.*

By J. S. RUBINSTEIN, London.

UNDER the Bankruptcy Act of 1883 the administration of estates in bankruptcy was brought under the jurisdiction of the Board of Trade. The burden of officialdom thus imposed on bankrupt estates is notorious. In the case of the insolvency of a person, creditors will, as a rule, accept almost any terms rather than have the estate wound up in bankruptcy—indeed, the most potent argument used to induce creditors to accept a composition is to assure them that if the offer made is refused the estate will have to go into bankruptcy. I will not, however, now pursue the inquiry into the operation of officialdom in bankruptcy, as our time can be more usefully employed in considering a threatened extension of its operation in another direction, where it would take effect in innumerable daily transactions in every county in the kingdom, involving an outlay of many millions. I refer to the extension of officialdom that has already resulted, and is still further intended to result, from the passing of the Land Transfer Act, 1897. The history of registration of title in this country stated shortly will, perhaps, best explain the grave position in which we stand. Registration of title was first established in this country in the year 1862. This Act was followed by an Amending Act in 1875. Under one of these Acts it was, and it is to-day, open to every property owner in the kingdom to register his title. The Acts proved, in fact, dismal failures. Owners discovered by experience that the absolute titles they obtained created new and unlooked-for difficulties in dealing with property. Every conveyancing expert came to recognise that the system was wholly unworkable, notably Lord Cairns, the author of the 1875 Act, and who subsequently set himself to work to reform the old system, and succeeded far beyond expectations in effecting this object by his Acts of 1881. The system of registration being discredited and abandoned by every expert, it would appear incredible that a people who pride themselves on being above everything practical should have consented to the passing of the Act of 1897, whereby the system of registration of title has been brought back to life, and actually made compulsory. Shortly, the explanation of this phenomenon can, I believe, be summarised as follows:—(1) The Act of 1862 brought certain officials into existence, and officials, once created, attach themselves so tenaciously to the public purse, that the task of dislodging them becomes superhuman. (2) Legal matters being outside the ken of the average layman, it is customary to accept on trust any measure affecting legal changes which the Lord Chancellor for the time being brings forward. His authority on law questions is supreme, and for obvious reasons cannot well be questioned by the legal profession. Solicitors in this connection, I should add, do not count, as their influence with the authorities is practically nil. (3) The present Lord Chancellor was appointed to that office in 1886, an office which he has since held, except between the years 1892 and 1895, when a Liberal Government was in power. Unfortunately, he never had any conveyancing experience, and a knowledge of conveyancing does not come by intuition, even to Lord Chancellors. On the other hand, he must be credited with a profound and unbounded faith in officialdom. Commencing with the year 1887, he brought in almost yearly Bills to make registration of title compulsory all over the kingdom. By dint of perseverance, and by means of extreme pressure most skilfully applied, he ultimately succeeded, in 1897, in inducing the opponents to fall in with a so-called compromise, whereby the opposition to his Bill was withdrawn

* From a paper entitled, "The Blight of Officialdom," read Oct. 14 before the Law Society at Liverpool.

on the representation that the system of compulsory registration of title would only be tried in one county as an experiment for three years. Having obtained the Act, the authorities apparently recognised that the system of officialdom could be most easily fastened on to London. The necessary consent of the London County Council having been obtained, the Act first came into operation in certain parishes in London on Jan. 1, 1899, and it was subsequently extended gradually to the whole of the county, the City of London coming last under the Act on July 1, 1902. In the sessions of 1900, when one year only of the experimental period had run off, the Government brought in a Bill to expend £265,000 of public money in purchasing extensive property in Lincoln's Inn, in order to erect a permanent Registry office. In these days, when millions are voted away in a few hours, Parliament cannot be expected to trouble about such a trifle as £265,000, so the Bill passed without a word of objection. The authorities were, however, good enough to intimate that in erecting the office there was not the slightest intention of departing from the understanding arrived at when the 1897 Act was passed. The experimental period of three years came to an end in December, 1902, and most strenuous efforts have since been made to induce the authorities to hold the inquiry into the working of the system that Parliament was led to believe would follow the trial of the system. The authorities, however, now scout the idea of an inquiry. Plain people may well ask what possible object can there be on the part of the Government in evading an inquiry if the new system were really intended to benefit the public. The system is either good or bad. If it is good, an inquiry might be trusted to bring out this fact, with the result that the system could then be confidently extended all over the country. If, on the other hand, it is bad, the sooner the system is ended the better it will be for the public. Why, then, does the Government shrink with such manifest terror from an inquiry which would bring this question to the test? Surely a system which is so weak that its sponsors will not allow it to be investigated for fear it may fall to pieces stands self-condemned. The facts in connection with the inception and working of the Registration Acts cannot be too urgently or too often brought under notice. At former meetings—at Birmingham in 1897, at Weymouth in 1890, at Oxford in 1901, and also at the Building Societies Congress held at Cheltenham in 1902—I have read papers wherein I have explained that the conditions in this country, particularly in view of the freedom allowed to property owners to tie up or deal with their property in any way they please—conditions wholly different to those existing in our Colonies, for instance—make it practically impossible to introduce a registration system sufficiently elastic to be a workable one. I have also dealt in detail with the working of the new system of compulsory registration of title, and have shown how it added grievously to expense, greatly increased delay, opened a wide door for fraud, and tended generally to throw conveyancing into a state of utter chaos. I will therefore content myself now with giving only the barest outline of the system. The new system is at present in operation in only one county in England—the County of London—and it cannot be denied that it has added most seriously to the difficulty, delay, risk, and expense of property dealings in London. In small transactions—£90 to £1,000—the increase in the expenses ranges from 24 to 41 per cent. Some idea of the extent to which business is hampered may be gathered from the fact that the Methodists found the system so onerous that they took steps recently to promote a Private Act to exempt their property from the Act of 1897, and they only refrained on the Lord Chancellor finding it expedient to relax in their favour the provisions of which they complained. Three sorts of title can be registered:—(1) Possessory, (2) Qualified, (3) Absolute. The following table will, however, show that in practice only possessory titles—a character of title which has not a counterpart in any country in the world—have hitherto been registered.

From the first I have argued that the registration of possessory titles was a delusion and a sham. As we do not live in an age of miracles, it was impossible for me to conceive how a system that broke down utterly when tried as a permissive one under the Acts of 1862 and 1875 could become a successful one simply by being made com-

Year.	Freehold.			Leaschold.			Total.
	Absol-ute.	Quali-fied.	Pos-sessory	Absol-ute.	Quali-fied.	Pos-sessory	
1869	15	—	894	1	—	2,131	2,954
1900	21	—	2,564	—	7	8,774	11,366

—	74	—	11,100	2	9	35,651	46,236

pulsory under the Act of 1897. To prove that my view was the right one, it will be sufficient for me to quote Mr. Brickdale, the registrar himself, who at the Building Societies Congress said:—"Then with regard to the possessory title not taking any account of prior encumbrances, a certain amount of capital has been made against the Act sometimes on that account. It is said, Why do you allow a man to pose as the owner of an unencumbered fee simple when really there is a huge mortgage in existence, or when really there is a lease, perhaps at a very high premium, which takes away half the value of his property from him? Well, if you are going in for the system of possessory registration at all, it is far better, it seems to me—I am only defending what others have done—it is a far better plan to have it quite understood that the possessory certificate not only is not to be relied upon for anything prior to the registration, but that it entirely ignores it, and that people must look outside for all encumbrances prior; and that is why no mention either of restrictive covenants, or of mortgages, or of leases (as a rule) prior to the registration is entered on the possessory certificate. These are all matters which are dealt with outside the register, and will be shown by the abstract of title which the owner will have to keep until such moment arrives as he thinks he may as well try for an absolute title and get it settled for good. In a matter of this sort you cannot register half in one form and half in another. If we take to mentioning any of these things people would begin to think they may rely upon us for all of them, and I think the rules are perfectly right in saying that we are not to mention encumbrances at all." In the above extract the words I have italicised make it clear that a possessory title will not grow into an absolute one, and that the latter will have to be obtained quite independently, and yet in what terms can we speak of the registry office that continues to this day to tell the world that the registration of possessory titles is of real value? Notwithstanding Mr. Brickdale's frank admission that the possessory titles which are now being registered cannot mature, and that they are, therefore, practically valueless, that system of registration goes on merrily, some 400 of such titles being registered weekly, a heavy toll being levied on all transactions to pay for the music. The officials have, however, felt the force of the hostile criticism which has been levied on all sides against the new practice, and they have been for some time past at their wits' ends to devise a scheme which would serve as a pretext for continuing their official existence. In this they are simply obeying the instincts of self-preservation. Holding practically any number of blank cheques on the Exchequer, they will not recognise that there is such a word as failure. They may consequently be depended upon to go on for all time trying one experiment after another, the interests of the public being wholly absent from their thoughts. A scheme has at last been evolved which the authorities no doubt fondly hope will prevent them hearing the hated word "inquiry" for many years. Under the Land Transfer Acts the Lord Chancellor is empowered to make rules with the advice and assistance of the Rule Committee. The Rule Committee under the Acts consists of the registrar (Mr. Brickdale), a Chancery Judge (Mr. Justice Kekewich), and the nominees of the General Council of the Bar (Sir Howard Elphinstone), the Board of Agriculture (Mr. J. W. Clark), and the council of the Law Society (Mr. W. Melmoth Walters). Mr. Brickdale advocated that a possessory title registered upon a sale under ordinary conditions completed by entry into possession should be turned into an absolute title after the lapse of two years. The other members of the committee are stated to have decided to alter the initial period from two to twelve years; but this decision was overruled by the Lord Chancellor, who, on his own initiative, has, in

the draft rules which have recently been issued, fixed the period at six years. According to the Act, the Lord Chancellor is to make the rules "with the advice and assistance" of the committee. The Lord Chancellor's reading of the Act is "with or against the advice" of the committee. What it is to be a Lord Chancellor! If it is realised that every conveyance brought at the present time into the registry is without publicity registered as a matter of course, and without any inquiry as to the title of the person who purported to grant the conveyance, and without noticing on the title the existence of a mortgage lease or other encumbrance, you can obtain perhaps some slight conception of the danger that will follow if a title so registered is in six years to be turned into an "absolute" one, carrying with it a State guarantee. The new proposal will not bear the slightest scrutiny. The fact being admitted that for practical purposes a possessory title is valueless, it is clear that the earlier title must be investigated before an absolute title can be issued. A postponement of six years from the date of registration of a possessory title does not obviously lessen in any way the necessity for, or simplify the investigation of, the earlier title.

The officials are on the horns of a dilemma. If they investigate the titles properly, their work will be so great that they will be unable to cope with it, even if twenty additional registry offices, each employing their 200 officials, are provided. The expense also will be enormous; and must be provided from some source; but this is a matter which does not trouble the authorities. If the officials dispense with investigation, or investigate to a limited extent only, everyone possessing the slightest practical knowledge of the subject will recognise the extreme danger of bad titles being registered as absolute ones, and can only wildly guess at the extent to which this procedure will involve individuals in ruinous litigation and the State in incalculable liabilities. It is amazing and humiliating to think that without any further sanction from Parliament a rule can be formulated at the instance of one individual, without having himself any practical knowledge of the subject, and against the advice of all his independent expert advisers, which may have the effect of involving the country hereafter in liabilities that may extend into millions. Verily it is true that officialdom cares not what number of houses it burns down so long as it provides a sufficient quantity of roast pig for itself! The question that naturally arises is whether some relief cannot be obtained from Parliament. I, however, fear it is far too obvious that to rely upon Parliament is to rely upon a broken reed. The difficulty of getting any measure through Parliament is immense; but once a measure is passed, the difficulty of getting Parliament to reconsider the matter is practically insurmountable. The circumstances under which the Act was passed in 1897 would lead one to imagine that Parliament, jealous as it should be that every minister should loyally carry out every understanding come to, would have insisted upon the inquiry after the experimental period of three years had elapsed; but Parliament has rarely a moment to spare for a subject, like the one under consideration, that is not a party question. As a matter of fact, a discussion was raised in Parliament in May last on the Land Registry Vote. It is worth while giving a short consideration to the discussion, as it throws a strong sidelight upon the methods by which we are governed, and shows what great tacticians our rulers are, and doubtless later on we will be told that the division that took place expressed the deliberate view of Parliament that no inquiry into the system was required.

Under the auspices of the Newcastle-upon-Tyne and District Clerk of Works and Builders' Foremen Association, on the 7th inst., Mr. D. S. Jones, of the firm of Messrs. Jones and Maxwell, Pelaw, lectured at the Collingwood Restaurant, Newcastle, on "Bricks and their Manufacture."

The work of reconstructing the town-hall at Birkenhead, which was recently severely damaged by fire, is actively progressing, and on Thursday in last week the cupola on the tower was successfully hoisted into position.

The Federal House of Representatives, by an exhaustive ballot, have selected Tumut, near the Murray river, New South Wales, as the Federal capital for Australia. The New South Wales members were in favour of Lyndhurst, which is only 100 miles from Sydney. The House decided that the Federal territory attached to the new capital should consist of 1,000 square miles.

OBITUARY.

MR. HENRY MARC BRUNEL, M.I.C.E., who died on the 7th inst., aged 61 years, was the second son of I. K. Brunel, the engineer. Although only 17 when his father died, he took a personal part in some of the later engineering works, notably in the launch of the *Great Eastern*. He was educated at Harrow and at King's College, London, and served a premium apprenticeship. Before his active entry into professional life he was engaged for some years with his brother, the late Dr. Isambard Brunel, in compiling the life of their father. He entered in the seventies into partnership with Mr. (now Sir John) Wolfe Barry, and was largely associated in the important work of Barry Dock, the railway bridge over the Thames at Blackfriars, and the bridge recently erected at Connel Ferry, as also with the Tower Bridge. In the autumn of 1901 he had a slight apoplectic stroke, followed a few months later by the bursting of a blood-vessel in the brain, from the effect of which he never fully recovered.

CHIPS.

Memorial-stones in connection with the Salvation Army's new citadel in Main-street, in the Anderston district of Glasgow, were laid on Saturday. The cost of the building is estimated at £4,600.

The First Presbyterian Church at Armagh was reopened last week after renovation and decoration, carried out at a cost of £600 by Mr. James Maxwell, of Armagh.

The new wing and hospital which have been added to the fine buildings housing the Manchester and Warehousemen and Clerks' Orphan Schools, at Cheadle Hulme, were declared open on Saturday. By the generosity of the trustees of the late Mr. Manasseh Gledhill a sum of £7,500 was recently contributed to the institution for the additions. The new wing, so provided, affords additional space for 70 beds in the girls' dormitory, and a considerable enlargement of their recreation-room, while the new hospital contains 30 beds in the infectious and 20 beds in the non-infectious departments. The architects were Messrs. W. and G. Higginbottom, Manchester, the contract being carried out by Messrs. Burgess and Galt, builders, Ardwick, at a cost of £7,500.

The electrical committee of the Manchester Corporation have received and accepted a tender of resignation from Mr. G. F. Metzger, their electrical engineer, arising out of a misunderstanding as to the terms of agreement.

The opening meeting for the present (the eighth) session of the Glasgow Architectural Craftsmen's Society was held on Friday evening at 204, George-street, Glasgow, when an inaugural address was delivered by Mr. Ernest Monro, A.R.I.B.A., who selected as his topic the demands of construction.

On Wednesday week the new public library and reading-rooms, erected at a cost of £5,000 on the New-road (East-end), Chatham, were opened. Mr. Carnegie has given £4,500 towards the cost of the new buildings. Mr. Bond was the architect, and Messrs. West Bros. were the builders. These were also the architect and builders of the town-hall of the borough.

The third and last of the new schools erected under the Hugh Henry Boyd endowment scheme was opened on the 1st inst. in Roden-street, Belfast. The main schoolroom is 40ft. by 24ft., with the ceiling open to the ridge. The room is lighted by large windows on either side. A classroom 17ft. by 16ft. is entered from a passage, and is fitted up with a gallery. The building is erected in perforated brick, and the upper portion is rough-dashed. The work has been carried out by Messrs. MacIvor Bros., from plans and under the superintendence of the architects, Messrs. Young and Mackenzie, also of Belfast.

The Princess Louise (Duchess of Argyll) has consented to visit Croydon, for the purpose of unveiling the statue of the late Queen Victoria, which will occupy a prominent position in the centre of the town. The date of the ceremony is towards the end of the month.

The Governors of King's College Hospital held a special meeting on Monday, at which, after considerable discussion, a resolution was adopted in favour of removing the institution to South London. An Act of Parliament will have to be obtained authorising the removal, and the committee were authorised to apply for the necessary powers, and to take steps to secure a new site. Professor McHardy suggested that in the new hospital they ought to have accommodation for 600 beds without cramping. He mentioned that he had in his possession offers of three different sites in South London varying in extent from 11 to 20 acres, which could be procured at from £3,000 to £4,000 per acre.

Building Intelligence.

CHRISTCHURCH, HANTS.—On Wednesday week the Earl of Northbrook, G.C.S.I. (Lord Lieutenant of Hampshire and chairman of the Education Committee of the County Council) opened a new technical school at Christchurch, which has been erected as a Queen Victoria memorial. The building is in the form of an extension of the town hall, and consists on the ground floor of two large rooms for technical instruction, and a smaller room for cookery classes. There is also an office for the surveyor and other rooms. On the first floor there is a large art-room, 31ft. by 18ft., and a class-room 22ft. 3in. by 12ft., with an art master's-room adjoining. The building is of Bridgwater bricks, with Bath stone facings, and is 5ft. higher than the town hall. The designs were by Mr. E. J. Legg, borough surveyor, and the contractor was Mr. F. Jenkins. The cost has been £1,410 apart from interior fittings, &c.

ECCLESHALL, SHEFFIELD.—The foundation-stone of the new cottage homes, which are being built for the Eccleshall Board of Guardians, was laid on Friday. The homes are being built on the moorland in Bole Hill-lane, Redmires-road. The site is at an altitude of 950ft. above the sea level. Accommodation is provided, to commence with, for 78 children, six boys and six girls to live in each house. The houses are arranged in two lines with a wide space laid out as gardens between them. Each semi-detached house, of which there are six, will contain a living-room or kitchen, 18ft. 6in. by 15ft., scullery 13ft. by 11ft., bathroom and lavatory, grocery, larder, clothes stores, and hall on the ground floor, and on the first floor there will be two dormitories, one for boys and one for girls, each containing six single beds and mother's bedroom. An isolation or spare bedroom is provided in each house. Each cottage has self-contained out-building and offices. There will also be a detached isolation block. The superintendent's house is near the main entrance from Bole Hill-lane, and will contain the committee-room. On the right and left of this house will be two stores 42ft. by 17ft. Stables are also provided, and a water-tower to supply the homes from the Sheffield town water. The site has been laid out and the plans prepared by Messrs. Holmes and Watson, architects, Sheffield, and the contract let to Messrs. Wilkinson and Sons, Guernsey-road, Sheffield. The amount of the contract is £16,000.

EDINBURGH UNIVERSITY.—During the summer a number of improvements have been made on the equipment of the University, designed to keep it abreast of the day as one of the great teaching institutions of the country. The departments dealt with have been the library, in the old university, and the chemistry, pathological, and anatomy rooms, in the new university. Competing designs were submitted for utilising the present space in the library, so that there could be got into it shelving not only for the 230,000 volumes of which the library consists at present, but for another 400,000 volumes. The one finally selected is by the Art Metal Construction Co., of Jamestown, New York. A contract has been taken by this company to fit up four rooms with their improved library standards and shelvings, and at present an installation of one room has nearly been finished. This apartment is 23ft. 6in. by 22ft. 6in. by 20ft. high, and under the new arrangements it will be made to hold about 45,000 volumes. It has been divided into two stories, the lower 8ft. high and the upper 12ft., with a glass flooring between them, and the electric light has been hung from the roof between the bookshelves. The standards and shelves are made of rolled steel plate $\frac{1}{4}$ in. in thickness. The faces of the standards are rounded, and these and the sides have insertions cut in parallel lines at intervals of an inch to receive the shelves, which are also of the same material. The space that would have been taken up by the heavy wooden frames is thereby saved. At the chemistry laboratories a new hall, 52ft. by 45ft. and 18ft. in height, has been provided, and another hall, 42ft. by 39ft., has been added to the pathology department. These and other improvements have been carried out from designs by and under the supervision of Mr. Allan E. L. Clark, clerk of works at the university, with the exception of the extension of the pathological department, the plans for which were prepared last year by Sir Rowand Anderson.

NEWCASTLE-ON-TYNE.—A group of car-sheds has been built at Wingrove for the Newcastle Corporation. The sheds were designed by Mr. A. E. le Rossignol, engineer and manager of the tramways, and the work has been carried out under the direction of Mr. Alfred Oxley, building superintendent of the Tramways Department, with Mr. R. B. Richley as clerk of works. The contract is being fulfilled by Mr. William Worley, jun. The shed is 340ft. long, and it has a temporary end towards the north, so that extension may be readily made upon ground that already is the property of the corporation, if, or rather when, the necessity should arise. The length of the building runs from south to north, with the opening into Westgate-road. It is parallel with Wingrove-avenue. There are two spans, each 37ft. wide, with a row of 27 hollow cast-iron columns between. The average height is about 25ft. There are to be six tracks, so that it will be seen, by a simple arithmetical calculation, that there will be accommodation for sixty-eight 30ft. cars, or for about fifty of the larger type. The shed is constructed throughout of steel, wrought iron, and concrete, and it is stated that the materials are all of British provision. The metal work comes from Messrs. Swinney Bros., of Morpeth, and there is, in the whole building, nearly a hundred tons of it. The concrete is mixed at the place by an automatic process. The roof, which has 54 wrought-iron principals, is supported on concrete walls, with steel stanchions at intervals; the adhesive quality of the concrete being increased by an iron interlacing. Concrete pilasters are built round the stanchions. Wooden shutters are placed from stanchion to stanchion, inclosing a space between, and into this space the concrete is poured, making a homogeneous wall. The concrete used is a four-to-one mixture.

PERRY BARR, BIRMINGHAM.—The Birmingham Crematorium was formally declared open by Sir Henry Thompson on Thursday in last week. It is situated at Sheldon Coppice, near Rokeby Lane, three and a half miles from the centre of the city on the main road to Walsall, and is of ecclesiastical character, carried out in brick and stone, with tiled roofs. It stands in the centre of grounds laid out with trees, turf, and shrubs. The size of the chapel itself is 50ft. long by 25ft. wide, and about 40ft. high to the ridge, with an open-timbered roof, the total length of the building being about 107ft. On one side there is a vestry and registry office with a separate entrance, and on the other side a small mortuary chamber. The chapel is principally lighted by lofty clerestory windows, and underneath these on both sides are recesses for the reception of cinerary urns. The catafalque is against the end wall opposite the entrance, and stands on a stone platform approached by two stone steps, and immediately beyond the catafalque are the iron doors leading to the ante-chamber between it and the furnace, the level of which is the same as the catafalque. After the committal service, the coffin is noiselessly removed from the catafalque by invisible mechanical means on to a carriage, from which it is passed to the furnace, which is a regenerative gas furnace. The apparatus consists of two portions, one in which ordinary coal-gas is produced, and the other the incinerating chamber, where the gas is burned with an admixture of air to complete the cremation. The air is forced into the chamber by blowers, through a series of heating tubes, in which it is raised to a high temperature by the waste heat from the incinerating chamber. The ashes, untouched by human hands, are removed through a small aperture into the urn placed to receive them. The steam for working the blowers is produced from a tubular boiler of sufficient capacity to permit of the working of a second cremating furnace should it be found desirable to add one in the future. The total cost of the crematorium, including land, chapel, furnaces, and lodge, has been about £6,000. Mr. Frank B. Osborn, F.R.I.B.A., Bennett's Hill, Birmingham, was the architect, and Messrs. Wilcox and Raikes, of Temple-row, Birmingham, were the engineers. The contractors were Messrs. John Barrsley and Sons, of Ryland-street, Birmingham, and Mr. Thorniloe was the clerk of works. The outlay has been £6,000.

The Board of Education have received a communication from the Foreign Office intimating that an International Fine Art and Horticultural Exhibition is to be opened at Düsseldorf on May 1, 1904. A hope is expressed that England will contribute largely to this exhibition.

PROFESSIONAL AND TRADE SOCIETIES.

THE INSTITUTION OF CIVIL ENGINEERS.—The Council of the Institution of Civil Engineers have, in addition to the medals and prizes given for communications discussed at the meetings of the Institution in the last session, made the following awards in respect of other papers dealt with in 1902-3:—A Telford Gold Medal to George Deuchars (London); Crampton Prizes to A. B. Brady (Brisbane) and G. Maxwell Lawford (London); Telford Premiums to T. Johnstone Bourne (Tientsin), R. H. Rhind (London), H. T. Hinks (Marikuppam), G. A. Hobbler (Cairns), A. J. Goldsmith (Brisbane), F. H. Frere (Derby), R. Appleyard (London), P. Hamilton, B.Sc. (London). For Students' Papers the awards are:—The "James Forrest" Medal and a Miller Prize to Wanda Thompson (Burton-on-Trent); the "James Prescott Joule" Medal and a Miller Prize to I. V. Robinson (West Hartlepool); Miller Prizes to H. A. Bartlett (London), J. D. Morgan (Glasgow), H. S. Watson (London), J. V. Thomas (Gloucester), O. B. Rattenbury (Doncaster), and C. M. Skinner (Newcastle-on-Tyne).

THE LAND AGENTS' SOCIETY.—The annual meeting of the Land Agents' Society was held in London on Friday. Col. Halifax Wyatt, the president, occupied the chair. The meeting was well attended, and several important subjects relating to the management of the society were discussed. The council's annual report shows a marked increase in the membership, and substantial progress in the work of the society. Mr. E. G. Wheeler, commissioner for the Duke of Northumberland, was elected president for the ensuing year, and Mr. Dudley W. Drummond was elected vice-president.

LIVERPOOL ARCHITECTURAL SOCIETY.—The first ordinary meeting of the members of this society was held on Monday evening, in the New Laboratory, Harrington-street, when the presidential address was delivered by Mr. John Woolfall, F.R.I.B.A. In the course of his remarks Mr. Woolfall said it was a matter for congratulation from an architectural point of view that the City Council were exerting themselves in many large schemes, and that the Dock Board were about to build a magnificent block of new offices; and that their municipal rulers were determined to beautify the city. He hoped they would watch the streets which lead to the site of the proposed cathedral, as opportunities might occur for the making of a grand thoroughfare from the centre of the city. He would like to see new law courts built in the city, and St. George's Hall used as a people's hall, with exits to the new terrace and gardens adjoining, and where music could be heard the year through. He believed that the Art Gallery would have to make room for a larger and better building. Concluding, he emphasised the importance of erecting residential flats for the accommodation of the middle classes.

The Abram Cottage Hospital, near Wigan, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The supply of water from Lake Vyrnwy furnished by the Liverpool Corporation to the townpeople of Wallasey was formally inaugurated on Saturday. To conduct the water from the Liverpool aqueduct to the Gorse Hill reservoir—a distance of about three miles—a main has been laid by the district council at a cost of £17,500, whilst a further sum of £27,000 has been borrowed for the construction of a new reservoir adjoining the existing one at New Brighton.

At Tynemouth the monument which has been erected to record the names of the soldiers of the place who served during the war in South Africa was unveiled by the Right Hon. W. Brodrick, M.P., on Friday. The monument has been designed by Mr. Arthur B. Plummer, architect, Newcastle, and the sculptor is Mr. Robert Beall, of Newcastle. It is of red sandstone, and stands in front-street, its height being about 12ft. It is Renaissance in treatment, and consists of a square pedestal raised on two steps; above this is a smaller die, and a high pyramidal finial.

At the Incorporated Law Society's congress at Liverpool, on Tuesday, Mr. J. S. Rabinstein read a paper on "The Blight of Othelloism," with special reference to the working of the new experimental system of compulsory registration of title under the Land Transfer Act of 1897, which since Jan. 1, 1899, has been on trial in the county of London.

WATER SUPPLY AND SANITARY MATTERS.

AN EPIDEMIC AT CHELMSFORD.—Dr. J. C. Thresh, medical officer of health to the Essex County Council, has issued a report on an extensive epidemic of diarrhoea which broke out in August last in Chelmsford and the adjoining village of Widford, and which he found to have occurred only in districts supplied with mixed waters derived from two sources, the smaller of which gave evidence of having been contaminated while in a tank reservoir. Further investigations showed that the plans prepared by the late borough surveyor, recently deceased, for the protection of the tanks had not been adhered to. Had they been carried out as originally prepared, pollution would have been impossible; but Dr. Thresh is unable to say who is responsible for the altered construction.

LEGAL INTELLIGENCE.

IN RE E. MESSITER.—At Bankruptcy Buildings, W.C., on Friday, the first meeting of the creditors was held under a receiving order made against the estate of Edward Wade Messiter, builder, of 9, Wilbraham-place, Sloane-street, S.W. Mr. G. W. Chapman, Official Receiver, presided. A statement of affairs was filed showing gross liabilities £134,177 3s. 2d., of which £122,220 was returned as fully secured, and £11,929 19s. 8d. as expected to rank, and assets estimated to produce a surplus of £16,748 2s. 5d. The debtor states that he has been adjudicated a bankrupt on two occasions, namely, in 1882, when he was engaged in the timber trade, and in 1890, whilst trading as a licensed victualler, but he obtained his discharge from both proceedings. He commenced business as a builder in the year 1897, with a capital of £1,000, and has been engaged in building operations at Wilbraham-place, S.W., and at Fulham. He attributes his present position to inability to obtain loans upon leaseholds which had been promised him, insufficiency of capital, and general depression in financial matters consequent upon the war. An adjudication of bankruptcy having already been made, and no proposal of composition being submitted, Mr. Albert Willmott, A.C.A., was appointed trustee of the estate, with a committee of inspection.

IN RE McDOWALL AND NEILSON, TIMBER MERCHANTS, GLASGOW.—The meeting of the creditors of Messrs. McDowall and Neilson, timber merchants, was held in Glasgow on Friday. Mr. Charles E. Poynter, of Messrs. Arthur Dobell and Co., Liverpool, presided. Mr. Robert Reid, C.A.T., official factor on the estate, said that he had taken the necessary steps to secure that the creditors' rights to the stocks of timber should be preserved, and under his supervision the valuation of the whole assets had been prepared. A statement of affairs was submitted showing unsecured liabilities amounting to £99,325 8s. 5d., and free assets to the amount of £6,972, the deficiency being £92,353 8s. 5d. In the event of the rights of the trustees to several cargoes of wood, and the questionable security claims being maintained, these would bring into the general estate other £12,046 of assets.

A WORRIED PLASTERER LOSES HIS CASE.—At the Newcastle-on-Tyne County-court on Monday, James Fallon, plasterer, claimed damages from the Plasterers' Trade Union for having conspired to interfere with him in his employment. The plaintiff alleged that the society imposed a fine upon him for having worked on a "non-society job," and that when he refused to pay it the society induced his employers to dismiss him under a threat that if he was not discharged the members of the society would be withdrawn from work. One employer, however, stated that he was dismissed for asking a "sub," and another because work was short; though the former said that the plaintiff would probably have been dismissed because of trouble with the society. He added that an employer could not live in Newcastle with non-union men. Judge Greenwell, in finding for the defendant society, said the society had undoubtedly worried the plaintiff, but he was unable to see that he had suffered any damage or had any cause of action.

ARBITRATION CASE AT LEITH.—The proof in an arbitration in connection with a claim for £12,000 by the trustees of the late John McFarlane, United Wire Works (Limited), Leith Walk, took place on Friday and Saturday in the S.S.C. Library, Parliament House, Edinburgh. The Caledonian Railway Company have compulsorily acquired property belonging to the trustees in connection with the formation of a new goods station at Stead's Place, Leith Walk. The arbiter for the claimants was Sheriff Jameson, instructed by Messrs. G. M. Wood and Robertson, S.S.C., and for the Caledonian Railway Company, James Watts, W.S., of Messrs. Davidson and Syme, instructed by H. B. Neave, solicitor to the company. The oversman was Charles J. Guthrie, K.C. The witnesses examined on Friday for the claimants were G. Lennox Beattie, W. Galloway, George Smellie, Glasgow; and William Ormiston, late Dean of Guild. On Saturday the railway company's witnesses, T. P. Mar-

wick, architect; George Simpson, burgh assessor, Leith; Frank Burnet, and Thomas Binnie, of Glasgow, and others, were examined.

WATER BOARD ARBITRATIONS.—At the meeting to-day (Friday) of the Metropolitan Water Board, the special arbitration committee will recommend the adoption of agreements with the Tottenham and Enfield District Councils for the acquisition of their water undertakings respectively for the sums of £77,750 (against £103,452 claimed originally) and £66,000 (against £121,000 claimed originally). Tottenham will have to discharge outstanding loans, debts, &c., amounting to £48,000, out of the sum received, and Enfield liabilities amounting to £57,000. In each case the Water Board will pay smaller sums in addition for capital expenditure undertaken by Tottenham and Enfield since negotiations were initiated.

CHIPS.

The architect of the new workhouse infirmary for the Stockport Board of Guardians, of which, as we mentioned last week (p. 476), the foundation-stone has just been laid at Stepping Hill, Hazel Grove, is Mr. W. H. Ward, of Birmingham. The work is being carried out by Mr. Daniel Eadie, contractor, of Stockport, the contract entered into with the guardians amounting to £39,980, equivalent to about £120 per bed.

On Thursday in last week a stained-glass window, which has been placed in the Church of St. Barnabas, Gillingham, Kent, in memory of the late Dr. E. H. Hugo, was unveiled. The window is situated behind the altar, and represents our Lord in Majesty, surrounded by representatives of the Church and Holy Angels.

The new branch stores which have been erected at Walbottle by the Throckley District Co-operative Society, Limited, the work having been carried out by Mr. John Jackson, contractor, Newcastle-on-Tyne, were formally opened on Saturday. The architects are Messrs. Liddle and Browne, of Newcastle.

On Friday Colonel Durnford, one of the inspectors of the Local Government Board, held an inquiry at the public offices at Skegness with respect to an application for sanction to a loan of £10,360 for the purpose of the completion of a sewerage scheme, to embrace the whole district, including the growing district of the Seacroft estate at the south end of Skegness, where the golf links are situated. The details of the scheme were described by Mr. Elliott, of Messrs. Elliott and Brown, of Nottingham, the engineers.

The new parish hall for St. Mary's, Bridgewater, was opened by the Bishop of Bath and Wells last week. It has been built by Messrs. Gleed Bros., of Bridgewater, from plans prepared by Messrs. Samson and Cottam, the contract for the work being £800.

As a memorial to the Rev. North Pinder, rector of the parish from 1860 to 1901, improvements and additions have been made to the church of Rotherfield Greys, near Henley. These consist of a stained-glass window of two lights representing the B.V.M. in St. John's house at Ephesus, and a new altar carved by Messrs. Harry Hems and Sons, of Exeter. Advantage was taken of the opportunity to rescue the ancient 14th-century brass of Sir Robert de Grey from the place to which it had unfortunately been relegated at the restoration of the church many years ago, and refix it in the centre of the chancel.

The Local Government Board has sanctioned an extension of the boundaries of the borough of Portsmouth, by which the whole of Portsea Island will be brought within the control of the Corporation.

The Museum of Practical Geology in Jermyn-street, which has been closed for redecoration, has been reopened to the public during the usual hours, including Saturday and Monday evenings and afternoons.

An important discovery of a Roman sculptured stone has been made in Sunderland by Mr. John Robinson, a local antiquary. It is the first example of Roman sculptured work found at Wearmouth; it is built into the only remaining wall of the old rectory buildings, made famous as the residence of Archdeacon Paley. The stone measures 2ft. 7in. by 12in.; it is much weather-worn, yet the letters V. S. L. M. are quite distinct, as well as one portion of a beautiful ornamental scroll. The initial letters are the usual terminal inscription found on Roman altars—*Votum Solvit Libens Merito*.

The Mayor of Deptford laid on Wednesday the foundation-stone of a new Town Hall for the borough, which is to be erected on a central site in the Newcross-road. The building is to cost £30,000. The builder is Mr. H. L. Holloway, and the architects are Messrs. Lanchester, Stewart, and Rickards, whose design, selected in competition, was illustrated in the BUILDING NEWS for Oct. 24 and Nov. 14, 1902.

PROPOSED NEW CHURCH, MIDDLESBROUGH.

THIS is a design submitted in competition for a proposed new church at Middlesbrough. The conditions were that the church should accommodate 800, and it was suggested that the building should be carried out in a Romanesque treatment. The materials proposed to be used were local red brick for walling with dressings, piers and arches of Danhouse stone, and terracotta. The roof of nave to be covered with Westmoreland green slates, and of apses with Broseley red tiles. The estimated cost, exclusive of upper part of tower, was £10,000. The architects are Messrs. R. Lofthouse and Sons, Middlesbrough.

SHIPTON COURT, SHIPTON-IN-WYCHWOOD, OXFORDSHIRE.

THIS fine old typical mansion, which we illustrate from drawings shown at the Royal Academy this year, was erected in 1603. At a later date, the mullion windows having decayed, the building was restored in the Georgian manner, sash windows being inserted, deal panelling and other finishings provided, and various alterations of the plan effected. In the present restoration (1903) the sash windows being decayed, new stone mullion windows in conformity with ancient work have been introduced. The walls strengthened and repaired, and additions made to adapt the old building in every respect for use as a convenient modern residence, with new oak panellings, plaster ceilings, and fitted bedrooms, modern sanitation, water supply, and electric light. The additions to the mansion are a winter-garden, a billiard-room with private office and workshop under, a tower, with cisterns for water storage, a new porch, and extension of the kitchen offices. There is an extensive range of stabling which has been restored and brought up to date, and new cottages erected for coachman and gardener. Every effort has been made to retain the effect of old work, which is much assisted by the fine old yew hedges, and the laying out of the ancient gardens. The work has been designed by and carried out under the personal supervision of Mr. G. B. Bulmer, R.R.I.B.A., of the firm of Messrs. Perkins and Bulmer, architects, Leeds.

A SURREY RESIDENCE.

THIS house has been erected near Sidlow, Reigate, from the plans of Mr. C. E. Salmon, architect, Ball-street, Reigate, whose drawing, now given, was in this year's Royal Academy. The ground floor is faced with local red facing bricks (Trowers). The upper portions hung with weather tiles. All the tiles for roofs and hangings are red sand-faced hand-made tiles from Messrs. S. E. Collier, of Reading. The lead lights and lead work designs were specially made. The spandrels of the large circular

headed window lighting hall were built of T.L.B. rubbers, and carved by Messrs. T. L. Bradford and Sons to cartoons by the architect. The sills are of Box Ground Bath stone to an appropriate section. All the oak panelling in hall and billiard-room, as well as oak staircase, was supplied and executed by the contractors, from the architect's details. The contractors were Messrs. W. Bagaley and Sons, of Mead Vale, Redhill.

PUBLIC BATHS AND WASHHOUSES, OLD KENT ROAD.

THIS building, illustrated from a drawing shown this year at the Royal Academy, is now in course of erection, and the present design is a modification of the one submitted in competition, and which was illustrated and described in the BUILDING NEWS of March 28, 1902. The plinth is of Blue Forest of Dean stone, and the remainder of the stonework is Portland. There are brick facings to front and side elevations, and the slating will be green Tilberthwaite. The architect is Mr. E. Harding Payne, A.R.I.B.A., of 11, John-street, Bedford-row, W.C., and the builder Mr. A. N. Coles, of Plymouth. Mr. Wm. Lake is the clerk of works.

GORDON MEMORIAL HOME, NOTTINGHAM.

THIS home was founded in memory of Major General Charles George Gordon, C.B. The foundation-stone was laid with Masonic ceremony by his grace the Duke of Portland, Provincial Grand Master, on August 5 last. Accommodation will be provided for 104 boys. In the basement are arranged a large recreation and drill hall, cloakrooms, drying-rooms, day lavatories, boot-cleaning and brushing rooms. The library and waiting-rooms face the street. On the ground floor is the dining-hall, with kitchen, scullery, larder, &c., adjoining. The committee, waiting-room, &c., are on the south side of the principal entrance; the office, master's and matron's rooms on the north. On the first floor accommodation is provided for 52 boys in two dormitories, with lavatory and bathroom adjoining. The hospital-room, with separate bath and w.c., are placed on this floor; also the master's and matron's bedrooms. On the second floor similar accommodation is provided in the dormitories and the staff bedrooms. Fire-escape staircase is provided from the dormitories. The walls externally are of red brick, with Derbyshire-stone dressings. The contractor is Mr. F. Messom; the mason, Messrs. Ward and Adkins; plumbing and sanitary work, Messrs. Humphrey and Co.; the architect, Mr. Ernest R. Sutton, Bromley House, Nottingham. The drawing was hung in the Academy of this year.

AN OLD FRENCH RENAISSANCE WARDROBE, CHEST, AND CHAIR.

THERE is not much to say about these three pieces of furniture, which are self-explanatory. The largest of the three was evidently designed to harmonise with the wall panelling of the room for which it was intended, and no doubt formed an essential feature in the apartment, though the arrangement of the central panel, which has an applied look more free than commendable, hardly befits a door treatment, more notably in the way in which the base of the panel is managed. The columns and their pedestals also are borrowed in idea too much from stone features, while the niches behind are more fanciful than good. In earlier work such vagaries had not been invented.

The Annual Conversazione of the Architectural Association will be held at the Royal Institute of Painters in Water Colours, Piccadilly, on Wednesday week, Oct. 23, at 8 p.m. A selection of students' work and prize drawings will be exhibited.

Lieutenant-General Lord Methuen on Saturday afternoon unveiled the memorial stone of the St. Matthew's, Bethnal Green, parish building. The new building is being erected on a part of the rectory garden, and will cost £3,000. On the first floor it provides a parish hall, which will accommodate 400 people, and can be used as a gymnasium and as a place for meetings and concerts, while on the ground-floor there are two sets of club-rooms, one for boys and one for men.

The Gas Committee of the Glasgow Corporation considered, on Monday, the short list of candidates for the gas managership, vacant by the death of Mr. Foulie. After discussion, it was decided to recommend the appointment of Mr. Alexander Wilson, at present manager of the works at Daws-helm. The salary attached to the position is to be £1,000 per annum.

COMPETITIONS.

CHRISTIANBURG, DENMARK.—The Bill just introduced in the Danish Folkething for the rebuilding of Christianborg Castle provides for the appointment of a commission which is to institute a competition for plans of the new building. About £550 is the highest premium. The Castle will be utilised for Court functions, for the reception of Royal visitors, and for the meeting of the Rigstag. The outlay on the building, exclusive of decorations, is estimated at £333,000.

HEYWOOD.—The drawings received by the committee in connection with the competition for a public free library will be on view to the public and competing architects in the lecture-hall of the Technical School to-day (Friday) and to-morrow from 10 a.m. to 9 p.m. Mr. J. Ainsworth Settle, A.M.I.C.E., the borough engineer of Heywood, informs us that sixty sets of designs have been sent in.

CHIPS.

By the death of Mr. George Gilbert, the brother of Sir John Gilbert, R.A., who made a munificent gift of works of art to the City Corporation some years ago, the permanent collection of pictures in the Guildhall Art Gallery is likely to be augmented considerably. The deceased has bequeathed a number of water-colour drawings and oil-paintings, which were given to him by his brother, to the Corporation. In the event of the Corporation refusing the gift, the pictures will go to the Tate Gallery.

At the last meeting of the Metropolitan Public Gardens Association a further letter was read from the London County Council declining to contribute to the acquisition of St. Peter's-square, Hammersmith, a fine enclosure of 1½ acres in extent, which is in danger of being built over, owing to the high price, £12,500, asked. It was considered that every effort ought to be made to prevent the obliteration of London squares, and that the Council should be asked at what price it would be prepared to assist in the purchase.

The dissolution is announced of the partnership hitherto existing between H. B. Leigh and W. H. Rayner, Lillie-road, Brompton, S.W., under the style of Ellis Leigh and Co., architects, &c., and Finborough-road, South Kensington, S.W., under the style of Brooks and Co., builders, &c.

Mr. P. C. Cowan, chief engineering inspector to the Local Government Board for Ireland, has held an inquiry in Dublin relative to an application of the corporation for sanction to loans of £76,000 and £8,238 for the purpose of defraying extra expenditure in connection with the electric lighting scheme, and carrying out wood-paving, asphaltting, and concreting works generally. Mr. Robert Hammond, of Westminster, consulting electrical engineer to the corporation, gave evidence in support of the application.

The resident engineer for the construction of the new marine drive and promenade round Scarborough Castle foot, in a report to the corporation, states that the undertaking will be completed early in 1905.

Only a limited amount of business was done at the Mart in Tokenhouse-yard last week. Weekly rents were much in evidence, and this class of property changed hands freely, but, with the exception of a large piece of land at West Ham, which at £15,000 was withdrawn, scant attention was paid to the higher-priced investments. The returns amounted to only £33,800, which represent exclusively property sales. The sales at the Mart for the corresponding week of last year amounted to £89,635.

The new Town Hall at Oundle was opened by Lord Lilford on Wednesday week. The building, which faces West-street, is entirely of stone, with Weldon facings. The main room is 60ft. by 40ft. in dimensions. There is an elevated platform, 13ft. deep, with footlights, beneath which is a dressing room. A large gallery is reached by a flight of stairs, with pitch-pine rails and oak balustrade. The cost has been £2,500. Messrs. Siddons and Freeman were the builders, and Mr. J. Corby, of Stamford, was the architect.

The commission which is to have in hand the building of Mr. Carnegie's temple of peace at The Hague has been elected, and has held its first sitting. The Dutch architects have coolly asked the Minister to promise that the architect to be entrusted with the work, which is to cost £300,000, shall be a Dutchman.

A stained-glass window has been set up by the family to the memory of Mr. Charles Hill, of Clevedon Hall, in the baptistry of Bristol Cathedral, under the south-west tower. The window shows the continuity of the baptismal rite under the old and new dispensations and on to the final establishment of Christianity in England.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STANCO NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserv, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLI., XLVI., XLIX., LI., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. 25s. of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—W. E. C.—B. M. and Co.—H. C. (Bolton).—F. W. M.—R. S. and Sons.—W. M. B.

E. C.—The composition you mean we expect is Szerelmey's. Write Szerelmey and Co., 217, Rotherhithe New-road, London, S.E.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"White Heather."

H. SUTTON.—The covered playground can be in the half-basement under part of the building for the second dry school, which is itself to be arranged in two floors—one ground floor and one the first floor, as stated in the conditions.

H. SCHLIPPE.—We have already stated in reply to correspondents on Oct. 2, p. 413, that the plans of the school may be drawn to 1/16th of an inch scale, keeping to the 1/16th scale for elevations and sections.

Correspondence.

COMPETITION REFORM SOCIETY.

To the Editor of the BUILDING NEWS.

SIR,—Re Competition for additions to Jeffs' Poplar Hydro, Matlock Bank. The Committee disapproves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reasons: No professional assessor. The Council

do not bind themselves to adopt or carry out any of the designs submitted, &c. Premiums insufficient.

Re Competitions for (1) shops and workmen's dwellings, Burch of Kilmarock; (2) public library, Coedfranc, Skewen; (3) pavilion and winter gardens, Bray, County Wicklow. The Committee disapproves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reasons: No professional assessors. Insufficient premiums. The promoters do not bind themselves to adopt or carry out any of the designs submitted, &c.

Architects are requested to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised.—I am, &c.,

HENRY A. SAUL, Hon. Sec.

10, Gray's Inn-square, London, W.C., Oct. 13.

CONSTRUCTION OF DRAINS—STRANGE STATE OF THE LAW.

SIR,—On Oct. 6, the Sheffield stipendiary decided (in a case prosecuted by the corporation for breaking their by-laws) that all rain-water pipes and waste pipes must be trapped immediately they reach the ground, as the point where it enters the ground is the inlet to the drain under the model by-laws, notwithstanding that at some distance away all such waste and rain-water pipes emptied into a disconnecting gully next the drain from the w.c., and further, that, as the bottom of a rain-water pipe is next the wall, there the gully must be.

This decision is against the modern method of collecting waste pipes and rain-water pipes to one central disconnecting gully; and if it is correct law—which I very much question—our sanitary laws are in a deplorable condition. Can any of your readers refer me to any Court cases on this point affirming, or otherwise, this decision, or inform me whether the disconnection of wastes, &c., in model by-laws does not implicitly mean disconnection from the pipe or drain conveying liquid and solid fifth—i.e., from w.c.'s and slopsinks?—I am, &c., JAMES G. D. ARMSTRONG, Sheffield. Mem. San. Inst.

At Tuesday's meeting of the London County Council a recommendation of the Bridges Committee for the reconstruction of Lambeth Bridge at an estimated cost of £872,000 fell through, the necessary two-thirds majority not being obtained on a motion for the suspension of standing orders; but an estimate of £1,340,000 for the construction of a tunnel under the Thames between Rotherhithe and Shadwell was approved after discussion.

The Local Government Board have notified the Bromsgrove Rural District Council of their sanction for a loan of £7,445, for the carrying-out of schemes for draining Hagley and Blakedown.

Mr. W. McIntosh, engineer and surveyor to the Cuckfield Rural District Council, has been appointed surveyor to the West Sussex County Council, at a salary of £250 a year.

At St. Albans a new Congregational church, built at a cost of £11,400, was opened on Thursday in last week. It is situated at the junction of Victoria-street and Beaconsfield-road, and is seated for 700 persons. Messrs. Smee and Mence, of St. Albans, were the contractors, and Messrs. Miskin and Son, of the same city, were the builders.

Lord Brassey, on Thursday night in last week, opened the new village hall which he has presented to the parish of Catsfield, Sussex, where Normanhurst is situated. The building is of red brick surmounted with rough casts. On the ground floor is a room for entertainments, and above are billiard, reading, and committee rooms.

Founder's Day at Harrow, celebrated on the 8th inst., was rendered memorable by the dedication by the Bishop of London of the addition made to the school chapel in memory of those Harrovians, 55 in number, who lost their lives in the late war in South Africa. At a cost of £8,820, transepts have been added to the chapel on either side of the chancel. Porches have been built at the two main entrances, the big western door having been moved to the south side of the chapel, exactly opposite to the main north entrance. The architects were Mr. Aston Webb, R.A., and Mr. Ingress Bell. In each transept a sculptured memorial has been placed, showing the names of those in whose memory the fund has been raised, the figures of St. George, St. Michael, St. Andrew, and St. Patrick, which are to be placed round the tablets, being sculptured by Mr. Drury, A.R.A. The chapel dates from 1857, and the south aisle was a memorial to those officers educated at Harrow who fell in the Crimean War.

Intercommunication.

QUESTIONS.

[12013].—Old Coffins.—Old stone coffins are, of course, numerous. Are there, however, any instances of Medieval coffins cut out of solid wood?—SHARPE.

[12014].—Half-Timber Work.—I am desirous of covering a wall with half-timber and plaster in the old black-and-white style. The timbering to be 2in. in thickness, and varying from 4in. to 7in. wide, with 1in. thick plaster panels between. I should prefer oak, but fear it is too expensive, so should be very glad if anyone would suggest what is the next best substitute that can be stained nearly black to match some real old work adjoining.—ARTIST.

REPLIES.

[12010].—Smoked Bricks.—Try weak solution of spirit of salt, or chloride of lime, or ammoniacal liquor, or cream of tartar.—REGENT'S PARK.

[12011].—Electric Lighting.—You would be able to charge up to about twenty cells with your 55v. dynamo. (1) No; because there are no Nernst lamps made of so low a voltage as 55v. (2) No; because the voltage of the thirty cells exceeds that of the dynamo. (3) Better have a proper automatic gas governor. (4) One containing two lever switches, one ammeter, and one voltmeter. See my book, "A Guide to Electric Lighting." (5) No; a good shunt will suit you better, because of charging the accumulators. (6) No; the speed is too great, and as they are not running through the air, they soon get frightfully hot. (7) Yes.—S. BORTONE.

[12011].—Electric Lighting.—See that engine has a good flywheel. (1) You can, and they are very economical, but must have no great fluctuation in voltage. (2) Yes. (3) Yes, and very desirable if well constructed. (4) Each one is the same in the essentials, differing in details. Maker will give you instructions for fixing. (5) A compound dynamo is the best for lighting direct, as it is practically self-regulating. Cut out series winding when charging accumulator. (6) Don't know what you mean. (7) Yes, you can; but it would be much better to use one large one for the lot.—LOSA JOUX.

[12012].—Level.—"Surveying Instruments," by W. F. Stanley, of Great Turnstile, W.C., has several pages on ordinary and improved dumpy levels.—REGENT'S PARK.

CHIPS.

Mr. C. Lynam, F.R.I.B.A., has decided not to seek re-election on the Stoke-on-Trent Town Council, of which he is one of the oldest members, but he has responded to the unanimously expressed wish of his colleagues to accept the mayoralty for next year.

At the meeting of the Architectural Association Camera and Cycling Club on Wednesday evening, held at 56, Great Marlborough-street, W., a lecture on "Little Known Irish Abbeys," illustrated with numerous slides, was given by Mr. H. Oakden Wayn, F.H.A.

Major Tulloch, Local Government Board inspector, held an inquiry at the Town Hall, Tamworth, on Tuesday, respecting the application of the Tamworth Rural District Council for sanction to borrow £600 for the purchase of land in the parish of Glascoate, and £1,800 for the erection thereon of workmen's cottages, stabling, &c., for the house refuse and nightsoil department. There was no opposition.

A new Primitive Methodist Chapel was opened at Castletown, near Sunderland, on Saturday last. The new building is of brick with stone facings. It has accommodation for 240 people. The building was designed by Mr. J. H. Nicholls, architect, Sunderland, and the contractor was Mr. Morris Wright, of Monkwearmouth.

The town council of Wolverhampton, after a discussion extending over several hours, adopted, on Monday, the report of their tramways committee, recommending the adoption of the Lorain system of stud contact throughout the whole of the borough.

At the meeting of the electric-lighting committee of the York Corporation on Monday, it was reported that the sanction of the Local Government Board had been received to a loan of £10,850, for the purposes of extensions at the works, and electric lighting generally.

A special court of the Corporation of the President, vice-Presidents, and Governors of King's College Hospital will be held in the large theatre of King's College, Strand, on Monday next, at 4 p.m., for the purpose of obtaining the sanction of the members of the said Corporation to the removal of the hospital from its present site to a site in South London. This proposed removal is put forward at the initiation of both the Council and Committee of Management.

Mr. James Buchanan, of the general manager's department of the North British Railway, has been appointed manager of the northern section of the Cape-to-Cairo Railway at a salary of £1,200 per annum.

The Exeter Education Committee have retained Mr. J. W. Jerman as architect at a salary of fifty guineas a year, with a commission of 5 per cent. on new works or new buildings.

STATUES, MEMORIALS, &c.

DURHAM CATHEDRAL.—A memorial has just been placed over the remains of Bishop Richard d'Angerville (or de Bury) in the Nine Altars of Durham Cathedral. The whole cost of the work has been defrayed by members of the literary Grolier Society of New York, who desired that there should be something to mark the resting-place of the bones of one who was one of the very earliest friends of literature in Europe. This monument, designed by Mr. G. H. Kitchen, has been executed under the eye of Messrs. Vokes and Beck, sculptors, of Winchester, by Mr. John McCusham, an Irish artist. Bishop Richard was born in 1257, at a hamlet near Bury St. Edmunds, in Suffolk; hence comes his usual name of Richard of Bury. His surname of Angerville shows that he was not English in origin. Richard de Bury was Bishop of Durham from 1333 to 1345. In concluding a sketch of the bishop, the dean states that Richard was the third prelate, probably the third person, who was buried in the cathedral, and with regard to the memorial he writes:—"This beautiful piece of work deserves a word of praise and description. The thought of it comes from that fine specimen of Bishop Bury's seal which we have among the best treasures of the cathedral. From this the central figure was worked, in face, attitude, and vestments. The only change is in the book which the figure now carries under the left arm, a representation of the Philobiblon; this, far more than the pastoral crozier, is the characteristic feature of our prelate's life; the canopy under which he stands is simplified from that on the seal; and the two figures, each under his own canopy, represent Letters and Devotion. The inscriptions under these figures are from the fifteenth chapter of Philobiblon. At the four corners of the slab are shields carrying, two of them, the St. Cuthbert's Cross and two the three lions of England."

CHIPS.

Mr. John F. Smith, assistant burgh engineer, Wolverhampton, has been appointed burgh surveyor of Inverness.

The Kirkcaldy Town Council discussed, on Monday, the report of Sir A. M. Rendel, C.E., London, on the harbour extension scheme, the total cost of which he estimated at £107,000. The joint committee of the town council and Harbour Commission, to whom the report was submitted, recommended that the council approve of the scheme and proceed to make arrangements for obtaining Parliamentary powers to proceed with the work. The committee's recommendation was unanimously agreed to.

The model of the equestrian group for the summit of the Wellington Monument at St. Paul's, recently made by Mr. Tweed from the rough suggestions left by Alfred Stevens, not having met with the unqualified approval of the committee or of the public, it has been removed from the Cathedral. Mr. Tweed is now at work on a second model, which will not be a faithful rendering of the model that lay so long in the crypt of St. Paul's, but a freer interpretation of Stevens's intentions as gathered from his models and designs. When completed, this group will also be exhibited.

The city council of Nottingham at their last meeting adopted a joint report of the Water Committee and the General Works and Highways Committee, recommending the construction of a suspension bridge over the Trent, for the purpose of carrying water-mains and serving as a footbridge, at an estimated cost of £8,200.

At a general assembly of the Royal Society of British Artists, on Monday, the following were elected members:—W. B. Laund, Forbes Withersby, E. Anderson, Montford Paul, F. Carruthers Gould, Cave Day, and Fletcher Watson.

A meeting of the executive committee of the National Trust was held on Tuesday evening at the offices of the society, 25, Victoria-street, Westminster. An offer was made through Miss Octavia Hill of a gift of land comprising 3½ acres on the top of one of the Kentish Hills. The gift was accepted, and a vote of thanks to the donor passed.

Mr. J. H. Hughes, of Huddersfield, has been appointed resident engineer for the construction of the new reservoir above Blaenrhondda.

The City Corporation have agreed to pay to the Bridge House Estates Committee £50,000 for the ground belonging to the Estates required for widening London-wall and Blomfield-street between Albion-place and Finsbury House.

A meeting of clergy and laity was held at New-castle-on-Tyne on Tuesday, at which it was decided to raise a fund of £100,000 for the formation of three new parishes, the building of new churches, and for church extension work, necessitated by the growth of the diocese, the population of which has increased during the past 20 years by 200,000. It was announced that subscriptions amounting to about £25,000 had been promised or actually given.

STAINED GLASS.

WESTMINSTER ABBEY.—A new stained-glass window in Westminster Abbey was dedicated on Tuesday by the Bishop of Oxford. The window, which is placed in Poets' Corner, bears the formal title of "Translation of King Edward the Confessor," and represents incidents in the life of that Monarch. At the head of the window is a cinquefoil containing a shield bearing emblems of the Trinity, surrounded by angels holding a scroll. The lights contain two full-size figures under canopies, with six picture subjects beneath them, both lights being framed with wide architectural borders, having niches holding twenty-eight statuettes. In the left-hand light is the figure of King Edward the Confessor, the founder of the Abbey; in the right-hand light is that of St. John the Evangelist. The picture subjects, counting from the left and reading across, represent:—1st, the Coronation of King Edward the Confessor; 2nd, the building of the Abbey; 3rd, St. John the Evangelist in the guise of a beggar asking alms of the King, who, finding his purse empty, gives a valuable ring off his finger; 4th, a double picture, (a) St. John (in Palestine) handing King Edward's ring to a pilgrim, bidding him return it to the King, and announce to him his approaching end; (b) the pilgrim (in England) on bended knee, fulfilling his errand; 5th, the King on his death-bed; and 6th, the entombment of the King. The statuettes in the borders represent:—Left of left-hand light, reading from the top, Kings of England: Edward I. to Edward VII. Right side, Queens of England: Edith, Eleanor, Mary I., Elizabeth, Mary II., Anne, and Victoria. Left of right-hand light, reading from the top, St. Edwin of Northumbria, St. Oswald, King Alfred, St. Edmund, Henry III., V., and VII. Right side, Archbishops Theodore and Dunstan, Bishop Wulfstan, Archbishop Aeselm, Bishop Robert Grosseteste, and Archbishops Cranmer and Laud. The glass is the work of Messrs. Burlison and Grylls, acting under the superintendence of Mr. G. F. Bodley, R.A., and the scheme of subjects is due to Dr. M. R. James, of King's College, Director of the Fitzwilliam Museum at Cambridge.

The town council of West Hartlepool received and accepted at the last meeting the tender of resignation of Mr. J. W. Brown, for the past twenty years the borough engineer.

The death occurred at Brighton, on Friday, of Mr. John Thomas Pidditch, surveyor to the Battersea Borough Council. The deceased, who was about sixty-four years of age, had a paralytic stroke on Monday in last week, and died without regaining consciousness.

At Friday's meeting of the Herefordshire County Council the Education Committee reported that it had been arranged that the county surveyor should examine and report on the condition of the whole of the thirty-one council schools. Nearly one-half of these had been already reported upon, and in some cases considerable repairs were found to be necessary. In some instances alterations by the Board of Education had also been required.

New Wesleyan Sunday-schools were opened at Weaverham, Cheshire, last week. The buildings have cost £1,800, and provide an assembly-room 48ft. by 28ft., seating 230 children, and four large and two small classrooms. The style is Modern Gothic. Mr. A. Priest was the architect, and Mr. S. Appleton, of Northwich, the builder.

An alarming mishap occurred the other day at St. Simon's Church, Heaton-street, Hockley, Birmingham. The building, which is 60ft. by 20ft., consists of two stories, the upper floor being used for church services, and the lower as a schoolroom. Shortly after the caretaker had left the premises some heavy beams supporting the roof gave way, and brought down a quantity of masonry, wood-work, and plaster. The debris fell into a room which is used as the church.

Mr. James Bowden, of Oak House, Eudon, builder, an ex-Mayor of Burslem, and for thirty years prominently connected with public affairs, who died on August 16 last, aged sixty-five years, bequeathed to his brother, Mr. Robert Bowden, of New Mills, Stockport, joiner, his personal effects and the residue of his personal estate. His estate has been valued at £17,960 7s. 6d. gross, with net personalty nil.

A fire occurred on the 8th inst. at Crescent Foundry, Spilman-street, Mile End, London, owned and occupied by Messrs. Warner and Sons, bell founders. The flames started in a building of two floors about 200ft. by 40ft., used as workshops, pattern rooms, and stores, and the greater part of the structure was eventually gutted.

At the Bridlington Town Council meeting on Friday night £2,450 was voted for the erection of a new pavilion round the bandstand on the Parade. It was announced that the Local Government Board have granted permission to borrow £10,000 for the construction of the new Victoria sea-wall.

Our Office Table.

The sixteenth annual exhibition of pictures by members of the Yorkshire Union of Artists, and a display of works of applied art, was opened on Monday at the Leeds City Art Gallery, and will continue till January 2. The artists whose works are on view include Mr. A. Seord, Mr. Rowland H. Hill, Mr. P. Morton Teasdale, Mr. G. P. Carruthers, Mr. S. W. White, Mr. F. W. Jackson, Mr. F. Stead, and Mr. Brooke. Portraits and representations of Yorkshire scenery are prominent in the exhibition. There is a collection of water-colours in the east room, the contributors including Mr. J. D. Walker, Mr. W. Stephenson, Miss M. Wilson, Mr. H. S. Hopwood, Mr. A. W. Bayes, Mr. Rowland Hill, Mr. H. R. Oddy, Mr. John Sewden, Mr. W. E. Tisdall, Mr. Albert Kinsley, Miss Barran, Mr. J. W. Brooke, and Mr. F. W. Jackson. Arts and crafts specimens, jewelry, bookbinding, and Ruskin pottery are in the north room.

In connection with the Church Congress which is being held this week at Bristol, an ecclesiastical art exhibition has been opened at the Drill Hall in that city. It is the largest and most varied of the twenty-five annual collections of the kind brought together by Mr. John Hart. The Bishop, Dr. Forrest Browne, who will be remembered as a former Disney Professor of Archaeology at Cambridge, has lent several valuable exhibits, including a front of a chasuble (Italian) of about 1500; three pewter flagons used in mountain chapels in Switzerland and placed on charcoal braziers to prevent the wine and water from freezing; two copper gilt candlesticks; his pastoral staff, designed after an English example of about 1200, and a silver-gilt rosewater dish and ewer, presented to him on leaving Cambridge. The Dean and Chapter contribute a cope and mitre after an early 13th century design, and two unique silver candlesticks which, it is conjectured, belonged to a vessel in the Spanish fleet. The Lord Mayor and corporation have sent the Bristol insignia and plate. One of the swords is ascribed to the date 1373, and the donor of another was Sir John de Wells, Grocer and Mayor of London in 1431. During the Reform Riots in 1831 the rosewater basin was stolen by one James Ives and cut into 167 pieces. The theft was discovered by Mr. Williams, a silversmith of the city, who succeeded in fitting the pieces together, with the exception of two, which were lost, and Ives was transported for 14 years. The Duke of Beaufort sends four two-handled silver cups of 1698, and ancient dominoes found near Tintern Abbey. The Rev. E. J. Houghton, rector of St. Stephen's Bristol, lends a reliquary of St. Francis de Sales—a seal impression of Pius V., who excommunicated Queen Elizabeth, point lace of Charles I., and a gold and enamel locket of John Wesley. Church plate, silver crucifixes, embroidery, lace, and vestments of various periods are shown in great numbers.

An International Sanitary Conference was opened in Paris at the French Ministry of the Interior on Saturday by M. Delcassé, Foreign Minister, who alluded to the results obtained at the conference held in Venice in 1892, and added that experience had since shown the possibility of revising the rules then drawn up. That was the object of the present meeting. M. Barrère, French Ambassador to Italy, is presiding over the proceedings of the Conference, which will extend over several weeks. Its work has been divided into three heads:—(1) Revision of regulations enacted by preceding conferences and the introduction into them of such alterations as experience and the latest scientific discoveries have rendered possible in the interests of commerce and public health; (2) codification of all the regulations enacted by the preceding conferences and the present meeting; (3) measures for strengthening the control of health in Constantinople. The British delegates are Mr. De Bunsen, Dr. Theodore Thomson, of the Local Government Board, Mr. Frank Glenmore, and Mr. A. Alban, of Cairo. Dr. Ruffer represents Egypt.

The report of Mr. D. Joscelyne, late chief engineer and secretary, Public Works Department, to the Government of Bengal, the expert appointed by the Kent County Council to inquire as to the present system of main road management, is now in the hands of the members of that body. Mr. Joscelyne's investigations have extended over a year, and he sets forth the results

he has arrived at in a printed volume of upwards of 160 pages. His report is a trenchant criticism and condemnation of the present contract system. The method of preparing estimates is, he says, conducive to extravagance: the triennial system of contracts has failed: the practice of confining contracts for stone supply to one imported stone promotes monopolies and raises prices: the assurances of the county surveyor that the extended use of quartzite would be followed by diminished cost has proved illusory: the use of quartzite is absolutely condemned and a selection of basalts recommended: the supervision exercised is unequivocally pronounced to be defective; and much of the excessive wear and tear of the roads by traction-engine traffic is attributed to the system denounced. As to the working of the contract system, Mr. Joscelyne states that there are 28 districts, and in 1902-3, omitting 11 rural district councils, there were only 16 tenderers. A table of the accepted tenders for 12 years shows that the contracts have been shared during that period by eight firms, and, moreover, that by far the largest values go to the Road Maintenance Co. The published statistics are:—Road Maintenance Co. £179,788, Messrs. Tuff and Miskin £143,175, Messrs. J. Ellis and Co. £81,956, Messrs. Chittenden and Simmonds £78,878, Messrs. Arnold and Sons £77,088, Mr. Lambert £24,704, Messrs. Peill and Co. £19,836, Messrs. T. Wood and Sons £15,531. Mr. Joscelyne adds: "The contract system as applied to Kent means large profits for contractors at the expense of the ratepayers."

THE Strangers' Hall, at Norwich, a typical merchant's house of the end of the 15th century, situated between the churches of St. John Maddermarket and St. Gregory, which for fifty years had been allowed to fall into a sad state of dilapidation, and was finally threatened with demolition, was purchased in 1899 by Mr. Leonard Bolingbroke, by whom, after a year devoted to reparation, it was opened to the public, a small charge being made with the view of making the building self-supporting. The interest of the house, says a correspondent of the *Times*, has been greatly enhanced during the last three years by the collection within its walls of old household furniture and domestic appliances, so that it may illustrate, even in the most homely details, the life of the past. Beneath the west end of the hall is a fine crypt, of three bays, to the east of which are passages and other cellars. These cellars are probably the cellars of the house of Roger Herdegreve, burgess in Parliament in 1358, and bailiff of Norwich in 1360, which then stood upon this site. The kitchen and butteries, which are older than the rest of the building, may also have formed part of Herdegreve's house. The hall itself, with its groined entrance porch and oriel window, its kingpost roof and richly-moulded cornices and tiebeams, appears to have been built towards the close of the 15th century. The arrangement of the hall then was of the same nature as that of Haddon Hall, the screen crossing it at the eastern end, with a door in the south wall once leading into the garden, and two arched doorways in the east wall opening into the kitchen and butteries. A small portion of the original screen is still in position under the south end of the present gallery. The parlour, containing an open fireplace, is on the north side of the hall, and over it may have been a bed-chamber. Early in the 17th century the building was sold by the Sotherton family to Alderman Francis Cock, also a grocer, and in 1627 mayor of the city, who built out a room into the garden, and above it two other rooms, to give access to which he built in the hall a large oak bay window, and erected in it the existing Jacobean staircase and landing. At a later date this landing was extended across the end of the hall in a minstrel's gallery. The house afterwards came into the possession of Alderman Joseph Paine, who was appointed mayor in 1660, and knighted by Charles II. It was then that the doorway was made at the west end of the hall, leading, by a narrow staircase of oak with twisted balusters and carved brackets, to the west tenement, which was thus made an integral portion of the house. This western part of the building dates from Tudor times, and in Paine's day the lower front room was a Tudor apartment with a moulded oak ceiling. It is now panelled in the Georgian style, and the oak ceiling hidden from view by Georgian plaster, an alteration which may be attributed to the latter half of the 18th century, when the hall was in use as the Judge's lodgings.

Mr. WALTER RYE, F.S.A., has just published

a four-page sheet of some eight acts of vandalism which have recently been perpetrated in the city of Norwich. He illustrates his researches by a number of vigorous drawings, showing—1. The massive flint wall, probably 600 years old, fronting Bishopsgate-street, and inclosing the Lower Precinct. 2. The red-brick villas being erected in space that the wall shut in, all for £7 10s. per annum, and a hideous eyesore, says Mr. Rye. 3. A great piece of the interesting flint house in which the dean lives, recently cemented over by the dean. 4. A stretch of wall opposite St. Helen's Hospital, and used by the dean's tenant as an advertising station: and, comments Mr. Rye, "the dean of Norwich is a vice-president of the local archaeological society!" 5. A corrugated zinc fence, still abutting on the west front of the cathedral. 6. The cast-iron urinal on Tombland obscuring and defacing the grand Erpingham Gate. 7. The factory next St. Andrew's Church; and, finally, the hideous parti-coloured time-ball which breaks the line of the Norman Castle Keep.

THE West Riding County Council recently decided to divide the offices of county surveyor and architect, so long held by Mr. J. Vickers Edwards, and to appoint one official, who would be responsible solely for the inspection of highways and bridges, Mr. Vickers Edwards remaining the county architect. Mr. Fredk. George Carpenter, chief assistant in the surveyor's department, is to be the new surveyor of highways and bridges at a salary of £150 per annum, and Mr. Henry Moffatt Teasdale, one of the divisional highway surveyors, and Mr. J. U. R. Grave, assistant engineer in the highways and bridges department, will be appointed his assistants at salaries of £250 and £200 respectively. The new scheme will enable the county council to dispense with the services of the four divisional highway surveyors, whose salaries, including travelling expenses, amount to £1,000 per annum.

A REDISCOVERY, which cannot fail to have a wide interest for geologists, as well as architects and others interested in church building and church restoration, has recently been made in Weardale, county Durham. There are, says a correspondent, but few marbles in England suitable for the purpose of ecclesiastical edifices. In the southern districts Purbeck marble is the best known. In the North, Frosterley marble was in Medieval times the favourite, and extensive use was made of it at Durham Cathedral, for instance, in shafts, steps, &c. But for a considerable period Frosterley marble has been regarded as practically unobtainable. The energy and resources of the Pease family did, indeed, succeed in discovering a bed of it on their lands, and this has been turned to account in the Roman Catholic Cathedral at Norwich, and in various fonts and altar-tables. But then, again, the supply failed, and the marble was lost sight of except in very minor places. Quite recently, however, in working large limestone quarries, the Harehope Company were led by some indications in the bed of a mountain burn to make further explorations, with the result that a wide layer of the undoubted Frosterley marble was found bedded and buried in the limestone rock, quite 10ft. below the surface. The marble is black, rich in fossil corals, and very compact, and is said to be better calculated than Purbeck marble to bear great pressure and withstand atmospheric action. This arises from the fact that the fossils, imbedded in and forming part of the marble, are believed to owe their position and compactness to a salt-water formation, whereas in Purbeck marble the formation was due to the action of estuary or fresh water.

THE old Spread Eagle Hotel at Midhurst is being enlarged by adding to the hostelry two adjoining cottages. No alterations are being made to the main features of the buildings. The cottages are to be connected by a corridor with the hotel, the two rooms on the ground floor being used as dining and billiard rooms. Other alterations will be made in different parts of the house, and it is proposed to utilise the present billiard-room as a market or assembly room. In clearing out the cottages preparatory to fitting them for the reception of guests, some interesting discoveries have been made. In many of the beams, some 14in. square, which support the ceiling of the future billiard-room, there are numerous small holes in rows, and many were the guesses made as to the origin and uses of these till it was explained by Mr. Boxall, K.C., who visited the place recently, that they were relics of the time when the beams in question were used in

the old wooden walls of England. He said timbers marked in this way are a common feature of the wooded parts of the South of England, from whence many thousands of loads of timber were sent to the ship-building yards in days gone by. This practice made timber for building purposes scarce, and it was customary for the beams from old ships to be sent back to the district from which the shipwrights obtained their supplies; so it came about that numberless cottages contain a goodly proportion of ships' timbers amongst their woodwork. Behind a modern fireplace an old ingle nook with a seat on either side of the hearth has been discovered, and this will remain. In an attic were found over 200 panes of old-fashioned crown glass, each with the curious bottle feature in the centre, which can only be imitated but never equalled at the present day. This glass will be placed in the chief windows at the front and side of the dining and billiard rooms. The architect for the alterations is Mr. Falkingbridge Parker, of Coleman-street, E.C.

THE town councillors of Harrogate discussed on Monday the letting of the second contract for the new sewerage scheme. The sanitary committee recommended that the tender of Mr. Hampton Mathews (until last month a member of the council, but who resigned in consequence of tendering), amounting to £22,922, for No. 2 contract of the new sewerage scheme be accepted. A letter was read by Alderman Milner, stating that an item of £1,053 had been overlooked by Mr. Mathews in that tender. This would have brought Mr. Hampton Mathews's tender to £26,976. The next lowest tender was sent in by Mr. Richard Annakin, of Harrogate, amounting to £29,413. Alderman Fortune moved, as a matter of principle, that Mr. Mathews should not be allowed to amend his tender, as to do so would be most unjust to other contractors. Alderman Chippindale seconded. Dr. Solly moved an amendment that they permit that tender to be amended. It was a case in which the principle might be departed from. Mr. J. Houfe seconded, and thought they ought to consider the saving of £2,500 to the ratepayers. Alderman Simpson said he did not know a straighter man in Harrogate than Mr. Mathews, who, if he knew the feeling expressed, would not have the contract at any price. Dr. Solly withdrew his amendment, and Alderman Fortune's resolution was carried, and Mr. Richard Annakin's tender was accepted. Mr. Hampton Mathews's seat on the Bilton Ward was declared vacant, so that as a consequence of an error in casting up, Mr. Mathews has lost both his membership of the council and a substantial contract.

IN reply to the complaint by Messrs. Quayle and Ouvry, in a letter which appeared in our last issue, p. 477, as to the expensiveness of administration under the London Building Act, 1894, Mr. Henry Lovegrove, the hon. secretary to the District Surveyors' Association, writes: "The case described is very simple. There were not two surveyors. In the first instance the London County Council requested the district surveyor to report on the dangerous portico, for which he received from the Council the sum of £1 2s. 6d., and then, when the portico was rebuilt or repaired, the district surveyor became entitled to a fee of £1 16s. 3d., for seeing that the work had been properly carried out. The total fees of the surveyor amount to £2 18s. 9d., not a large amount for a man of experience, qualified by examination."

AT Hanley, on Monday, Oct. 12, a fire test of Uralite was carried out on ground adjoining the Grand Hotel (by kind permission of the manager) in the presence of a number of members of the North Staffordshire Institute of Mining and Mechanical Engineers, also borough surveyors, architects, and others. The test consisted of an ordinary partition, constructed of timber protected by Uralite slabs, against which a huge pile of wood soaked in petroleum was erected and set fire to. The temperature to which one side of this partition was subjected at times reached 1,850°, whilst the other side of the partition remained at atmospheric temperature. In the middle of this fire was also placed a deed box constructed of timber and Uralite. Inside this box paraffin wax, fusible metal, and sulphur, also a bundle of papers, were placed. The fire was afterwards extinguished, and the box opened, the contents examined and found unharmed, and the inside of the box was not even warm to the hand. The spectators expressed great satisfaction at the result, and predicted a great future for Uralite in

the Pottery district, where a fire-resisting building material is greatly needed for a variety of purposes.

MEETINGS FOR THE ENSUING WEEK.

FRIDAY (TO-DAY).—Southern Counties Master Builders' Federation Half-Yearly Meeting, at the King's Rooms, Royal Pavilion, Brighton. 12.30 p.m.

MONDAY.—Liverpool Architectural Society. "Venice," by Peter Cowell, city librarian.

WEDNESDAY.—Architectural Association. Discussion Section. "Siena," by T. W. Bramwell, A.R.I.B.A., 56, Great Marlborough-street, W.C. 7.30 p.m.

THURSDAY.—Society of Architects. Nineteenth Annual Meeting. St. James's Hall, Piccadilly, W. 8 p.m.

Sheffield Society of Architects and Surveyors. "Elementary Notes on Building Supervision," by C. F. Innocent, A.R.I.B.A.

FRIDAY.—Glasgow Architectural Craftsmen's Society. "Reinforced Concrete," by A. Horne Morton and G. H. Gibson. 8 p.m.

The statue of the late Bishop Creighton, by Mr. Hamo Thornycroft, which is to be placed in St. Paul's Cathedral, is approaching completion, and will shortly be cast in bronze, which metal, on the suggestion of the artist and with the sanction of the memorial committee, has been substituted for marble.

Leeds new School of Art was opened on the 8th inst. by Mr. E. W. Beckett, M.P. The new school, which is situated at the corner of Vernon-street and Cookridge-street, has been erected at a cost of £12,000, and a sum of £2,000 has been spent in equipment.

A new Wesleyan church and schools, which have been built in Ashley-lane, Moston, in connection with the Manchester Victoria Circuit, were opened on the 8th inst. They take the place of older buildings, which had become inadequate. The work has been carried out at a cost of £7,600, including the value of the site.

The Department of Commerce and Industries of the New Zealand Government has arranged to send an experimental contingent of 50,000ft. of New Zealand timber to the Government authorities in South Africa.

The foundation-stone of the Church of St. Andrew, Chase Side, New Southgate, was laid on Wednesday week. Only the western section of the church is being built for the present, which will accommodate 300, and will cost £3,450. The completed building will provide accommodation for 734 persons.

Mr. J. Waldo Smith, M.Am.Soc.C.E., has been appointed chief engineer of the Croton Aqueduct Commission, New York, at a salary of 12,000dol. a year.

The corporation of Blackburn have opened a new electric tramway line from Witton to Cherry Tree. The new line was formally inspected last week by Major Druitt, R.E., and passed. The total length of the corporation lines is now fifteen miles.

The new corporation covered wholesale market, Wulfruna-street, Wolverhampton, which was opened last week, is erected entirely of local bricks relieved with terracotta facings, and is roofed with red tiles. The work has been carried out by Messrs. Cave, from the plans of Mr. Green, borough surveyor. The cost amounted to about £16,800.

At a meeting of Penrhyn quarrymen, held on Saturday, it was resolved by 152 votes to 72 to continue the strike.

The Board of Trade have recently confirmed the following orders made by the Light Railway Commissioners:—(1) Lavingham and Rosedale Light Railway (Extension of Time) Order, 1903, amending the Lavingham and Rosedale Light Railway Order, 1900; (2) Dartford District Light Railway Order, 1903, authorising the construction of light railways in Kent, 22 miles in length, from the Thames near Greenhithe to Dartford, and from Stone to Eynsford, with branches to Swanley Junction and to Stanstead.

Mr. Bicknell, Local Government Board inspector, held an inquiry at Thornhill, Yorks, on Friday, on an application made by the urban district council for power to borrow money to enable them to contribute towards the erection of a bridge over the Calder at Osett, to defray the cost of widening Slaithwaite Canal Bridge, and to pay for the widening of part of Savile-road, Savile Town. There was no opposition.

A company has been formed in Pennsylvania for the manufacture of slag cement, and a factory will soon be in operation. The International Cement Company will work under patents of Dr. Otto Wirth, of Philadelphia, the process consisting principally in the removal of the sulphur. The first cement is to be made from the slag of the Jones and Laughlin Steel Company.

Trade News.

WAGES MOVEMENTS.

SCOTTISH UNITED OPERATIVE MASONS' ASSOCIATION.—A joint general meeting of the local branches of the United Operative Masons' Association of Scotland was held in the Oddfellows' Hall, Edinburgh, on Friday night, Mr. W. Scott in the chair. Addresses on organisation work were delivered by Mr. G. B. Craig, central corresponding secretary, Glasgow, and Mr. Fraser, organising delegate. An effort is at present being made to increase the membership, and it was reported that within the previous fortnight about 160 members had been added to the rolls of the Central, West End, and Leith Branches. It was stated that when the members of the trade were thoroughly organised, steps would be taken to have the agreement with the employers renewed. The opinion was expressed that strikes should be avoided, and that everything should be done to continue the existing good relations between the masters and the men.

The fine peal of twelve bells belonging to St. Mary Redcliff, Bristol, have just been rehung by Messrs. J. Taylor and Sons, of Loughborough, and were rededicated on Saturday.

Mr. Thomas Blockage, of Dewnap House, Dukinfield, died on Friday. Deceased was 76 years of age, and was the founder of the firm of Blockage and Sons, tile manufacturers, of Birch-lane, Dukinfield.

MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

LIST OF COMPETITIONS OPEN.

Bedlington—Corrugated Iron Fever Hospital	C. Browne, Surveyor, Bedlington	Oct. 17
Harrogate—Pump-Room and Colonnade in Valley Gardens	F. Bagshaw, Borough Engineer, Municipal Offices, Harrogate	26
Skewen—Public Library (limit £2,000)	Samuel Jones, Clerk, Old-road, Skewen, Neath	Nov. 9
Kilmarnock—Tenement of Shops and Workmen's Houses	Robert Blackwood, Burgh Surveyor, Market Bridge, Kilmarnock	9
Sunderland—Additions to Town Hall	John W. Moneur, A.M.I.C.E., Borough Engineer, Sunderland	21
Wakefield—Reconstructing Cattle Market	R. Ernest Langhorne, Solicitor, Wakefield	Dec. 1
Herne Hill, S.E.—Public Library	H. J. Smith, Clerk, Lambeth Town Hall, Kennington Green, S.E.	16
Vienna—Machinery to Lift Boats	The Austro-Hungarian Consulate-General, 22, Laurence-Pountney-lane, E.C.	(1904) Mar. 31
Glasgow—Branch Library for Parkhead District	Sir J. D. Marwick, Town Clerk, City Chambers, Glasgow	—
Liverpool—Cotton Exchange (Local Architects)	Peter Brown, Sec., 5, Brown's Buildings, Liverpool	—
Oldham—Board School	J. Rennie, Clerk, School Board Offices, Oldham	—
Llwynypia—Workmen's Hall (1,500 seats)	The Secretary, Workmen's Institute, Llwynypia, Wales	—

LIST OF TENDERS OPEN.

BUILDINGS.

Barrow-in-Furness—Store-Shed at Cambridge-street School	Education Committee	Oct. 17
Middleton—Rebuilding Two Chimney Shafts in Workhouse	Guardians	17
Peables—New Gasworks, Eschels	Town Council	17
Dunbar—Additions to West Bams School	School Board	17
Neyland—Additions to Baptist Chapel, Little Honeyborough	Thomas Leathes Exors	17
Embleton—Buildings at Low Netherlands	Education Committee	17
Barrow-in-Furness—Removal and Re-erection of Iron School	Cornforth United Social Club	17
West Cornforth—Additions to Premises	S. L. Jones	17
Resolven—Twenty Houses at Melincourt	Great Northern (Ireland) Ry. Co.	17
Dewsbury—Warehouse, Bradford and Wood-streets	Metropolitan Railway Co.	17
Hamilton-bawn—Stationmaster's House	Markets Committee	17
Neasden, N.W.—Repairing Shed	Great Northern (Ireland) Ry. Co.	17
Kinsale—Methodist Manse	Metropolitan Railway Co.	17

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2546.

FRIDAY, OCTOBER 23, 1903.

THE MODERN PRACTITIONER.

IN his double capacity of designing buildings and carrying them into execution, the architectural practitioner is often misunderstood. There are those who blame him for inattention to business matters, for ignorance of law, for excessive cost of building; there are others who make him equally responsible for any defect in the building, structural or artistic. He has to serve two masters—his client, who expects a good deal from him in matters of business, and his own artistic conscience, if he has any, or that more enlightened and appreciative public who are always ready to criticise. This dual capacity has not been taken into full account by those who are inclined to sum up the architect's qualifications according to an academical standard, or to some mode of practice that once existed. During the last week or two the requirements of the profession have been discussed, and it is beginning to dawn on those who would improve the status of the profession that the architect's position must be discussed in relation to his practical duties as well as to his art training. The Manchester School of Architecture, according to the address we gave last week of the President of the Manchester Society of Architects to the society, is amongst those who take this view. Practical work cannot be placed on the same basis as theory, which can be tested in the ordinary way by school training and examination; and it is this conclusion that has to be faced.

The professional practitioner is a very variable individual, a fact which is easily explained when we consider that we all approach the vocation of architecture through a more or less varied experience, and that our faculties vary much. There are those who have been brought up in the severe and rigid circumstances of a limited practice, who have only had the experience of assisting in the erection of the plainest buildings of the most ordinary kind, or of being brought up in the office of a building surveyor or builder in a country town; while others have breathed a very different atmosphere, have had the advantage of early training in the offices of large firms, whose practice has been varied and of a superior character, or have been in the offices of leading London architects. So that it is quite impossible to gauge a man's capabilities or to say how much in him is due to natural talent, and how much to early training. A great many of those whose earlier life and circumstances have been the most restricted, have by personal ability or dint of energy achieved a higher place in the profession than many who have enjoyed more favourable surroundings and a better education. We see many such cases; it is an everyday experience;—men who have been articled in the best offices are in a few years found in subordinate positions, often from no fault of their own, but that they have been less fortunate in the chances of life. Others less well placed succeed. Sometimes it is a rich patron who has come along at the right moment, and has given a helping hand, or it may be success in a big competition that has put the young man on his feet. Education does not count for much amid these changes and chances; various other forces must be considered—energy, good fortune, tact. If the most perfect system of architectural education were devised, and every young man entering the profession had to pass a qualifying examination before he could practise, we should find the same variation existing.

Each practitioner might have an equal start; but in a few years we should still see the inequalities and variations, the results of various conditions, mental and moral. It would be the same as placing each man on the same level financially at the start: in a few years we should see the same irregular line; some well off who had amassed wealth, others poor, indicating differences of physical, mental, and social advance. Some would be leading, others lagging far behind.

A qualification test for practice would, of course, relate to a knowledge of statutory law, like Building Acts, legal questions concerning the rights and liabilities of building owners, valuation of property, and various other matters affecting individuals and property, absolutely essential to the profession, though it would not test those personal faculties of tact and perseverance upon which success chiefly depends. It would prevent the unqualified and incompetent man setting up in practice; but it would do nothing to prevent the tactful and even unscrupulous practitioner from getting to the front and ousting better men than himself; so that an examination test will not guarantee the most desirable man in every instance. But it would do something towards promoting uniformity of practice. The knowledge of legal principles, of the rights and liabilities of building and adjoining owners, of the law of easements, would render it impossible for any professional man to take up a position that is indefensible, or to commit his client to a line of action that cannot be sustained. We should hear less of mistakes about the requirements of Building Acts, of the rights of owners in respect of light and air, of support which entail loss on clients. These are undoubted advantages of a professional test. Practitioners may broadly be divided into those who are men of business and those who are men of art. The former must be a man of action. He must not only think, but he must act. In receiving instructions to design and erect a building he ought to be able to put his ideas into a practical form, to draw out the wishes of his client, to enter into his requirements and tastes, be ready to meet any emergencies, and to anticipate objections, and the better prepared he is for this task the greater will be his success. Unfortunately, many of those who enter the profession have not this double gift. They give an opinion that is not supported by fact, or that may do in one set of circumstances but is quite inadequate in the particular case. This may not only apply to the design of a building, but also to the conduct of the work, in the supervision. For example, we are constantly hearing of plans being prepared for a special building which fail to pass the local municipal authority, the Local Government Board, or the Board of Education requirements, showing a want of preparation or knowledge of codes. In matters of superintendence a lack of caution or foresight often renders the architect or his client liable for some neglect as to support of the adjoining premises by shoring or extra foundations, for neglect to ascertain the right of acquired light to the premises of the dominant owner, or for some other infringement in building which ought to have been found out. Probably it is only experience that will enable an architect to act. He has learned to anticipate these difficulties and contingencies, and to prepare for them. Examination alone will not give him this intuition—no doubt a strong reason why the old system of pupilage is so valuable. Practical acquaintance with building operations is the only way in which the young architect can learn these matters. How many of the younger men in the profession in the first contracts they have to carry out discover one after the other these hindrances and opposition—matters about which they had not the faintest conception, such as the obstacles in getting their plans passed, local

regulations which require a considerable alteration of the plans, opposition of adjoining owners, the demands of litigious contractors for orders for extras, troublesome traders, &c. He finds his theories and assumed knowledge of his profession all leave him; they are of no use to him in these difficulties which crop up during the progress of the work. Circumstances arise which render his drawings or details useless; his specification requirements are disputed or called into question by the contractor, or his contract, on which he prided himself as being impregnable, is found out to be open to attack. What he has learned in books and classes about stone and timber or construction he finds of very little help when he is confronted with actual facts, materials, and building operatives, who look at them in a different way. There is nothing in common between the book theory, or terms used in the school, and those which the builder or tradesman uses. In short, he finds it necessary in the course of time to learn his business over again, and to adopt the practical phraseology of the workshop. On the whole, it must be confessed that the practical part of the architect's vocation—the business and active portion—is becoming more complex and intricate every day, and while a great deal can be learned in the architectural schools and the day classes of the Association, a great deal more will depend on the student himself, his natural aptitude and energy. The right direction of study is one of the main things that the schools ought to teach. A great many in the profession go about their work in the wrong way. Instead of taking a little trouble to understand their client's requirements, his trade or his habits, they distract his attention with designs of buildings they have executed, with suggestive schemes which have little reference to the actual wants. The client, if he does not know, selects a design which turns out a failure, or if he does know what he wants, feels disgusted, and abandons the whole. In other cases the practitioner plays into the hands of builders or other tradesmen who have an interest in the work, and compromises himself. Some consult their own pockets by increasing the expenses, adding to the ornament of the building, proposing designs for subsidiary things, like decoration, fittings, or ironwork of a costly kind, which increase the cost unnecessarily. In questions of law, contracts, dealings, with builders and committees, the necessity of dealing and acting rightly and promptly can only be acquired by knowledge of the point at issue. In matters of design the client may insist on a course which the architect knows is prejudicial; it is the duty of the professional man to advise, not to give in too complacently to the client's wishes. To yield in matters of plan may lead to serious mistakes and re-cremations afterwards. In questions of design the architect may easily forsake his duty under the idea of pleasing his client and bring reproach upon himself. Sometimes, as in the case of a shop, the business requirements of his employer may demand a large plate-glass window quite out of keeping with the upper part of the elevation, and the architect finds it hard to reconcile his artistic conscience with the suggestion. Yet he should not waver in his opinion, and he is justified in doing all he can to dissuade his client from a course that will not redound to his credit as an architect. But this is a matter which belongs more to the second part of our subject—the practitioner as a man of art. A decisive opinion on any point and promptness of action will save many a situation, where a *laissez faire* policy would be ruinous in business transactions. But decision of opinion implies a previous judgment based on facts—so hard to acquire by men of little experience. We have known men in the profession who are too ready to accept the dicta of their clients

in, say, questions relating to the value of property or compensations to be paid for damages, ancient-light cases, &c. Such men adopt the position of special pleaders, and stick to a certain opinion without independent investigation. They think it is their duty to side with one party against the other, whether right or wrong. Of course, it is a professional man's duty to discover the strong points of his client's position, and to defend them to the best of his ability. He must certainly fight for his client's interest; but this does not necessarily mean that he must stick up for a hopeless cause, or try to defend a wrong position. It should be his duty to point out to his client the right course to pursue, to discover the legal claims, if any, his client has, and not to hesitate to inform his client of the hopelessness of his case if need be. Such a course of action is, we are afraid, not generally pursued. If it is a compensation case for damage to property, the professional man is prone to think that his duty requires him to exaggerate the amount, to defend a valuation that is excessive, to adopt means, however indefensible, to secure success, such as calling professional witnesses of doubtful reputation; or, if he is engaged to prove obstruction of light, he is apt to go to great lengths in magnifying the obstruction, and to call witnesses to prove the substantial deprivation of light. In this desire to "go the whole hog"—to use a common phrase—the professional man loses the confidence of his client. An old adage says "Discretion is the better part of valour." Before acting it is necessary to be sure; no cause has been advanced by precipitate partisan action.

In the supervision of buildings the professional man's qualifications are fully tested. In no other position is the double capacity to know what is correct and proper and how to act with discretion and tact more desirable. A thorough knowledge of building construction must be accompanied by a sound, common-sense capacity, which it would be impossible to gauge by any examination test. As an example, we may imagine some alteration is necessary in a building. The drawings show one method, the circumstances of the case suggest another mode of construction. The architect must be able to devise a new system of construction; it may require the use of another material. Here the practitioner's skill as a constructor is put to a practical test: he has to bring into requisition his knowledge as well as his capabilities as a superintendent, which call for ready perception and tactical skill in dealing with the builder. Again, an alteration in a contract involves several business transactions between employer and contractor, in which a knowledge of contract law and the conditions of contract becomes necessary. The value of any such alterations has to be determined by measure and value, the amount of which has to be settled by the architect. These transactions cannot be easily made the subject of examination.

The other side of our question, the practitioner as a man of art, involves the question how far it is practicable to combine the business with the art side of the profession. We do not discuss that point now. There have been several notable instances of architects rising to a considerable position in the profession, who have been good men of business. To affirm that the two things are incompatible is simply to assert that a majority of the best architects are not qualified by nature to make good business men. Their training and their habits of thought are so unlike. Much may be done by the method of training and instruction the young man receives while serving his terms of articleship; but a great deal more is the result of the pupil's own aptitude and natural capacity in this direction. One pupil will direct his attention to transactions

between the master and the builder. He will take an interest in the letters which pass between the architect and client or contractor, the issue of certificates, reports, and valuations which it may be his duty to copy, while another student in the same office may be quite oblivious to these transactions in his eagerness to make drawings. The first of these will make a good business man; he is all-observant of what passes, and is ready to discuss any matter of business, while the latter turns a deaf ear to all that concerns external routine in his love for artistic work. The Manchester Society of Architects have, according to Mr. W. J. Beaumont, its president, declared in favour of the registration of the profession. As he truly said, "No form of registration would suffice to suppress 'quacks,' but it would enable the public to discriminate between qualified and unqualified architects." Both the business practitioner and the art architect would benefit by a little of each other's skill, and by the exclusion of men who, whatever their ability, have no qualification to practise in the true sense of the term.

REPORT OF THE FIRE PREVENTION CONGRESS.

THE Official Report of the International Fire Prevention Congress, instituted by the British Fire Prevention Committee, has been issued, and contains many valuable suggestions and resolutions to which we may now draw attention. The Congress held on July last discussed many useful problems, and several papers were read, of which our columns have contained reports. The publication before us is a rather bulky volume, and has been entrusted to the *Public Health Engineer*, the editor of which journal refers to the considerable difficulty entailed in reporting a congress at which three languages were in constant use. Mr. Edwin O. Sachs, the Chairman of the British Fire Prevention Committee, writes an introduction, in which he recapitulates several features of this congress;—the first that it was the first one of its kind; that fire protection comprises both fire prevention and fire fighting; and that although fire brigade tournaments have been held for the exchange of experiences, such as those at Amsterdam and Berlin, this was the first conference in which fire prevention measures have been considered as distinct from fire-extinguishing equipment. All the professions interested, including architects, engineers, surveyors, municipal officials, &c., have joined with professional fire brigade chiefs and officers in the discussion. Mr. Sachs also points out that among the most notable expressions of opinion by members is that which calls for the abolition of the term "fireproof" as applied to building construction. That the more correct term "fire-resisting" should be used instead has been acknowledged for many years by all who have written on the subject. We have invariably adopted the latter term as being more consistent with facts. The suggestion that a classification of degrees of "fire resistance" should be adopted is also desirable. The standards proposed by the British Fire Prevention Committee, to which we lately referred, seem to be good ones. They are (1) temporary protection, (2) partial protection, (3) full protection, in accordance with a schedule. All building materials and systems of construction to be classified under these heads. The first implies resistance against fire for at least three-quarters of an hour; that "partial" protection implies resistance against a fierce fire for at least one hour and a half, and that "full protection" implies resistance against a fierce fire for at least two hours and a half. These standards for fire-resisting floors and ceilings, partitions and single doors, are fixed in tables to which we shall refer. Another point to which attention is called is the desirability of revising the building laws in most countries to make them accord with the most recent experience.

We confine our attention mainly to that part of the report which deals with building construction and equipment—Section I. of the congress, presided over by many eminent foreign and English architects and engineers. The opening address of the chairman of the British Fire Prevention Committee (Mr. Edwin O. Sachs) contains a brief *résumé* of the scope of the

congress and the objects in view. These were, mainly to consider the practice of building construction and the application of materials from a fire prevention point of view, comprising the practice in different countries, and inquiring into the latest materials and systems of construction; to consider the equipment of buildings, particularly in relation to the application of electric power and lighting; to consider the development of automatic electrical fire alarm systems; to consider the legislative enactments in force in respect to the limitation of area or cubical contents of warehouse buildings and workshops, and the means of separating such buildings, the means of escape in case of fire, the construction and regulation of theatres and places of resort, and the means of escape in case of fire in shops and tenements, the best means of watching or inspecting buildings exposed to fire risks, &c. Many subjects are raised in this address, some of which we have already noticed. Thus the suggestion that municipal bodies should make building regulations retrospective, and that owners should have ample time to make the necessary improvements; that instruction in fire-prevention should be given in elementary schools in the form of tables and copy-book headings; that the regulations in force for theatres or factories may be extended to public schools—the sad experience of the Eton school is noticed in this connection. It is true, the housing accommodation of many large schools would not be tolerated in a common lodging-house. The increasing risks due to electrical plant, high-tension systems, arising from inexperienced plumbers and gasmen who have done the work, is another subject for legislative action. The insurance companies can exercise influence in preventing fire by encouraging better building. The value of what is known as "fire geography or topography"—the study of localities which have structural risks, and dangers arising from the contents of the buildings, is a very necessary step. All fire-brigade officers should be informed as to these localities. These are a few of the points that have been discussed. Several papers of interest follow, as that of Dr. Edward Atkinson, President of the Boston Manufacturers' Mutual Fire Insurance Co., which we reported, on the Prevention of Loss by Fire in the United States. He speaks of the old Colonial type of house as leaving nothing to be desired, and contrasts them with the crazy roofs and bad imitations of more recent European styles which have infested the States. These modern structures owe their risks to the cutting up of solid timbers into planks and joists, which have been put together in what is known as "basket" framing leading to a cellular type of structure of the most risky class. After discussion, a resolution was passed by the Congress to the effect that the Factory Mutual Insurance system, as adopted in the United States, materially tends to the prevention of fire and the reduction of fire waste, which was unanimously carried. Another paper on "Building Construction from a Fire Brigade Officer's Point of View," by Mr. Arthur Pordage, firemaster of Edinburgh, dwells on several matters which are a source of danger, though intended as safeguards. Amongst these are mentioned iron, concrete, and stone as being subject to the laws of expansion and contraction, and therefore not fireproof, though so termed in Acts of Parliament. Those which are not subject to these laws, and have withstood fire, are timber, bricks, mortar, and good plaster. The author describes various systems of construction which the ordinary fireman has found to withstand the effect of fire for a considerable time. These include ordinary wood joists with plaster ceiling, having thick floor boards tongued together, and the joists pugged between, brick partitions continued through the building, solid hardwood stairs instead of concrete or stone, the treads filled with "deafening," and plastered underneath. In the discussion, M. G. de Marie, of the Luxembourg Fire Brigades Federation, suggested as the best stairs those made of brick instead of wood. Mr. A. Darbyshire, F.S.A., agreed with Mr. Pordage as to stairs for domestic buildings, but for all public buildings—such as theatres, stores, mills, &c., he preferred concrete stairs in a newelled space. There is much in the discussion on this paper worth notice; but we have already given the gist. J. Stübgen, late city architect Cologne, contributes a paper on "Urban Fire Protection as Influenced by Street Planning and Building Regulations." The author refers to the Russian by-law which regulates the official plan of a city, and make

arrangements for the easy access to buildings by the fire brigade. A width of from 90ft. to 150ft. is provided for new estates, for the main thoroughfares, the blocks being divided by narrower minor streets in no case less than 10 metres—i.e., 32ft. 6in. The local building by-laws of German States take into consideration several points. (1) Access to a fire; (2) circulation at a fire; (3) prevention of an outbreak; (4) prevention of the spread of fire; (5) saving of life. These are severally discussed. With regard to the second point, the regulations provide for suitable approaches, areas, and staircases, an area must be planned in ratio to the area of building, also to its height. In Berlin the smallest area is 6 metres, in the suburbs 15 metres. The ratio of area of courtyard to total area of building site varies from 12½ per cent. for a corner building at Carlsruhe to 70 per cent. in the Berlin suburbs. Staircases have, it appears, a minimum width of 90 centimetres, or just under 3ft. In large tenement houses the top staircase is 1 metre (3ft. 3in.), and an additional 15 centimetres added for every floor downwards. Two staircases are required for an area exceeding 150 square metres, and so on, and no living room is to be further than 20 metres (65ft.) from any staircase. This is the rule in Cologne. A paper on "Modern Warehouses and Sheds in the Hansa City of Hamburg," by Chief Officer Westphalen, Hamburg, gives some useful remarks, with plans and sections of warehouses at Hamburg Dock, plans and views of Entrepôt Royal, Antwerp, showing the courtyards between blocks and the stairs and galleries, and details of roller shutters. The paper by Max Clarke, A.R.I.B.A., on "How to Make Existing London Buildings Fire-Resisting," we reported at the time. The author condemns matchboarding, naked floors with exposed wooden joists without any ceiling, studded partitions, lift inclosures and doors, fittings, lights, wells, and narrow streets—all defective and very risky arrangements. Mr. Clarke rightly objects to half-brick trimmer arches to carry hearths in wooden floors, the arches having the centring left in, and forming an open space under the brickwork lathed and plastered. The hearth should be of concrete the full depth of floor, with flat soffit for the plaster; he also advocates fireclay linings to all flues. The papers by Mr. B. Dicksee on "Fire Preventive Clauses in the Building Act" we lately discussed in its main provisions, and the valuable paper by Mr. Ellis Marsland, district surveyor, on "The Planning of Large Retail Commercial Establishments" we have also reported. These papers are given in extenso, and are well worth perusal. Section II. on "Electrical Safeguards and Fire Alarms," and Section III. on "Storage of Oils and Spontaneous Combustion" are interesting subjects, and many useful papers are printed. Section IV. contains papers on "Fire Survey and Fire Patents," Section V. "Fire Losses and Insurance," Section VI. on "Fire Tests and Standardisation"; but to notice any of the papers on these sections would go beyond our limits. The paper on "Safeguards Against Fire Caused by Lightning," by Alfred Hands, F.R.Met.S., shows several cases where towers and buildings have been struck, and where the conductors have failed to conduct the current. These are illustrated. The subject of "Electric Wiring" is dealt with by E. C. de Sagundo, A.M.Inst.C.E. "Fireproofed Wood as a Building Material," by Professor Woolson, Columbia University, in Section III., is also worth reading. The last section contains many instructive papers on "Fire Insurance and Fire Risks," and "Rules for Standard Fire-Resisting Construction," "Fire Insurance on American Principles." We have already referred to the paper on "Standards of Fire Resistance," by the Chairman; the tables give the suggested minimum requirements of resistance for materials or systems of construction, for (1) floors and ceilings, (2) partitions, and (3) single doors with or without frames. The resolutions which are the practical outcome of the conference are printed in a separate form, and we can only give here a brief résumé. We have already stated that the congress has condemned the use of the term "fireproof," and its indiscriminate application to building materials and systems in use; that the term "fire-resisting" is more applicable, and more correctly describes the varying qualities of the different materials and systems of construction intended to resist the effect of fire for shorter or longer periods at high or low temperatures; they also confirm the three standards of fire

resistance already mentioned according to the schedule. Another resolution considers that in all reports dealing with fire resistance the metric system of measurement, weight, and temperature should be adopted, as well as any local system. Other resolutions recommend the establishment of testing-stations for fire-resisting materials, and the adoption of a universally-recognised method of testing; also the formation of a permanent international technical bureau, which shall meet at certain periods to discuss, fix, and from time to time modify, universal methods of testing; the revision from time to time of local building regulations, so as to bring them into accord with results; that courses of study should be provided in universities, technical colleges, and schools for the instruction of engineers and architectural students in the fire resistance of building materials and methods of construction; that public authorities should encourage fire-brigade officers to take an interest in the preventive aspect of fire protection; that fire brigades should be placed on a sound legal basis, and their efficiency be supervised by a Government Department; that an official investigation should be made of all fires; that technical fire reports should be published for the public instruction. Other resolutions recommend the maintenance of private fire appliances, the necessity of distinguishing between safe and unsafe constructions in fire insurance rating, that the Factory Mutual Insurance System of the United States materially tends to the prevention of fire. Other resolutions recommend that for the safety of the public in attending theatres, easy means of exit from the auditorium by direct and clear routes, as distinct from circuitous routes, the provision of suitable fire watches and careful fire survey with a view to prevention of fire, the provision of automatic sprinklers over the stage; that these fire watches should be manned from the public fire service; uniformity of pattern, &c., of appliances; duplicate water supply service. An important resolution is that the congress "considers that every government should embody the primary equipments of fire prevention and protection in a Fire Act, leaving local regulations to be drafted by local authorities to meet local requirements, such regulations to be based on model by-laws." Another resolution was to the effect that the Technical Commission of the International Fire Brigades Council and the British Fire Prevention Committee, conjointly consider the possible publication in English, German, and French, of technical experience obtained at fires as an international publication. These are the main subjects. The report is largely taken up with the order of proceedings of congress, opening arrangements and speeches, the names of delegates, deputed by powers, home and foreign societies and boroughs, ordinary members' names, and discussions which have only an ephemeral interest. It however embraces a large fund of information and statistics on fire protection that will be of value to the profession.

THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting for the present session was held at 9, Conduit-street, W., on Friday evening, the President, Mr. H. T. Hars, F.R.I.B.A., in the chair. The President formally nominated Mr. Louis Ambler as Hon. Secretary, in succession to Mr. H. P. G. Maule, recently appointed as Master of the A.A. Day School. The motion was unanimously agreed to, and Mr. Ambler took his place beside the President amid hearty applause. To fill the vacancy on the committee occasioned by Mr. Ambler's promotion, Mr. G. B. Carvill was unanimously elected, also on the motion of the President. The following fifty-four gentlemen were elected members:—Messrs A. Hordern, C. H. Simpson, E. S. Charlton, H. C. Benson, J. F. Munnings, L. W. Edmonds, Leslie W. Green, J. A. Rogers, E. C. Burrows, B. Oliver, A. E. Hunt, L. S. Sullivan, P. K. Phipps, H. R. Smales, E. F. Duncannon, J. S. Turner, F. Nash, H. B. Newbold, R. I. Jones, C. S. Kimpton, F. H. D. Brockman, C. R. Davy, L. Kesteven, T. A. d'Arcy Braddell, P. G. White, J. M. Kellett, H. M. Gundry, C. E. Hanscomb, W. E. Woodin, F. J. Park, T. Braddock, C. R. Shield, J. B. Healing, E. S. Whitney, F. T. Bush, G. B. Griffith, S. H. Collins, J. B. Scriven, J. T. Sugden, L. T. W. Sinkins, C. A. Covernton, K. H. Milne, W. H. Ludlow, D. W. Clark, P. May, J. H. Chaudler, R. W. Pickering, G. D. Burgess, F. E. Mennie, W. Harvey, L. H. Read, and L. A. D. Shiner.

Mr. MAURICE B. ADAMS remarked that since they last met Mr. H. W. Brewer, the gifted artist, had passed away. Although Mr. Brewer had not been a member of the Association, nor indeed an architect by profession, yet they all appreciated his great skill and beautiful draughtsmanship, and he felt sure all would wish to join in passing a vote of condolence to his sons, one of whom was making his way in the pursuit of decorative art. Brewer's imaginative drawings, illustrating the ideal in architecture in the *Builder*, had always been to the speaker a source of interest and pleasure. The motion was seconded by Mr. FORSYTH, and having been supported by the PRESIDENT, was agreed to in silence.

The PRESIDENT said he had a very pleasant announcement to make—viz., that the Royal Institute of British Architects had promised a donation of £500 towards the New Premises Building Fund, a gift most acceptable from a pecuniary point of view, and also as showing the practical sympathy of the Institute with the Association. He proposed a hearty vote of thanks to the R.I.B.A. Council, and also to the following gentlemen for donations received since the last meeting:—Mr. Alexander Graham, £20; Mr. J. S. Gibson, £10 10s.; Mr. W. G. B. Lewis (second donation), £2 2s.; Mr. P. W. Lovell, £2 2s.; and Mr. J. H. Squire, (third donation), £2 2s. It was announced that Mr. F. W. Pomeroy's class of modelling would open on Nov. 5.

DAY SCHOOL TEACHING IN RELATION TO ARCHITECTURAL PUPILAGE.

Two papers on this subject were read, the first by Mr. ARTHUR T. BOLTON, the first Master of the A.A. Day School, and the second by Mr. H. P. G. MAULE, who has recently succeeded him in that appointment. The walls of the meeting-room were hung with a series of admirably clear and vigorous drawings made by students of the school.

In giving an account of his stewardship during the first two years' existence of the day school, Mr. BOLTON remarked that the idea of establishing such a school had for a number of years been contemplated by the Architectural Association, and the chief hindrance was the idea that such a school would destroy the long-established and well-tryed system of architectural pupillage. Fortunately, he continued, it has been proved that this particular danger had been exaggerated, and it has been found possible, thanks to the loyal concurrence of the profession, to work the school as a preparation, rather than as a substitute. The architectural profession has been fortunate in retaining the old traditional system of pupillage, during a period of changes and reforms, until the reaction has set in, so that it is now possible for us to develop rather than to destroy a method of training which, rightly understood and carried out, is still best adapted to a profession like our own.

THE PUPIL'S CHARTER: THE ARCHITECT'S SAFEGUARD FROM DUMPING.

It is generally agreed that a boy from school entering an office direct is seriously handicapped, and runs a great risk of losing the years of his articles owing to his inability to pick up work of so unfamiliar a character to his previous training. The day school is not only the pupil's charter, but is also an immense relief to the mind of the conscientious architect. The number of pupils sent to us at the Architectural Association day school by the profession is conclusive on this point. Now, what shall we say about the raw material as we receive it from the public school? If I had a confidential five minutes with one of our head masters I should ask what is this vicious circle in which you are revolving? Your case appears to be that the public schools are waiting for the universities, while the latter allege that they cannot move on your particular account. Is not this all very much beside the mark? What are the statistics of public school boys who go to the university? and what are the responsibilities of the schools to those whom they launch into life ill-prepared for their future work? For years the public schools have been drawing on their great asset, the right instinct that determines the parent to send his son to one of these great schools, for the sake of the development of that standard of character which will mean so much hereafter in his life. But, giving such considerations due value, are the schools right in supposing that they can for ever defy the competition of the best Continental training, and of new institutions growing up on similar lines?

In pre-Colenso days we might have had a reference to "my Army class." Now I am afraid we are coming to "my preliminary Royal Institute of British Architects' Examination Class." This last is a frightful outcome of our pet mania; we are classing ourselves with China as the two examining nations. It has occurred to some to wonder when it will be common knowledge that our primary schools work no longer under examination, but through inspection, to the immense relief of the teacher, and the great benefit of the scholar. It is apparently a crime like that of Oliver in asking for more to suggest that a certain architectural school might recruit itself by a similar method. The cause of public school deficiencies lies fairly deep. The remedy is known, but it is the will to apply it that is lacking. To justify such views it will be necessary to consider in brief outline

THE IDEAL OF EDUCATION

which we have in our minds, and to try and arrive at certain deductions from experience and observation which may guide us in a problem of such complexity as education. In the first place, let us start with the principle that education is not the acquisition of certain definite information, but the training of the mind to meet contingencies that can never be accurately foreseen. In the clear meaning of the term, it is the leading out or development of the powers of the mind, combined to some extent with a correcting and supplementing of native qualities. I am afraid this last limitation may not satisfy some enthusiastic teacher engaged in the most thankless of educational enterprises—that of instilling refinement in a mind of an incurably base type. May the teacher gain by the effort! What, now, is the ultimate object of education? The ideal of education is simply the development of mental power. The true educated man is not necessarily a product of university training, nor even, as a matter of course, a student of wide reading in books. This is a perpetual stumbling-block to many worthy people who confound the means with the end, and fail to realise by how many paths the goal of a well-developed and rightly-ordered mind may be reached. The accumulation of facts is of itself of no value whatever unless it is accompanied by a simultaneous development of the reasoning powers; nor is the study of grammatical niceties essential to a comprehension of a great literature or art. We must not, in fact, reverse the natural order of the acquisition of knowledge. Observe the process of a child's mental development. It is in essence a perfect specimen of the Socratic dialogue. The child's interest is first aroused, then comes the question, and following swiftly on the reply his more or less logical deduction, ending possibly in a perfect dilemma for the unfortunate parent. It is a mystery to me that so many teachers ignore this natural method. Students are drawn up blank against some concentrated essence, mainly grammatical, of a subject, and expected to develop an interest in the dry and often useless facts of which they utterly fail to grasp the bearing. The customary excuse is that of the importance of accuracy, which, however, is to be taught of itself, and probably can be far better inculcated through the verifications of experimental science than by literary and grammatical means. Let us now apply these principles to

ARCHITECTURAL EDUCATION.

In the first place, it will follow that neither Gothic nor Classic art of themselves are wholly necessary to salvation, and that the mere examination facts are not of themselves of any value whatever. What we shall need will be to give our beginner a good general survey of the historical development of architecture treated in relation to the character and conditions of the people and countries where it originated, utilising for this purpose the method of the contrast of opposites and its contrary of imitative resemblance. This survey should lead to the apprehension of certain central facts, the unity of all architectural expression in spite of its diversity, the possession of common qualities, and the permanence of artistic expression. When a student reaches the point that he can, as it were, make a summary division into two styles, the plain and the ornamental, has learnt that there is no monopoly in beauty, and realises that proportion, character, and fitness are all parts of one then he has begun to justify his education. He has entered upon a path presenting possibilities of progressive growth. A stumbling-

block for the young student is that presented in the right

RELATION OF ART TO NATURE,

more especially in architecture. When told "to study Nature" in the common phrase, the impression most probably produced on his mind is either one of mere bewilderment, or else a confusion of the imitation of concrete form with the outcome of deductions from an observation of natural facts, directed towards the apprehension of abstract qualities, capable of illustration in architecture. Take the commonest fancy of an amateur, that the nave of a Gothic cathedral is a copy of a grove of trees, and compare with this Darwin's suggestion that the awe which we feel on entering a grand building finds its origin in the effect produced on early man by the caverns and forests in Nature. The fallacy of the grove of trees strikes you at once as too gross for discussion, but the underlying idea is always cropping up in changing forms. Its plausibility depends on the fact of a certain coincidence of result in the works of man, reached through a long series of logical developments, with the seemingly irresponsible work of Nature. An instance given in Garbett's "Principles of Design" is the relation between the elephant's foot, the human hand when raised to uphold a weight, and the highly-developed Doric column. Similarly in Gothic architecture, in certain phases of its fullest expression, an analogy may be felt between the intricate clustering of relief and open work, and the tree tracery of the woods in winter. In Renaissance work quite recently an attempt was made to base a theory on forms coincident with Nature's spiral as seen in shells. The student once having found admittance to Nature's school is provided with a field of unending study. This observation and reflection on Nature is in many cases purely instinctive, and not seldom possessed without any capacity of expression, as it will be found welling up among dwellers in the country in unexpected forms. Much is said of the refinement of Turner's landscape, but to the artist himself, full of the sense of Nature obtained from life in the open, his work was doubtless but a coarse transcript of infinite subtleties. No student must rest content with a mere feeling after Nature's charm. Emotion must be translated into work, however imperfect, and the effort maintained through cloud as well as sunshine. Nature's process is infinitely slow, and artistic stature cannot be increased by taking thought any more than physical. The student's greatest enemy is his own self-conceit. There is always a place for the patient worker; but the flashy student incapable of independent and sustained effort will always remain a burden to his teacher. Every student is a problem in himself, and needs individual care, and the wisest teacher will be the least dogmatic in his judgment of capabilities, and the least ready to shut the door. In this hasty and imperfect sketch, fellow-students, I have tried to indicate to you

THE UNDERLYING SPIRIT

in which your education may be pursued. You came here, perhaps, expecting to hear about the details of the method employed in the day-school. We can all differ in that respect, and a student's own experiences will colour his personal prepossessions. I do not propose to justify the particular means employed—I might find myself launched into biographical particulars—but the foundation requires to be sure, and the basis must be a close touch with the actualities of our own day, and a solid continuity of effort on the part of the student not afraid of hard work. We are not entitled to set our students on a path which will make it harder than it need be for them to earn money within a reasonable period. The day school has been run on semi-office lines, with an effort after a thorough grounding in the drawing methods in common use. We may agree that skill in draughtsmanship is by no means the essential quality of an architect; but it is certainly a necessary qualification for an assistant requiring a place in an office, and we must look forward to the anxious period when, at the expiration of his articles, our day-school student has to give workaday proof of his powers. While giving prominence to draughtsmanship, I never could myself agree to its pursuit to the detriment of the study of design, nor could I could see the reason for postponing that important subject to quite a late stage in the student's career. In the second year course of the day school we have started the student in that important branch of his future work on very

conservative lines, utilising the interest of the student in creating something, to deepen his studies of the first year, and guiding him in his first essays by the sure aid of the past examples of his art. If you will look at the drawings in the second year, they will show you how interesting and practical the study of historical architecture may be made, and you will realise that for the preparation of these designs something more than a surface knowledge of the particular phases illustrated must have been acquired. I have a particular wish to secure your support for my successor in his important task of developing the equipment of the day school. The liberal assistance from the committee and the general body should be forthcoming in this matter. I am sure all the staff of the Architectural Association will hail with especial thankfulness

THE SOLUTION OF THE PREMISES PROBLEM,

which has lain across the path of the natural development of the Architectural Association for so many years. Hurry up and pay off this debt, so that the committee may devote themselves to the reorganising and equipment of the schools, which should do so much for the coming generation of architects. The day school has doubtless been a useful piece of underpinning; but there has always seemed to me to be

A TOP STORY WANTING

in our educational structure. A pretty good believer myself in Architectural Association methods, and fairly diligent in the classes, there came, all the same, a time when something more consecutive and thorough seemed to me to be essential. In my view it need not have been necessary to go outside the Architectural Association for such further study. Are our young students quite satisfied to-day, after, say, a year or two in the school of design? And if they are now, will those who pass up from the day school continue to find this school, admirable as it is within its limits, sufficient for the completion of their training? It is probably much better that the Architectural Association should finish its own students, affording them, on the slightest indication of the demand, the most advanced education that can be given. Whatever the future development may be, let us hope the Architectural Association will know how to preserve its old characteristic of mutual instruction, free from the isolating effect of systems of education that separate the teachers and the taught into separate classes. In the day school I have seen a smile on the faces of the class when I have touched on this point; but, for myself, I have learnt much from my two years' experiences, and I earnestly recommend some of our brilliant students to seriously consider whether they ought not to take their turn in our educational work. You all know of the zeal of the late Arthur Cates, whose loss the Architectural Association has so much reason to regret. In the last conversation I had with him this was one of the points he insisted upon, urging the value of the effort to teach others to the teacher himself. The Architectural Association ought to maintain a very large and able staff, as the numbers of students passing through the schools offers a very considerable field of selection. To those who dread captivity, we can reply that they are not asked to undergo a life sentence, and as to what they will get out of it, say all those things which are not learnt from books. Where it is an honour to serve, understaffing need never exist, and the strain of teaching can be immensely lightened by a liberal policy in this respect. Intercommunication and common action on the part of the teaching staff will naturally develop with reorganisation in our new home, to the great benefit of the students and the avoidance of overlapping. In labouring on behalf of our young students, architects can find a practical solution of many divergencies. Pardon me this parting word of advice: Retain your own opinions, but do not make them an excuse for holding back from the work.

In the paper which followed, Mr. MAULE observed that with the general outline of what Mr. Bolton had said he most cordially agreed, and he felt that the difficulty of his task in carrying on the work was light compared to Mr. Bolton's in starting it, and that in handing it over, every detail, every paper, was in perfect method and order.

TWO IMPORTANT FACTS.

With the Architectural Association scheme it is necessary, Mr. Maule proceeded to say, to bear two facts in mind—first, that the first year's

course consists in reality of only nine months' actual work in the school, as three months are allowed for independent out-of-door study, which forms an important part of the student's training. Secondly, that almost the most important part of the training is the second year, when the student is, in all probability, four days a week in an office and only two days a week in the school, during which time his study takes the form of directed exercises in design. This obviates the charge of mere academic teaching, as the student is brought into contact with the actual professional work of the day. Now,

THE PRIMARY OBJECT

of the day school is to enable the student to acquire, during the first year, such a knowledge of architectural drawing, of history, and of construction that when he goes into an office as pupil he can begin at once to take advantage of what he will there see and learn, and thus dispense with that awkward period, which most of us have experienced, of being plunged into an office with none but the vaguest idea of what to learn or how to learn it.

THE CONTINUATION OF EDUCATION.

There is another important feature, and that is that the organisation and method of the school training should enable a student to carry on his own education subsequently (supplemented, of course, by lectures and classes) with more directed method and application than is possible from an initial start in an office. Now, the amount of "in-school" time available in the first year's course—namely, actually only nine months—seems to me to make it imperative that the training during that period should be on the broadest and simplest lines possible; that the training should, in fact, be mainly directed to teaching the student a method of learning. To begin to learn to draw; to begin to learn to observe; to begin to learn to think; and, above all, to endeavour to naturally fire and regulate his enthusiasm, and lead him to love his work for its own sake. Without this latter as a resultant of the training, it is but labour lost so far as architectural training is concerned, though no doubt much useful knowledge would be gained which would always be an advantage in any work afterwards taken up.

THE ARCHITECT'S EVOLUTION.

The training, or rather the evolving, of an architect from the raw product of the public school is a long and complicated process, and when the shortness of the initial period, and amount of technical and constructive knowledge that is ultimately required, is taken into consideration, it seems self-evident that this early period should be made broad and general, and, above all, not too technical. It must not be forgotten that, no matter what brains a student may have, nor how highly trained he may be so far as general education goes, of the special subjects of an architect's calling, whether history, construction, or elementary design, he is in almost all cases entirely ignorant. His mind, therefore, no matter how receptive or retentive, cannot assimilate more than a certain amount of new matter, and it is assimilation and thought, and not an ill-digested assortment of facts, that really constitutes a good education.

DRAWING.

The construction subject as inaugurated by Mr. Bolton seems the best of all methods for insuring a simple and thorough grounding in elementary construction and materials, so long as the complete and direct relationship between materials, construction, and design is clearly kept before the student—a connection which there is every reason to believe is sadly neglected in much of the work which now passes for architectural education. I also attach great importance to the early, careful, and systematic drawing of simple full-size details in connection with the construction subject, for an abbreviation, such as a set of $\frac{1}{4}$ -scale drawings, cannot be properly understood—or drawn—unless the component parts, such as door and window openings, which they abbreviate, are clearly understood in detail. In all the work done in the school, great care should be taken to insure accuracy and clearness, and special attention should be directed to printing, and the value of clear and legible notes on working drawings and tracings.

OBSERVATION AND THOUGHT.

To an assembly of architects it is quite unnecessary to emphasise the importance of observa-

tion or the necessity for thought. The eye sees what it is trained to see, and the eye is the greatest of all educators; the mind also develops its thinking faculty by knowing what to think about. Unfortunately, the cultivation of observation does not apparently form part of an English school curriculum, and though most little children are very observant, the habit is generally crushed out of them long before they have arrived at an age when observation, and correct deduction from that observation, complement one another. To reawaken the lost habit, if, unfortunately, lost it is, should be one of the great aims of the training, and this awakening of observation, directed as it is, will surely bring with it the development of thought. Organised logical thought, the thought that will eventually enable a man to design with beauty and build with truth, because he sees clearly and without confusion, can only come with years; but the germ can surely be planted and tended during the first year in the school. Last, but not least,

ENTHUSIASM.

A famous writer once said that nothing was so catching as enthusiasm, and certainly no life work should be so capable of generating enthusiasm as the study and practice of architecture; but if the early years of training are overburdened with dry technicalities, or with work too far in advance of fairly easy comprehension, there is grave fear of the failure to awaken this divine spark, without which the whole structure of architectural education falls to the ground.

Mr. MAURICE B. ADAMS proposed a vote of thanks to the readers of the papers. This was seconded by Mr. A. M. WATSON, and supported by Messrs. MAX CLARKE and G. H. JENKINS, the latter urging that the course at the day school ought to be extended from two years to four, or even five years, as was usual in Germany. The motion was endorsed by the PRESIDENT, and carried unanimously, and acknowledged by Messrs. BOLTON and MAULE.

THE SOCIETY OF ARCHITECTS.

THE nineteenth annual report of the Council, for the session just ending, read and adopted at the meeting of the Society held last (Thursday) evening at St. James's Hall, Piccadilly, W., states that there has been a satisfactory increase in the membership, more than fifty applications having been approved, and thirty-three candidates have been elected, the remainder pending election. Fifteen members and two associates have resigned; one member has been transferred to hon. membership, four members have been removed from the roll, and three have died. Over twenty applications have been approved for the Students' Register, of whom thirteen have been elected this year, and there have been four resignations. Two competitions have been held during the past session, the subjects selected being "A Design for a Cottage Hospital," and "Measured Drawings of a Chancel or Side Chapel Screen," a prize of the value of three guineas being offered in each case.

The designs submitted in the first competition were carefully prepared, and were very close in order of merit. Mr. B. C. Ernest Bayley was placed first, and Mr. J. Nixon Scaife received hon. mention. There were no entries for the second competition.

The all-important question of Registration has received fresh impetus during the past year, and good progress has been made in preparing the way for further action. Early in the session the "Architects' Registration Bill Committee" was amalgamated with the Council of the Society of Architects, as a joint "registration committee," under the chairmanship of the President of the Society for the time being. Steps were then taken by means of a circular letter and reply postcard to ascertain the views of recognised members of the profession on the principle of Registration. It has been ascertained that some two-thirds of the profession has declared itself in sympathy with the movement for obtaining the statutory examination and registration of all persons entering the profession of architecture, and from the fact that less than 170 voted against the principle, and as every possible facility was given for voting one way or the other, it may reasonably be inferred that an overwhelming majority of the profession is in favour of legislation on the lines indicated. The society's circular received consideration by the Council of the R.I.B.A., which issued a counter-

statement, followed by a request to the allied societies to express their opinions on the matter. Several of the latter have since passed resolutions in favour of the movement, thus confirming the individual voting of their members, which shows that almost without exception the allied societies agree with the principle of registration. The persistent action of the society has naturally revived the antagonism of the few who, from the first, have strongly opposed any measure of the kind contemplated, and the usual paper controversy has resulted; but, on the other hand, many architects who hitherto have remained neutral, and some who formerly opposed, have thrown in their lot with the "Registrationists," and the support which the Society has received will enable it undoubtedly to attain its aim in due course. The Architects' Registration Bill, which is under the charge of Mr. L. A. Atherley-Jones, K.C., M.P., has been carefully revised by the joint committee, and again introduced into Parliament, and no effort will be wanting on the part of its supporters to secure its passage. The Council feels that many of the difficulties inseparable from the movement are being successfully overcome, and that steady progress is being made towards attaining the object in view. The Council has had before it the proposed London Building Act Amendment Bill brought in by the London County Council with the view of minimising the danger of fire; the Bill, however, was subsequently withdrawn, and the London County Council has since invited the Society to make suggestions as to any revisions to the Building Act generally. The matter is being dealt with by a sub-committee. The St. James's Hall property having been sold, it has become necessary to find other quarters, and the Council is in negotiation for premises in Holborn, which are well suited for the purpose. It is hoped shortly to make a more definite announcement. The Society was officially represented as follows at the several Congresses:—International Fire Prevention Congress, London, July.—Silvanus Trevail, J.P., F.R.I.B.A. (President), G. Gard Pye (Vice-President), W. Cooper and R. G. Bare. Sanitary Institute Congress, Bradford, July.—Walter W. Thomas (Vice-President) and S. Robinson. Royal Institute of Public Health, Liverpool, July.—Walter W. Thomas (Vice-President) and T. G. Williams.

On May 15, 1903, the members' Annual Dinner was held at the Prince's Restaurant, when the President, Mr. Silvanus Trevail, was supported by a representative gathering of over two hundred members and guests. On May 23 a very successful field day was held at Rochester, when some seventy members and their friends attended. Mr. G. Payne, F.S.A., acted as leader. On June 15 the Society paid an official visit to the Building Trades Exhibition at the Agricultural Hall, when some fifty members availed themselves of the opportunity. On September 30 the British Fire Prevention Committee made arrangements with the Directorate of the International Fire Exhibition, Earl's Court, for members to visit the Exhibition, when about seventy accepted the invitation. The Council has under consideration the drafting of a scale of charges and a form of contract for the exclusive use of the members, it having been represented that such would be of service. Many difficulties present themselves in formulating a scheme which will meet with general acceptance, and members can greatly assist the Council by suggestions. A large number of inquiries continue to be received for the half-yearly examinations, and the number of candidates is increasing. Examinations have been held during the session at London and also in Leeds. The syllabus has been further revised, and the regulations as to the admission of candidates made more stringent. In view of the recent introduction into Parliament of a Bill to amend the law relating to ancient lights, drafted by the Royal Institute of British Architects and the Surveyors' Institution, the question of further action by the Society in the way of legislation is in abeyance, pending the report of a committee upon the proposed Bill. The outgoings during the year have necessarily increased with the development of the Society's work, and there have not been such exceptional opportunities as occurred last year for augmenting the finances, more particularly in connection with sub-letting the hall; but it is expected that the auditor's report will show an increase in the ordinary income and a satisfactory surplus. In conclusion, the Council state that good progress continues to be made in every department. The

membership in particular has shown a more than usually satisfactory increase, there being a total membership of six hundred and fourteen, while there are indications of a further steady growth in membership and influence. The step which the Council took with regard to Registration has met with general approval and support, and the Society has a weight of opinion with it, in addition to its membership, which will greatly assist in the further prosecution of the movement.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE ordinary monthly meeting of this society was held on Thursday night in last week in the society's rooms, Leopold-street, Sheffield, Mr. E. Holmes occupying the chair. The President (Mr. Thomas Winder) gave his

INAUGURAL ADDRESS.

Mr. Winder mentioned that the Council of the Royal Institute of British Architects was again giving consideration to the question of Registration, and that of the Surveyors' Institution had adopted alterations to their rules which almost amounted to making surveying a closed profession. Sooner or later the question would have to be faced both by surveyors and architects in consequence of the action of members of another profession. No architect or surveyor of standing would dream of drawing up legal documents or of interfering with legal questions, and it was greatly to be regretted that members of the legal profession were abandoning professional traditions and encroaching seriously upon the duties of the surveyor, the valuer, and the land agent. Large numbers of plans were being drawn upon legal documents, often most incorrectly, by irresponsible junior clerks in solicitors' offices, and drawn with as little understanding of the meaning of the work as ability to make a correct plan. These plans were charged for, and this was unfair to clients, and would prove a fruitful source of litigation. Solicitors were also computing areas of plots, subdividing leaseholds, negotiating sales (including valuation), and, wherever possible, absorbing the duties and emoluments of surveyors and land agents. This was but another phase of the curious system by which one went to the draper for plumbing repairs, and to the chemist for stationery and literature, and it had been greatly stimulated by the publication of that most misleading publication, the 4 to 1 in. Ordnance Map. Perhaps the burning question of the day was the provision of so-called "artisans' dwellings." The question would very closely affect their professions were it not for the opinion that the introduction of professionalism into the question was undesirable. The city council recently had an opportunity of getting the benefit of the experience and ability of the whole of the Sheffield architects, but was most careful so to frame its conditions as to prevent the majority of the members from competition. Their members could, and would, have given invaluable assistance in the solution of that most difficult problem—the provision of a sanitary and convenient cottage, at the minimum cost, with the maximum accommodation, which would comply with the Corporation by-laws (this was a *sine qua non* unless the city council was building), and should also conform to the fads of the Local Government Board, one of which was that the smell of cooking should be confined to the kitchens. He had elsewhere expressed the opinion that the authorities were making a cruel and gigantic blunder in the way they were approaching this most difficult social problem. They condemned a large area of property and destroyed numbers of houses long before others were erected to take their place. This could only result in the poor creatures turned out herding in already overcrowded houses, with results such as he came across recently, where seven families were packed into one house, whilst the local authorities—not of Sheffield—were squabbling with the Local Government Board because the latter considered the workmen's dwellings were too large for people one-third of whose earnings would be absorbed by the rent of the corporation-provided houses, even should they be fortunate enough to secure them. What were wanted, and what the architects of Sheffield should be encouraged to design, were small, well-built, inexpensive houses of from one to five rooms, which unskilled workmen, widows, and others who earn a bare living wage could afford to rent. No one would grudge the erection of such houses,

even if they were let at a loss, but to erect villa residences which ratepayers had to subsidise was unfair to ratepayers, to contractors, and to property owners, and to all but the fortunate, and generally far from needy, few who got possession of them. His idea was that if corporations could be induced to adopt the system in vogue amongst railway and water works contractors and erect iron houses upon sites which at the present time were suitable, they might in twenty or thirty years remove them and erect others on sites which would then be more suitable, making a handsome profit out of the improved value of the old sites. The piling up of by-laws and Acts of Parliament for municipal or urban aggrandisement was a very grave menace to the city's future wellbeing. The fact that a person who inadvertently or otherwise broke a by-law was allowed in some cases to continue to do so on payment of an annual fine was proof that such by-law was unnecessary. This was further proved by the fact that corporations repeatedly ignored their own by-laws. The council of the society had given much time to the consideration of the education question, and had reason to hope architectural education would enter into the curriculum of the new Sheffield University. The recent visit of the British Archaeological Association to Sheffield had drawn attention to the rapidity with which ancient buildings were disappearing, and had shown how poor were the records which had been kept of them. Could not the Architects' Society do something to preserve them from utter oblivion, enrich their library and increase its usefulness by adding to it photographs and measured drawings of the few remains which were worth recording. The committee of the High Hazels Museum would accept with gratitude any ancient object of local interest, and they might assist in making a valuable collection of old lead hoppers, mantels, plaster-work, and especially examples of early cast-iron work.

EVOLUTION OF THE FARM BUILDING.

The President also gave an interesting lecture, illustrated by lantern slides, on "Farm Buildings." He opened with a plea for the use of local materials, and gave a rapid sketch of the evolution of the English homestead, which he believed was a development of the Saxon one, in which the master, men, maids, and stock all dwelt under one roof. This was followed by remarks on the position of the homestead upon the holding, upon drainage and the water supply, in which he warned his hearers against the danger of infection to wells, &c., by the percolation of water through worm or mole-holes, or through holes made by the roots of trees and vegetables. He said that it is usual for the farmer to bear the cost of the team work for new buildings—which is probably a survival of the old boon-team service—a feudal service which was not altogether obsolete when he entered the service of the Duke of Norfolk, 30 years since. The best arrangement of the various buildings with their respective positions on the homestead was then considered, together with the most suitable materials for their construction. The lecturer drew the attention of his audience to the anomaly of the use of the same by-laws as to air space and ventilation for cow-houses situate in the slums of a city and for those on the bleak Derbyshire and Yorkshire hills. He said the pigeon cote was not now obtaining the attention it deserved, and that where a large cote was found upon a 17th-century homestead, that homestead would probably prove to have been the manor house, and gave as examples of this Kimberworth, The Grange, Hesley Hall, Hands-worth, &c. He wound up his lecture with a description of fox-earths constructed by him in the Treeton Woods for the protection of vixens and their cubs.

On the motion of Mr. Gibbs, seconded by Mr. J. Smith, and supported by Messrs. E. Holmes, H. L. Paterson, and others, a hearty vote of thanks was accorded to the President for his address and lecture.

THE NEW GAIETY.

THE private view of the New Gaiety Theatre at the corner of the Strand and the western arm of Aldwych, and which is to be opened next week, took place on Tuesday. The London County Council in acquiring the old Gaiety premises granted the proprietors a lease at the

rent paid for the old theatre, for fifty years, of the adjoining area now built upon.

The new site allotted consists of 12,800 square feet, as against about 11,200 square feet upon which the old theatre stood, and has a frontage of about 27ft. 6in. to the Strand, a corner frontage of 40ft. and a frontage of 138ft. 6in. to Aldwych, both of these thoroughfares at this point being 100ft. in width.

In settling the question of reinstatement with the Council, a sum of money was agreed upon (£50,000) as the "minimum" to be expended in covering the site, and a sum beyond this by way of compensation for disturbance. Designs were prepared and were part of the agreement as a "type" contemplated by the parties in entering into a contract; but a special provision was made whereby the Council, should they desire a building of a more ornate or costly character and design, should pay the difference between the cost of such more ornate design and the "type" design. The perspective of the original or "type" design, which was on the line in the Academy in 1901, was intended to be carried out in red brick and Portland stone. It was then found that the theatre could not, with advantage, be carried up to the full height of 80ft. as permitted by the Building Act, as this great height was unnecessary, and the adjoining New Gaiety Restaurant and Hotel (also being reinstated) would, for obvious reasons, take advantage of such maximum height. The Council were of opinion that the differences in the heights of the two structures was not desirable, and were further of opinion that the material for the exterior should be of a more costly character, and the design more elaborate and ornate, and the architects were instructed to send in an amended design. This was done, but prior to this eight suggestions by as many architects had been submitted to the Council at its invitation for the general treatment of the elevation upon the Strand Improvement, leading to a deadlock, which was ultimately solved by Mr. R. Norman Shaw, R.A., being approached by the architects, with the consent of the Council. Mr. Norman Shaw prepared sketch designs for the exterior which were acceptable to the Council, and from which the architects prepared the working drawings of the exterior as now executed. Mr. Runtz's original design was illustrated by two large perspectives in our issues of Aug. 23 and 30, 1901, and the revised design, as now carried out with certain modifications by a double-page perspective and two plans in the BUILDING NEWS for September 26, 1902.

The disposition of the site, with its two frontages diverging from the important circular corner, has naturally influenced the internal planning of the building. The position for the chief entrance was necessarily at the junction of the improved Strand and the new Aldwych, and gave the cue to the general internal arrangement, suggesting a symmetry of plan as regards exits and entrances about an axis passing through the main entrance. This, together with the circular treatment of the crush-room and foyer at the angle, became the guiding principles in the planning of this theatre. Entered under the dome, which is about to be erected at the corner, is a circular columniated crush-room, with retiring rooms and box office, from which staircases lead right and left up to the grand circle back. This again leads one right and one left for the full width of the tier, with three entrances thereto and down both sides of it, with additional entrances at the bottom, and midway between them on either side an extra exit on to the street, which obviates the necessity of passing through the crush-room in the event of a panic. This arrangement obtains practically in all parts of the house. Below the crush-room is the stalls saloon, and above it are the saloons to the grand circle, balcony, and gallery, all following the lines of the crush-room and circular or oval in plan. A special feature has been made of private retiring-rooms or lounges to the private boxes of the stalls and grand circle tiers; those to the latter on the O.P. side become the Royal retiring rooms, with a separate entrance from Aldwych, and with private and separate accommodation. The ranges of boxes and the adjoining retiring rooms can be respectively thrown into one at will. The entrances and exits to the parts other than the stalls and grand circle are alternately in the Strand and Aldwych. On the north side is provided a convenient and commodious suite of offices for the use of the management. The open colon-

nade or loggia on the upper floor of the main façades is approached by two staircases from the gallery level. The theatre is a "three-tier house," and the seating accommodation is approximately as follows: Gallery 400, upper circle 260, dress circle 172, stalls 146, pit 300, private boxes 48; total 1,326. The principal dimensions are as follows: Auditorium, 60 ft. by 64 ft. deep; proscenium, 30 ft. wide by 36 ft. 6 in. high.

Behind the proscenium is a stage, 40 ft. deep, and of an average width of 80 ft., with a mezzanine floor and cellar below. Right and left to the Strand and Aldwych are the stairs leading to the stage exit and entrance, and the dressing-rooms, numbering twenty-nine in all. The flies are provided with a separate gallery for the convenience of the electrician managing the special lighting effects and lines. The gridiron is of more than usual working capacity; it is 70 ft. above the stage.

The simple proportions of the Italian Renaissance of the Florentine School have supplied the motif of the external treatment, relief for the large wall spaces being sought in the large circular-headed windows and niches with their pilasters and pediments. The massiveness of the treatment is crowned by the open order of coupled Ionic columns, entablature and balustrade. But the most striking feature will be the large dome, 40 ft. in diameter and 90 ft. above pavement level, now about to be begun, supported by seven pairs of consoles, and surmounted by a winged female figure 17 ft. in height. It is anticipated the dome and surmounting figure will be complete by the end of November. The whole of the façades are executed in Portland stone, with bands of Verde Antique marble. The internal dome will be constructed of steel and concrete. The external dome will be built up in steel and wood, and covered with copper. The crowning figure is being executed by Mr. Hibbert Binney. A new feature, not shown on our perspective published in September, 1902, is a covered shelter of iron and glass, forming the approach to the main entrance at the angle of Aldwych and the Strand.

The whole of the construction is as fireproof as is practically possible, and generally consists of cement, grey stone and blue lias lime, brickwork and steel, and concrete floors and roof. The floors are almost exclusively finished in cement, and the roofs of auditorium with a double layer of asphalt. The steps throughout are granolithic. Scagliola is employed in the columns of the crush-room and foyer, with modelled caps and bases in plaster. The constructional steelwork of the tiers, roofs, and dome has been executed by Messrs. Dennett and Ingle, engineers. The circles are constructed in steel and concrete throughout, and so designed as to carry from wall to wall of the auditorium without intermediate supports. The main girders of the circle vary from 3 ft. to 4 ft. in depth, and support lighter shaped girders, through which cantilevers project 12 ft. to 15 ft. to the front of the circles. The cantilevers are built up with steel plates and angles, and the larger ones have a depth of 2 ft. at the fulcrum. The total weight of the three circles when fully loaded is estimated at about 350 tons, and this weight is transmitted to the foundations partly by the brick walls and partly by cast-iron and steel stanchions imbedded in the brickwork. The stepped surface of circles is formed in concrete upon steel bearers spaced from 2 ft. to 3 ft. apart, and the ceilings are constructed with metal lathing suspended below the girders and cantilevers, and at such a level as to permit of an unbroken soffit and a clear height of not less than 8 ft. from circle to ceiling. The large dome is placed partly over the auditorium, and is carried upon steel girders at the roof level. The two main girders support loads of 200 tons and 120 tons respectively. The ends of the larger of the two girders come over openings in the auditorium walls, and are supported by twin riveted girders, and the weight is eventually transmitted to the foundations by means of cast-iron stanchions built in the walls. The total weight of the tower portion of the building at its base is estimated to be about 1,700 tons, inclusive of the loads supported upon girders and stanchions.

To cope with an outbreak of fire a complete system of high-pressure fire mains and hydrants is installed. In addition to this the proscenium is fitted with double thickness asbestos fire-resisting curtain, with patent slip gear at the stage level and at the stage door, as demanded by the London County Council, as well as the usual

raising and lowering gear and counterbalance weights. Provision is also made for cooling the curtain by means of a specially-designed sprinkler. The sanitary appliances have been supplied by Messrs. Doulton and Co., Ltd. The method of ventilation is by the propulsion system, and the ventilating and heating arrangements by Messrs. James Stott and Co., Ltd., are in combination. In designing the electric-light installation, every precaution has been taken to minimise the risk of a total extinction through the failure of supply. The two-circuit system has been installed throughout the theatre, in the auditorium, passages, entrances, and exits, the lamps being installed alternately on two circuits, connected to two absolutely independent sources of supply. As a further means of protection, a number of "police lights" are being installed, and connected to a third independent system of supply.

As to decorative treatment, the auditorium is flanked with twelve private boxes, with arched loggia over, forming also a constructional feature in carrying the novel vaulted ceiling with its squinch arch treatment, trumpet-like in general formation for acoustic purposes, and embellished with winged figures and modelling by Mr. W. J. Neatby, and three decorative tympanum panels in oils by Mr. Charles Buchel, representing Aladdin journeying with his retinue from his old to his new palace. Upon either side of this arched opening and in the spandrels are two niches containing figure-subjects of Music and Dancing by Mr. Hibbert Binney. The boxes are divided with pilasters and columns, in front of which are conventional figures bearing electric-light garlands. The ceiling over the auditorium is fan-shaped, with the divisions embellished with shells, masks, and swags. The circle fronts are of modelled plaster, principally by Mr. Sidney Webb. The mural decorations consist of a material by Rottmans, having a groundwork of old rose, with a raised art nouveau designed in gold, cerulean blue, Hooker's green, and permanent red being sparingly introduced. The decorative plasterwork throughout is by Messrs. George Jackson and Sons, of Rathbone-place, W. The crush-room is in the Georgian style, with marble columns, bronze caps and bases, supporting a modelled entablature and frieze; the floor is of marble mosaic. The foyer is treated in hardwood, the panels being occupied by full-length portraits of five Gaiety favourites: Nelly Farren, Kate Vaughan, Letty Lind, Sylvia Grey, and Ellaline Terriss. The frieze above is richly gilded, and the modelled ceiling entirely in ivory white. The gallery saloon is decorated in prevailing tints of white. The whole of the decorations of the building have been carried out by Mr. Edward Bell, in accordance with the specification of the architects. All the doors throughout the building are fitted with the well-known and convenient Yale locks. The architects are Messrs. Ernest Runtz and George McLean Ford, and in addition to the general structure, the whole of the decorative work and upholstery is from their designs. The contractor is Mr. Henry Lovatt, of London and Wolverhampton. Mr. Lovatt's foreman on the job is Mr. Bassett. The clerk of works is Mr. D. Davies, who occupied a similar position at the Adelphi, Apollo, and Wyndham's Theatres.

IRONMONGERY AND ELECTRIC APPLIANCES.

THE well-known firm of tool, machine, and hardware merchant, Messrs. R. Melhuish, Sons, and Co., 84, 85, and 87, Fetter-lane, Holborn-circus, have just issued a revised and extended edition of the ironmongery section of their catalogue, in which attention is drawn to the quality of the goods and the exceptional terms at which they are offered. The scale of prices very favourably compares with any wholesale house in the country. We can only glance at the well-illustrated pages of this catalogue, in which the architect and builder will find every variety of ironmongery and electrical supplies they may require. The suites of polished brass door furniture for outside and inside use are of good design, and suitable to every style of building. Each article has its price affixed. Several very tasteful designs are shown for finger-plates, Pitt's mortise furniture, door-knockers and handles, letter-plates. The door handles are in great variety of shape. Pages follow illustrative of brass and iron French window bolts, door chains, night bolts, Norfolk latches, sash lifts, lever handles, and other appliances for

doors. We draw attention to some excellent brass casement fasteners and stays on pp. 26, 27; also brass butt hinges and hooks for various purposes. The brass sash fasteners and door-springs are very complete. Rim, mortise, and other locks illustrate every improved make, from the 6 in. japanned steel-case two-bolt lock to 6 in. "Scotch spring palace-motion two-brass bolt" mortise locks and Yale mortise front-door locks. Shop-door latches is another speciality. Stable fittings, including stall and loose-box divisions, harness brackets, &c., cast-iron manger sets, gutters; ventilators, including Boyle's "air-pump" appliances, &c., form a section; another section is devoted to all the latest cookers, gas grills, radiating stoves, heating stoves, kitcheners, and grates of every approved type; mantel registers—some of these are original in design. The electric appliances, bells, switches, pushes, bell fittings, &c., are comprehensive, and include every requirement. The diagrams illustrating connections for bell indicator circuit, p. 270, &c., will be found useful; direct-working telephones, with diagrams of connections, will be found of much use in specifying and fitting, and the electric-light fittings comprise many elegant designs for ceiling fittings, drop lights, and pendants and brackets. Other sections of the catalogue are devoted to rain-water goods, gas-fittings, and sundry other details of general ironmongery. The catalogue is well printed and profusely illustrated, and every article is priced.

THE R.I.B.A. STANDARD SIZE OF BRICKS.

THE following standard has been agreed upon between the Institute and the Brick Makers' Association, and has been drafted in consultation with these bodies and representatives of the Institution of Civil Engineers, and ordered to come into force on May 1, 1904.

The council recommend that members should insert this standard in their specifications under the title of "The R.I.B.A. Standard Size of Bricks."

1. The length of the brick should be double the width, plus the thickness of one vertical joint.
2. Brickwork should measure four courses of bricks and four joints to a foot.

Joints should be $\frac{1}{4}$ in. thick and an extra $\frac{1}{8}$ in. making $\frac{5}{8}$ in. for the bed joints to cover irregularities in the bricks. This gives a standard length of $9\frac{1}{4}$ in. centre to centre of joints.

The bricks, laid dry, to be measured in the following manner:—

- A. Eight stretchers laid square end and splay end in contact in a straight line to measure 72 in.
- B. Eight headers laid side to side, frog upwards, in a straight line to measure 35 in.
- C. Eight bricks, the first brick frog downwards and then alternately frog to frog and back to back, to measure $21\frac{1}{2}$ in.

A margin of one inch less will be allowed as to A, and a half-inch less as to B and C.

This is to apply to all classes of walling-bricks, both machine and hand-made.

EXPERIMENTS ON THE FLOW OF WATER IN PIPES.

IN a paper recently read before the American Society of Civil Engineers, by Augustus V. Saph, Assoc. Am. Soc. C.E., and Ernest W. Schoder, jun., Am. Soc. C.E., the authors show that experiments confirm the law of variation of resistance proportionate to the power 1.75 of the mean velocity. These were for brass pipes of small diameter. The authors find for galvanised pipes a variation proportional to the power 1.90 (about) of the velocity, indicating that the exponent of V varies with the interior surface of pipe. Mr. Flamant, in the discussion, pointed out that it would be interesting to make experiments with pipes of different materials such as glass, earthenware, wood, wrought iron, to ascertain the effect of the surface, or of an interior coating of paint or tar. The experiments made by the authors of the paper also showed the effect of temperature on small pipes. The confirmation of the increase of flow with the temperature for small pipes is of value. Mr. Mills, another authority, observes, "The effect of temperature upon the flow of water in pipes is a valuable addition to our knowledge. . . The most interesting series of experiments, because it gives the slopes for both high and low temperatures through the greatest range of

velocities, is that upon the smallest brass pipe which is about one-tenth of an inch in diameter. With temperatures of water near 70° Fahr., the slope varies nearly with the first power of the velocity, being contained between $S = 0.129 V$ and $S = 0.138 V$ for all velocities given up to $V = 2.309$ ft. per second. Above this velocity the slope increases much more rapidly. Upon reaching a velocity of 3.3 ft. per second, the slopes come into line with those of higher velocities, which vary with a power of the velocity somewhat less than the second power, being with the very smooth pipe near the 1.75 power . . . with small velocities and the water having the lower temperature has the greater slope, but during the rapid increase that follows, the warm water being less viscous and more mobile, makes this change at smaller velocities than the colder water, and the slope for 75° is greater than the slope for 70°, and both become greater than that for 38.5°. These experiments are useful as showing that the "principal effect of temperature is upon that resistance of motion due to cohesion and adhesion which varies with the first power of this velocity." Many other writers discourse on the subject, which has a practical interest for hydraulicians, though it must be admitted that few large pipes have such smooth surfaces as the small brass ones used in the experiments. It is therefore reasonable to make an allowance for this difference. The experiments also show the uselessness of relying on one formula as applicable to all the conditions found to exist in practice. We refer those interested in the discussion to the report on the *Proceedings of the American Society of Civil Engineers* for September.

THE HALLS OF TARA.

THE Commissioners of Public Works in Ireland refer in their annual report to the excavations at Tara. These excavations, they remark, now happily suspended, or come to an end, have been the source of much anxiety to the public, as may be inferred from the number of questions on the subject put in the House of Commons for some time past. The earthworks at Tara, constituting the only remains of the Royal residence once occupying the hill, are among the structures scheduled to the Ancient Monuments Protection Act 1882. The legal effect of scheduling is to give the Board of Works certain very limited powers for preservation. When a monument is scheduled the Board have power to prosecute, for injury or disfigurement of the ruin, all persons other than the owner, or anyone acting on his behalf and with his authority. As against the owner and any person acting by his direction, "scheduling" gives the Board no remedy, and provides no means for protection of the monument against injury. The Act enables the owner to vest the custody of the monument in the Board, and where this step is taken we are clothed with powers against the owner and his clients similar to those which the mere "scheduling" gives against other persons. The question of vesting the custody of the Tara mounds has been the subject of correspondence, but the owners have not seen their way to vest, and our powers are consequently confined to those which result from the "scheduling" of the monument. In June, 1899, excavations were commenced on a portion of the hill within the scheduled area. The excavations were undertaken by some parties with the consent and authorisation of the owner of the portion referred to, for the purpose of looking for the Ark of the Covenant. No opposition to the work was made by the then occupying tenant. On ascertainment of all the circumstances, we recognised that we were powerless to interfere by legal process, and necessarily confined our action to an endeavour, which was unsuccessful, to secure by persuasions the cessation of the excavations. The excavations continued during the summer, and were renewed in the spring of 1901 to a limited extent. In December of that year the tenancy of the farm on which the excavations had been made was sold, and, in consequence of representations made to the purchaser by our inspector of national and ancient monuments and others, he interposed to prevent further defacement. Some small excavation was commenced in the spring of 1902, but stopped at the instance of the tenant. The holding has again changed hands. Earl Russell, who owns a portion of the hill, has evinced deep interest in the conservation of the mounds on his land, and they are preserved intact.

OBITUARY.

MR. JOHN CALLCOTT HORSLEY, R.A., died at his Kensington residence on Monday in his eighty-seventh year. He was the son of William Horsley, the musician, and a grandnephew of Sir Augustus Calcott, the eminent painter. In the early twenties his first picture was exhibited at the Academy. This was "The Pride of the Village," now in the Vernon Collection. This was followed by a long series, and for many years his contributions were a notable feature at the annual exhibitions. In 1843 his cartoon of "St. Augustine Preaching" gained at Westminster Hall one of three prizes, in the second rank, of £200, and in a competition in the following year he obtained by his two small frescoes a place among the six painters commissioned to execute further samples for the Palace of Westminster. That of 1845, for "Religion," was approved, and the subject was executed in the House of Lords. His well-intentioned protests against representations of the nude figure attracted much public notice. In 1882 Mr. Horsley, who had been a full Academician since 1865, was elected a treasurer of the Royal Academy, and he was for many years active in bringing together the annual winter collection of Old Masters at Burlington House. On attaining his eightieth year Mr. Horsley resigned his position of treasurer, and joined the list of "Retired Academicians." Sir Victor Horsley, the eminent surgeon, is his son.

THE death is announced at the age of 63 of Mr. H. W. YOUNG, M.S.A., of Greymouth, New Zealand, who was a native of Camberwell. He went to New Zealand in 1863, and to the West Coast in 1865 to join his brother, Mr. R. A. Young (now of Westport), who had arrived a few months earlier. Until 1873 the brothers remained on the goldfields, mining and practising their profession. As architects they designed the Greymouth, Hokitika, and other large public schools and ecclesiastical buildings, including Trinity Church, Greymouth. For a couple of years Mr. H. W. Young had been in Wanganui; but in 1886 he accepted the appointment of chief assistant engineer in the colony for the Midland Railway Company, which he held for ten years. Since 1896 Mr. Young has been in private practice as engineer and architect, and in both capacities was associated with nearly every important work or building on the coast. He was one of the first members of the Society of Architects, having been elected in 1884. Mr. Young was a cousin of the Right Hon. Joseph Chamberlain, his mother and Mr. Chamberlain's mother being sisters.

At the last meeting of the Sunderland Corporation the Finance Committee were directed to take steps to borrow £50,170 in respect of the erection of a quarter sessions and police court, fire station, &c., for which the tender of Mr. J. W. White has been accepted.

On behalf of the Local Government Board, an inquiry was conducted by Major C. E. Norton, R.E., at the Council Chamber, Benwell, with respect to the application of the Benwell and Fenham Urban District Council for sanction to borrow a further sum of £3,100 for works of sewerage. Mr. H. W. Taylor, of Newcastle, the engineer, explained the plans.

The Earl of Lathom, Provincial Grand Master of West Lancashire, recently laid, with Masonic honours, the foundation-stone of a new church in the village of Newchurch, near Warrington. The new building will take the place of the old parish church, which was burned down in April. In that church the notorious Colonel Blood, who attempted to steal the Crown jewels from the Tower of London, was married 250 years ago. The Bishop of Liverpool announced that £6,000 of the sum of £7,000 required for the new building had already been subscribed.

The parish church of Allington, Kent, has been reopened after the completion of mural decoration in the chancel and Lady-chapel, carried out by Mr. Godfrey Gray.

Whitby Urban District Council have decided to apply to the Local Government Board for their sanction to the raising of a further electric lighting loan of £5,000 for the extension of cables and additional plant, in connection with the electric light undertaking.

There are immense forests of Aleppo pines in Algeria, which have up to now been considered of little value. The suitability of this wood for road paving and for timbers for mines and telegraph posts may have the effect of enhancing the value of these forests.

PROFESSIONAL AND TRADE SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—At a meeting of this society held in the Free Library, William Brown-street, on Monday evening, Mr. Peter Cowell, librarian, read a paper on "Venice." A number of lantern slides were exhibited, and the address dealt with the beauties of Venice from an architectural point of view. On the motion of Mr. Rees, seconded by Mr. Grayson, a vote of thanks was passed to Mr. Cowell. The chair was occupied by Mr. John Woodfall.

CHIPS.

It is proposed to build on the site of the disused Malone Felt Works at Belfast a People's Palace, at a cost of £12,000. The hon. secretary and architect is Mr. J. W. Roome, M.R.I.A.I., M.S.A., of that city.

The foundation-stone of the King's Sanatorium for Consumptives at Lords Common, near Midhurst, will be laid on Nov. 3 by the King.

A practical proof of the interest taken by Lord Curzon in the restoration of ancient monuments is the grant-in-aid of Rs.14,372 just sanctioned from Imperial revenues for archaeological work in Bengal. The grant is intended for repairs to the tomb of Buktari Khan near Channpur, Shahabad, for repairs to the ancient remains at Pandua and Tribeni in Hooghly, and for re-erecting the broken Asoka pillar at Rampurwa in Champaran.

On the recommendation of the waterworks committee, the corporation of Manchester will seek powers in the next session of Parliament to construct a reservoir 105 acres in extent at Heaton, of which area 45 acres will be taken out of the public recreation-ground known as Heaton Park.

A great canalisation scheme is being initiated in the Midlands by which it is intended to link Manchester and Liverpool with the Potteries, Wolverhampton, and Birmingham. A surveying party are making an exhaustive examination of the levels with a view to the launching of the scheme in the course of a few months.

The central tower of Truro Cathedral will be completed by the end of November or the early week of the closing month of the year.

Torquay Town Council, at a special meeting, have decided by 26 votes to 3 to accept proposals by the Dolter Electric Traction Company for the installation and maintenance by the company of electric tramways in the town. The system to be adopted is that of surface contact. The power main is underground, being connected with the surface every few yards, and the tram picks up the current by means of a skate, which touches the studs connected with the main, and thus transmits the power to the tram motors.

Mr. R. H. Bucknell, Local Government Board inspector, has held an inquiry at Ossett, into an application of the corporation for sanction to borrow £1,200 for the purchase of land in Church-street, and £3,750 for the erection thereon of a refuse destructor, £210 for a cart shed and mortuary on land in Ilkworth-street, and £700 for a contribution towards the construction of a new bridge over the River Calder at Healey.

A Primitive Methodist church and schools in Harehills-avenue, Leeds, built at a cost of £6,500, were opened on the 7th inst. The church, designed by Mr. W. H. Dinsley, of Chorley, and built by Mr. Walter Lolley, of Leeds, is cruciform in plan and in the Gothic style. With the exception of a small gallery, the seating accommodation is on the ground floor. The rostrum faces the main entrance, and behind it is the orchestra. There is accommodation for a congregation of 550. The windows, glazed with lead lights, have been specially designed. The roof is partially open, and all the visible timbers are stained and varnished. The internal walls have broad dadoes. There are electric lights throughout, and the heating is by hot water. The school will seat 300, but it also comprises four classrooms, an infants' room, and a vestry.

A special meeting of the parishoners of St. Peter's Church, Burnley, was recently held to consider proposed alterations at the church. These include the taking out of the west gallery, the erection of a clergy vestry, the placing of the baptistery under the tower, and the installation of the electric light, &c., estimated to cost about £4,000. The Bishop (Dr. Hoskyns) presided, and explained that there was a recommendation from the church officers to modify the scheme now in hand, and to pull down the south gallery and extend the north gallery to the west end of the church. This would mean a net loss of 76 sittings. The recommendation was adopted, and it was also decided to remove the pulpit from the north to the south side of the church.

Mr. W. J. Potter, of Ashford, Kent, has been elected district surveyor to the rural district council of South Stoneham, Hants.

Building Intelligence.

BRISTOL.—An important block of business premises is about to be erected in College Green. Messrs. Wilkins and Sons, the contractors, are already demolishing the old premises, which have stood on the site for nearly two centuries. The new buildings comprise new premises for Messrs. Hughes and Son, estate agents, and an extension of Mr. P. E. Gane's furnishing establishment. The latter will be treated to correspond with the present front of Mr. Gane's central block, but for Messrs. Hughes and Son's frontage a design has been prepared by Messrs. La Trobe and Weston, F.R.I.B.A., of Bristol. The ground floor, of red Swedish granite, treated with severe simplicity, will support two stories of plain Bath stone leading up to a richly-ornamented attic story surmounted by a carved pediment. Each of the two stories over the ground floor has a circular bay window in the centre, with small windows on each side; between these will be a panel of gold mosaic, and on each side canopies of beaten copper-work. Mr. Gane's new premises will comprise on each of the four floors a showroom, about 80ft. in length. During the summer Mr. Gane has already added two new showrooms in the rear of College Green each of 90ft. by 23ft.

GOLDENACRE, EDINBURGH.—St. Serf's Established Church, Trinity and Ferron-road, Goldenacre, was opened on Saturday. It will hereafter be completed by the additions of another transept and the chancel. The building as it at present stands is in 15th-century style, and consists of a nave with side aisles, divided by red polished stone pillared arches, and one transept, also a temporary chancel, which occupies a portion of the chancel arch, the remainder being filled in. The roof of the nave is circular timbered, resting on the pillared arches, the principal timbers being supported on capped corbelled trusses. The entrance hall, over which is placed a loft gallery facing the chancel, is divided by a carved and glazed wooden screen from the church. The exterior of the church, which is in red and white stone, is heavily buttressed, and pierced by many richly foliated tri-light windows. The electric lighting is carried out on modernised Mediaeval lines. Opal open cups spring from black suspended ring girandoles, which enhances the severe style of the building. The chair sitting accommodation is for over 600, but when complete the building will seat about 1,000. The church, which was illustrated in our issue of December 6, 1901, by plan and perspectives of exterior and interior, has been erected from designs by Mr. George Watson, Edinburgh, whose design was selected in competition by the assessor, Mr. J. MacVicar Anderson, of London.

LITTLE ILFORD.—In the City of London Cemetery, Little Ilford, on Wednesday, Mr. R. W. Edwards, the chairman of the Sanitary Committee as the Burial Board for the City of London, laid the foundation stone of a crematorium, which will be erected at a cost of £7,000. The design provides for a hall 27ft. in length by 24ft. in width for the mourners to assemble in, with a large waiting-room adjacent and leading from the hall. The cremating chamber will be at the rear of the hall, and will be of sufficient size to admit of two cremating furnaces being erected. At the present time, however, it is intended to erect only one furnace, the flue of which will be carried up in the centre of a tower about 80ft. in height. The design of the crematorium is Gothic in style, and is intended to harmonise with the existing chapels and buildings in the cemetery. The designs were prepared by Mr. D. J. Ross, M.Inst.C.E., the city engineer, and the contract has been taken by Mr. B. E. Nightingale, Albert Works, Albert Embankment, S.E.

LONDON COUNTY COUNCIL.—At their meeting on Tuesday the Council reversed the decision of the Bridges Committee to accept the tender of Messrs. Heenan and Froude, at £154,584, for the building of Vauxhall Bridge, and accepted the tender of Mr. Charles Wall, of London, at £142,942. It is to be regretted that without discussion the members declined to alter the line of the Strand frontage, near the eastern corner of Aldwych, as suggested by the Further Strand Improvement Committee. It was reported that the annual rental value of the sites offered for sale by auction last week was, as regards the Holborn to Strand scheme, £11,000 a year.

MIDDLESBROUGH.—On Saturday afternoon

Lady Constance Emmott laid the corner-stone of the new Church of St. Michael and All Angels at Middlesbrough. The sacred building is being erected in Waterloo-road, to the north of the Albert Park, in one of the portions of the town which has sprung up with such rapidity during the past year. Mr. Wm. Duncan, of Middlesbrough, is the architect for the new building, the tender for the erection of which has been let to Messrs. Bastiman Bros., of Middlesbrough, for £5,430; but the fittings, &c., will bring up the total cost of the undertaking to fully £6,000. The new church will provide seating accommodation for 500 worshippers.

OXFORD.—During the Long Vacation which ended on Friday night various improvements have been carried out in the University buildings. Magdalen College hall has now the new timber roof which has long been desired. The work has cost several thousands of pounds, which was provided by a former Fellow of the College, Mr. H. E. F. Garnesey, who unfortunately died the very day the contractor began. The plaster ceiling which has been removed was placed in the College between 1790 and 1800 by Wyatt. Designed by Mr. G. F. Bodley, R.A., the new timber roof is of the flat pitch which was common at the period when the College was built. When the plaster was removed from the walls at the east and west ends, just before the new roof was to be erected, indications of the original timber roof were discovered. These proved that the new roof is a fairly exact restoration of the one existing at the end of the 15th century. A window which had been covered in at the east end of the hall was discovered, and this has now been restored from the remains of the tracery and filled with stained glass. An enlargement has been made at Somerville College. The scheme includes a library capable of containing 30,000 volumes. The new buildings are from the designs of Mr. Basil Champneys, and are in the Renaissance style. In the centre is a loggia, 40ft. long by 13ft. wide, connecting the old and the new buildings. At University College, Mr. H. W. Moore, architect, of Oxford, was some time ago instructed to prepare a report upon the possibility of removing the plaster vaulting from the College dining-hall to allow of the original roof being opened out. His report was favourable, and the work is being carried out. The hall is also being extended about 20ft. A new building providing twenty-four additional sets of rooms has been added to Hertford College. There has been a great extension of the electric light throughout the University, and the illuminant has now been installed at Merton, Queen's, and Mansfield Colleges, Christ Church Hall, and Pembroke College Chapel.

SALFORD.—The Countess of Aberdeen opened on Saturday the Girls' Institute, the cost of which (about £8,500, exclusive of site and fittings) was defrayed by the trustees of the late John Harling. The building which is on the Regent Road Barracks site facing Huddart-street, is in the Renaissance style, and is of red brick, with buff terracotta dressings, from Northwich. There are a restaurant, a gymnasium, laundry, washhouse, kitchen, scullery, pantries, and a cookery classroom on the ground floor. Above these is a large assembly hall, with ten classrooms opening from it. The committee-room is on this floor. The hall is lighted through a domed lantern, which forms a feature of the building both internally and externally. The institute is fitted with hot and cold water supply, hot-water heating apparatus, and a separate system for steam cooking, and is lighted by electricity. There is a house for the caretaker, and an emergency exit has been provided in case of panic. The architects were Mr. J. Earnshaw and Son, Manchester, and the contractors Messrs. Burgess and Galt, of Ardwick, Manchester.

ST. HELENS, LANCs.—The new buildings erected at the corner of North-road and Corporation-street, St. Helens, as the headquarters of the St. Helens Young Men's Christian Association, were opened on Friday by the Earl of Aberdeen, G.C.M.G. The premises have been erected in the Renaissance style from plans prepared by Messrs. Briggs and Wolstenholme, of Liverpool and Blackburn, the work being carried out by Mr. Joseph Ellison, builder and contractor, St. Helens. Ample accommodation is provided for clubs in the way of rooms for dressing, storage of cycles, lavatories, &c. On the first floor are the reception-hall, inquiry office, secretary's office, newsroom, library, and lounge. The

library and lounge have been furnished in fumed oak and upholstered in antique tapestry with a polished block floor. One of the main features of the building is the "Windle-Pilkington Hall," a room providing seating accommodation for 220 persons. Several tradesmen's lock-up shops have been constructed beneath the association's rooms. The top of the building has been formed into a roof-garden and open promenade, and plants and shrubs will be provided. Seats are also provided, and a view of the town and surrounding districts can be obtained. The total cost has been about £9,000, while the furnishing has taken an additional £500.

SOUTHGATE.—On Saturday the foundation-stone of the church of St. John the Evangelist, Palmer's Green, was laid by Mr. V. E. Walker. Mr. J. Oldrid Scott, F.S.A., is the architect, and it is proposed to build the chancel, side-chapel, vestries, and two bays of the nave, thus providing accommodation for about 400 worshippers. The cost of this will be about £9,000. In the previous week the foundation-stone of the church of St. Andrew (to take the place of a worn-out iron church) was laid in the northern part of the parish of Southgate. Three bays of the nave, with accommodation for about 300 people, are being built. The architects are Messrs. A. R. Barker and Sen. The total cost will be about £3,500.

SWANSEA.—The new harbour offices at the corner of Adelaide-street and Somerset-place were opened by the mayor last week. The buildings are faced with red brick, and white stone is employed for dressings. A square tower covered by a dome of copper, surmounted by a gilded vane representing a ship of antique design, rises near the angle. The upper part is decorated with sculptured figures representative of "Discovery," "Commerce," "Engineering," and "Navigation," and the pediments of the building are also embellished with seated female figures. The sculpture and carving have been carried out by Mr. Houghton, of Swansea, and Mr. T. Jones, of Cardiff. The contractors are Messrs. Lloyd Brothers, of Swansea, who have erected the buildings from the designs of Mr. Edwin Seward, F.R.I.B.A., of Cardiff. A wing contains further offices, together with new premises for the Capital and Counties Bank. The chief features of the interior are the range of offices for the general superintendent, engineer, solicitor, accountant, &c., with their staffs, and the shipping department. The approach lobbies and corridors are fitted with screens in teak. On the first floor is the board-room, with a wagon-head roof containing plaster decoration, and surrounded by a high dado of polished teak. The windows are decorated with medallions in stained glass, indicating the engineering and shipbuilding arts, &c., and a large lunette at one end will be filled by decorative painting, representing ancient shipbuilding at Swansea, by Mr. Morton Nance, of Penarth. Mr. William David has acted as clerk of works.

WINCHESTER.—The City Museum has had many peregrinations, and has now been finally placed in a suitable and handsome structure in the Domestic Gothic style, designed by Mr. Nisbett (Colson, Nisbett, and Farrer), of Winchester. The structure stands just in the route of visitors to the cathedral, and is very central. The museum in its first stage was in the old schoolroom of Richards's famous Hyde Abbey School, thence it moved to the governor's house of the old gaol on Jewry-street, then to the garret-like rooms under the skylights of the Guildhall, and now, at last, it occupies a house in the Square. The new structure has been erected by the corporation to provide accommodation for the collections formerly housed at the Guildhall, now required for the extension of the municipal offices. The building is on the site of the old Mechanics' Institution, a construction consisting very largely of lath and plaster, originally erected as a market room, and used later as a theatre. Even then, however, the building was not entirely new, as several of the old oak beams and some columns of the earlier market house were found incorporated in the fabric, and where possible these have been preserved in the new museum. Close to the site Dame Alice Lisle was beheaded, of which event it is proposed to place a record in the museum. The new building consists of three stories, with one large room at each level, and to economise space the stairs are placed at the end near the entrance. The room on the ground floor is 10ft. by 31ft., and is lighted by three windows on each side. This room will contain Roman and

Medieval antiquities, and the upper the varied curios found in local museums. The room on the first floor is about the same size, and is devoted to the display of the fine Northesk Loan Collection of prehistoric stone and other implements, as well as weapons, &c., illustrating the handiwork and usages of modern savages. The top room is formed in the roof, and, in addition to three windows on the north side, it has a top light. The old cases which contained the Natural History collection at the Guildhall have been rearranged, and it is hoped in time will be refilled with specimens of local interest. It is also proposed to arrange the Geological specimens in this room. Externally the building is faced with flint, with dressings to windows, doors, and quoins of Monk's Park stone. The opening ceremony took place on Thursday afternoon in last week.

CHIPS.

Messrs. Dorman, Long, and Co., Ltd., of Middlesbrough, who have secured a large order for the Indian State Railways, have now commenced rolling, at their Port Clarence Steel Works, near Middlesbrough, a large number of bull-headed rails. The same firm, in conjunction with Messrs. Bolckow, Vaughan, and Co., of Middlesbrough, have also been successful in securing important contracts for the permanent way material required for 200 miles of railway in South Africa, or a total of about 23,000 tons of rails.

The city council of Newcastle-on-Tyne adopted at their last meeting a scheme for the erection of artisans' dwellings in the Ouseburn district, on a site between Walker and St. Lawrence-roads, and estimated to cost, including land, compensation, streets, and buildings, £23,670. They also decided to seek Parliamentary powers next session to construct nine additional routes of electric tramway extension. The city engineer's estimate for construction was £133,850, and the general manager's estimate for electrical equipment was £156,476—a total estimated cost of £290,326.

Messrs. J. B. Joyce and Co., Whitchurch, Shropshire, have been favoured with the order of a large striking turret clock, to be erected in the stable yard at Hardwicke Grange, Shrewsbury. The same firm are also making a striking clock for the new church of St. George, Barbourne, Worcester, and are now fixing clocks at Rainford Church, St. Helens, and Silk Willoughby Church, Sleaford.

Mr. Chas. F. Hayward, architect, district surveyor for Bloomsbury, St. Martin, Soho, and Covent Garden, has removed to 50, Great Russell-street, W.C.

The church of Holy Trinity, Frogmore, near St. Alban's, was reopened last week after the addition of an organ-chamber to the north transept, and the reconstruction and removal of the organ. Messrs. Blomfield prepared the plans for the alteration to the organ-chamber, and in accordance with these Messrs. Boff Bros. executed the work. Messrs. Speechley, of London, were intrusted with the readjustment of the organ.

The memorial to Huntingdonshire men who fell in the late South African War, erected at the corner of George-lane, Huntingdon, near All Saints' Church, on property belonging to the town, will be opened to-day, Friday, by General Lord Grenfell. The monument was designed by Messrs. Davies and Scott Gatty, and represents a figure of St. George, the Patron Saint of England, upon a pedestal of Portland stone, on which are carved the names of the soldiers, and surmounted by a hexagonal roof of oak, overlaid with copper, crowned by a lantern, also of copper.

New offices have just been built for an accountant in Orford-place, Norwich, from plans by Messrs. C. J. and F. W. Skipper of that city. The front is of terracotta, harmonising with the adjoining savings bank, and the style of the premises, which are three stories in height, is French Renaissance. Mr. J. S. Smith, of Norwich, is the builder, and the terracotta work was supplied by Messrs. Doulton and Co., of Lambeth.

Letters of administration of the estate of Mr. Herbert Ford, F.R.I.B.A., of Homeleigh, South-row, Blackheath, and 21, Aldermanbury, have just been granted, the value of the property being £22,547 4s.

The partnership heretofore subsisting between P. B. Houghton and F. C. R. Johnson, architects, Chesterfield, under the style of Houghton and Johnson, has been dissolved.

On his retiring from the post of manager to accept a like position at Birmingham, Mr. Alfred Baker has been presented by the indoor staff of the London County Council's South London Tramways with a tantalus, a drawing-room clock, and brass ornaments, together with an afternoon tea service and a case of spoons for Mrs. Baker.

Engineering Notes.

LONDON ELECTRIC TUBE RAILWAYS.—At the half-yearly meeting of the Underground Electric Railways Company of London, held on Friday, the chairman, Mr. Yerkes, explained the measures which are being taken to guard against an outbreak of fire on the lines controlled by the company by employing only non-combustible materials, cement being used in place of wood for all platforms, and iron for staircases. The existing stations on the District line will be remodelled on this principle. As to new works, Mr. Yerkes mentioned that the underground work on the Baker-street and Waterloo line between Baker-street and Waterloo is practically finished, and attention is now being turned to the completion of this line. A connection will be made between this line and the District of that at the Charing-cross Station of the District Railway. The Baker-street and Waterloo Company have decided to extend their lines from Waterloo Station to Elephant and Castle, and the work there is now being pushed forward rapidly, while the extension from Baker-street to Edgware-road is about to be commenced. When this latter is finished, the line will be still further carried on to Paddington. The other lines controlled by the company, the Great Northern, Piccadilly, and Brompton, and the Charing-cross, Euston, and Hampstead, are also, he declared, making good progress.

The urban district council of Stourbridge have adopted a scheme of electric light installation. It was decided to apply to the Local Government Board to sanction a loan of £16,000 for the works, and to appoint Mr. J. B. Clarke as electrical engineer at a salary of £200 per annum.

A general meeting of the Competition Reform Society, of 10, Gray's Inn-square, London, W.C., will be held on Thursday, the 29th inst., at 9, Conduit-street, W., at 5.30 p.m., to consider the resignations of three members of the committee and the events which led thereto, and to elect new members to the committee.

Mr. Alfred J. Dunn, A.R.I.B.A., has, on account of pressure of work away from Birmingham, resigned his lectureship in building construction and drawing at the Birmingham Municipal School of Art (elementary, advanced, and honours). The committee, at their meeting on Monday afternoon, appointed as his successor Mr. Francis B. Andrews, A.R.I.B.A.

The South Canterbury Hospital, Timaru, New Zealand, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. R. S. Oldham, who has been in the service of the Trust for nine years, has been appointed resident engineer for the construction of the new dock works at Swansea at a salary of £300 a year, rising to £400 by £20 increments.

The death occurred last week at his house in Rossie-street, Arbroath, at an advanced age, of Mr. Charles Gordon, master builder, of that town. For over fifty years Mr. Gordon had been successively a deacon and elder in Ladylow U.P. Church.

The new fever hospital at Colinton Mains, which is to be open for the reception of patients next week, was officially inspected on Friday by members of the Edinburgh Town Council. The members were accompanied by Mr. Morham, the city superintendent of works.

Mr. Richard Hirst, who for ten years has been Lloyd's engineer surveyor at West Hartlepool, has been promoted to the position of senior engineer surveyor for the port of Liverpool. Mr. T. S. Warren, the principal ship surveyor at West Hartlepool, will be transferred to Sunderland.

During the harvest festival, held at the parish church of St. Bartholomew, at Crewkerne, on Sunday, the Ven. Archdeacon W. H. Askwith dedicated the costly new reredos and altar which have just been presented to the church. The reredos is of Ham Hill stone; the central panel, measuring 7 ft. 6 in. by 3 ft. 6 in., contains a reproduction of the Last Supper. The altar is of oak, resting upon steps, and a foot-pace of Devonshire marble. Both works are by Messrs. Harry Hems and Sons, of Exeter, who also executed the oak stalls and a statue of the patron saint in the south-west porch. The architect was Mr. J. Howard Gaye.

The casting of a bronze memorial statue to Prince Christian Victor, which is to be erected at Windsor, took place last week at the bronze foundry of Messrs. Hollinshead and Burton at Thames Ditton. The statue has been modelled by Mr. W. Goscombe John, A.R.A.

COMPETITIONS.

MULREADY PRIZE.—The council of the Society of Arts offered, under the terms of the Mulready Trust, a gold medal, or a prize of £20, for competition among students of the Schools of Art in the United Kingdom at the annual competition for the present year. The prize was offered to the student who obtained the highest awards in certain subjects—all life studies. This prize has now been awarded to Thomas Corrie Derrick, of Queen's-road School of Art, Bristol. The previous awards of the Mulready Prize were made in 1884, 1893, and 1896.

TAUNTON.—At the last meeting of the town council the free library committee reported that the trustees had offered prizes of £30, £20, and £10, in order of merit, for the three best designs for a free library, to be erected in Corporation-street, immediately opposite the municipal buildings. Conditions of competition were issued, and 81 sets of designs were sent in. The first prize was awarded to Mr. A. Colborne Little, of 9, Gray's Inn-square, London, and his revised designs were approved by the council. Photographs of the designs will be forwarded to Mr. Carnegie (the donor of £5,000 for the erection of the building), with plea for his promised contribution, so that the building may be proceeded with at once. The education committee presented a scheme for the formation of a county and borough joint committee for science and art, and the building of a new school of art in Corporation-street. It was proposed to erect on a site in Corporation-street, to be purchased from the town council, a building to be used as a school of art, the cost of which had been roughly estimated at from £2,000 to £3,000. The committee asked the council to authorise them to proceed with the necessary arrangements for completing the scheme and bringing it into operation. This recommendation was adopted by the council.

Inscriptions in English and Welsh have been placed on the Celtic cross erected by the Hon. F. G. Wynn on Llanddwyn Island, near Carnarvon Bar. The cross is intended to commemorate St. Dwywen, the patron saintess of the island, which has on it the ruins of an ancient abbey. It stands about 14 ft. high, and on one of the blocks are the words "Remember the dead who lie around; remember you are on holy ground." The work was executed by Messrs. Hugh Jones and Co., Carnarvon.

Two new underground conveniences have just been constructed by the Lambeth Borough Council, the one situated on the Surrey side of Westminster Bridge, opposite St. Thomas's Hospital, the other at the junction of Loughborough-road with Coldharbour-lane. Both were constructed under contract by Mr. J. Parsons, of Waterloo-road, from plans prepared by Mr. Henry Edwards, the borough engineer. The contract for the structure at Stangate was £3,298 and at Loughborough £2,495.

A conference has been held of representatives of the Middlesbrough Corporation, the urban district council of Ormesby, and the urban district council of Normanby, at which Mr. Robert Hammond, of London, consulting electrical engineer, attended, and reported on a scheme for the authorities concerned undertaking themselves the proposed considerable tramway extensions. The conference recommended the councils represented to adopt the scheme, and to take all such steps as may be necessary for carrying the same out.

Plans have been approved by the Hull Corporation Property Committee for the erection of a bridge over the River Hull at Stoneferry, which is to cost £36,000.

The Great Western Railway Company will promote a Bill in the ensuing session of Parliament to carry out extensive work, whose effect will be to place Swansea on the main line and open up the rich anthracite coalfield north of the town.

The foundation-stone of the new free library in the People's Park at Limerick was laid by Mr. Carnegie on Tuesday. Mr. Gaze F. Beckett, of Dublin, whose design was recently chosen in competition by Mr. Ashlin, the assessor, is the architect.

A public meeting was held on Monday at the Stamford Hill Congregational Church in furtherance of the proposal to convert the Springfield Estate, Upper Clapton, into a public park. It was explained that £40,000 was required in order that the park might be secured. Towards this sum the Hackney Borough Council had promised £10,000 and the London County Council £20,000, so that £10,000 had still to be secured. The London County Council would bear all the expenses of the upkeep. It was resolved to form a committee to take the necessary steps to obtain the balance of the sum required.

CONGREGATIONAL CHURCH AND SCHOOLS, ABINGTON
AVENUE, NORTHAMPTON.

This is a design prepared by Messrs. C. Dorman and Son, architects, of Northampton, for a chapel and schools to be erected in a residential part of the town, and, when completed, will form a compact block of buildings well adapted for the purpose intended. The ground, which has streets on three sides, is 150ft. long by 100ft. deep. The main body of the church is a hexagon, with transepts on three sides and galleries over: the whole is arranged to seat 1,000 people. The entrances are placed at four corners, with staircase to galleries. In the rear are a pastor's, deacons', and ladies' vestries, with necessary conveniences. The schools, which are already built, contain, on the ground floor, a large room, 44ft. long and 39ft. wide, an infants' room, 29ft. by 21ft., two classrooms, each 10ft. 6in. square, lobbies, staircases, &c. On the first floor is the church parlour, 43ft. long and 37ft. wide, with two large classrooms and lavatory accommodation. There are kitchen, caretaker's store, and heating chamber in the basement. Local bricks are being used, with Bath stone dressings. The interior woodwork is in pitch pine, varnished. The whole scheme is estimated to cost £10,000.

GARDEN HOUSE AT WALMER AND PERGOLA
AT COURTLANDS.

THESE two colour drawings represent architectural detail in two of Mr. Mawson's recent garden schemes. The Garden House at Walmer Lodge is erected at the end of a somewhat extensive terrace, and is built of brick rough-casted and whitened, and the dressings are of freestone. The Pergola at Courtlands, Goring, is also part of another terrace scheme, and, as shown, suggests a fair treatment of square columns rough-casted, with heavy cross-beams, upon which are trained to grow all manner of climbers to form a shady walk leading up to a pavilion. These drawings both appeared in this year's R.A. Exhibition. The drawing of the Pergola at Courtlands is by Mr. C. E. Mallows, while the one of Walmer Lodge is by Mr. A. N. W. Hodgson. The architect is Mr. Thomas H. Mawson, of Conduit-street, W.

BUNGALOW AT WAMBROOK, NEAR CHARD.

THIS bungalow has been built on an estate some three miles from Chard. The materials used are Wellington dark red bricks, with Ham Hill stone dressings. The roofs are covered with hand-made tiles from the Somerset Trading Co.'s yards, Bridgwater. The natural contour and surroundings of the site lend themselves successfully to the general effect of the style selected. The work has been carried out by Messrs. Harris and Woolcott, contractors, Chard, from the designs, and under the superintendence of, the architect, Mr. Arthur W. Yeomans, of Chard, Somerset.

KING'S PARK BURGH SCHOOL, DALKEITH.

THIS new school has been erected on a site acquired by the board in a central position lying between Croft-street and the King's Park. The new buildings at present consist of a main block two stories high to accommodate an infants' department, senior and junior elementary departments, and a secondary department. There are ten classrooms, five on each floor, all entering from one side of a wide corridor running the whole length of the school, with boys' porch at one end, and infants' porch at the other. Adjoining the boys' porch is a room for the janitor with kitchen range, and of sufficient size for use as a lunch-room for children coming from a distance. The staircases are on the other side of the corridor, where there are also ample cloak-rooms for pupils, and staff-rooms for the teachers on each floor, and an entresol floor. There are besides other entrances for boys and girls at the bottom of each staircase. The corridors are lofty, being carried nearly the same height as the classroom ceilings, which are about 15ft. high, and special attention has been paid to light and ventilation throughout, the result generally being a feeling of airiness and spaciousness which would tend to make the building among the healthiest of its kind. The main block has been designed so as to permit of the addition of further classrooms without disturbing the carrying on of school work, and provision has also been made for connecting the main building by means of a corridor with a separate building for which space has been reserved in the playground, alongside Croft-street, which could be used either entirely as secondary department or higher grade school, as future requirements necessitate. The classroom accommodation at present provided is for 610 pupils; but the administrative departments, staff rooms, cloak-rooms, &c., have been designed to cope with future extension. The site permitted of playgrounds of ample proportions, with entrances from both Croft-street and Parkside-place, and there are the usual offices and playsheds for boys, girls, and infants. The main front of the school containing the classrooms is well seen from the road leading from Eskbank Station to Dalkeith. The walls are of stone, faced with cream-coloured coursed rubble, with bands at the sill and lintel levels, cornice course, and high dormer windows to the principal classrooms, with gables or pediments projecting above the general wall head level, and breaking up the sky line, such features and other hewn work being in red sandstone from Moat Quarry. The roofs are covered with green slates from Buttermere, ridged with red tiles; and in the centre of the main block is a large ventilator, finished with an open colonnaded cupola. The building is heated by means of hot-water pipes and ventilating radiators on the low-pressure system, worked from an apparatus in a basement heating-chamber, and hot-water service is provided for the teachers' and pupils' basins. The approximate cost, including boundary walls, laying out playgrounds, furnishings, and fittings, is £12,000. The principal contractors have been as under:—Mason work, Mr. Stephen Hair, Dalkeith; steel and ironwork, Messrs. Wm. Little and Sons, Edinburgh; fire-resisting floors, Messrs. Stuart's Granolithic Company. The work has been carried out from the designs and under the superintendence of Mr. Thomas T. Paterson, architect, Edinburgh; and Mr. W. G. Peddie was the clerk of works.

NO. CX. BROMPTON ROAD.

THIS building was completed in July last, and, as will be seen by referring to the plans, the ground floor consists of large butcher's shops, with meat store at rear and offices at side. In the basement a large cold store, sausage-making room, salting room, and washing space, &c., is provided. The whole of the upper part of building has been given over to the manager's apartments. The building was erected by Mr. A. R. Pocock at a cost of over £3,000, and Messrs. Syme and Duncan, of Beckenham, were the builders. The architects are Messrs. Blangy and Van Biars, 19, Old-square, W.C.

PROPOSED HOUSE, WITLEY.

MR. W. H. SETH-SMITH, F.R.I.B.A., is the architect of this house, but we have received no further particulars from him.

BOROUGH OF SUTTON COLDFIELD TECHNICAL SCHOOL.

THE designs for the above school were selected in limited competition, and the buildings are now

approaching completion. The levels of the ground have made it possible to obtain direct light from the rear for practically the whole of the basement. The scheme provides a very complete school for a small country town. It consists of a workshop for twenty-five pupils, with suitable workbenches of the London School Board pattern, lathe, tool cupboards, &c. The cookery school for practical work and demonstration contains three tables, each for six students, and has in addition a range, gas-stove, laundry-stove, sink, dresser, &c. On the ground floor is master's room, classroom, boys' cloakroom, lecture-room for 100 students, with preparation-room, and lecturers' table, black-boards, lantern arrangement, &c. The chemical laboratory provides accommodation for twenty-five pupils, and contains working-tables, fume closets, sinks, &c., of the latest pattern. The physical laboratory provides accommodation for twenty-five students, with balance-room adjoining. The upper floor contains art-room, modelling-room, and lavatories and cloakrooms for female students. The materials employed are 2in. hand-made bricks from Oldbury, the dressings are Box Ground and fine Hollington, and the style of architecture falls in with the older buildings in the town. The total cost, including fittings, will be less than £5,000. The architects are Messrs. Crouch and Butler, of Birmingham; and the builders Messrs. Turville and Son, of Sutton Coldfield.

CHIPS.

The parish church of Malins-Lee, Salop, was reopened last week after restoration at a cost of £800.

It has transpired that the statue of Queen Victoria, about to be erected on the Promenade at Southport, the order for which was given to Mr. G. J. Frampton, R.A., has been cast by a firm of German bronze founders. The contract price was £1,750.

The public free library at Lockerbie, N.B., was formally opened on Friday. It has cost £2,850.

At the Conference of the Lw Society at Liverpool, on Wednesday, a discussion took place on the Land Transfer Act of 1897, under which there is now compulsory registration of titles for the County of London. The Act was criticised as a failure, it being stated that it was costly and useless, and a resolution was adopted asking for an independent inquiry into its working.

On Monday week the Bishop of Lincoln reopened the ancient parish church of St. Nicholas, Haxby, which has been for some time past undergoing restoration. The bells have been recast, the tower improved, and the church entirely re-seated with oak seats in place of the old-fashioned square pews.

The Bishop of Southwark on Saturday consecrated the new church of St. Silas, which has been erected in Waverley Park, Nunhead. The new church is constructed of stone in the Perpendicular style, and has a pitch-pine roof. It has seating accommodation for 750. Nearly £7,000 of the £8,000 required has been raised.

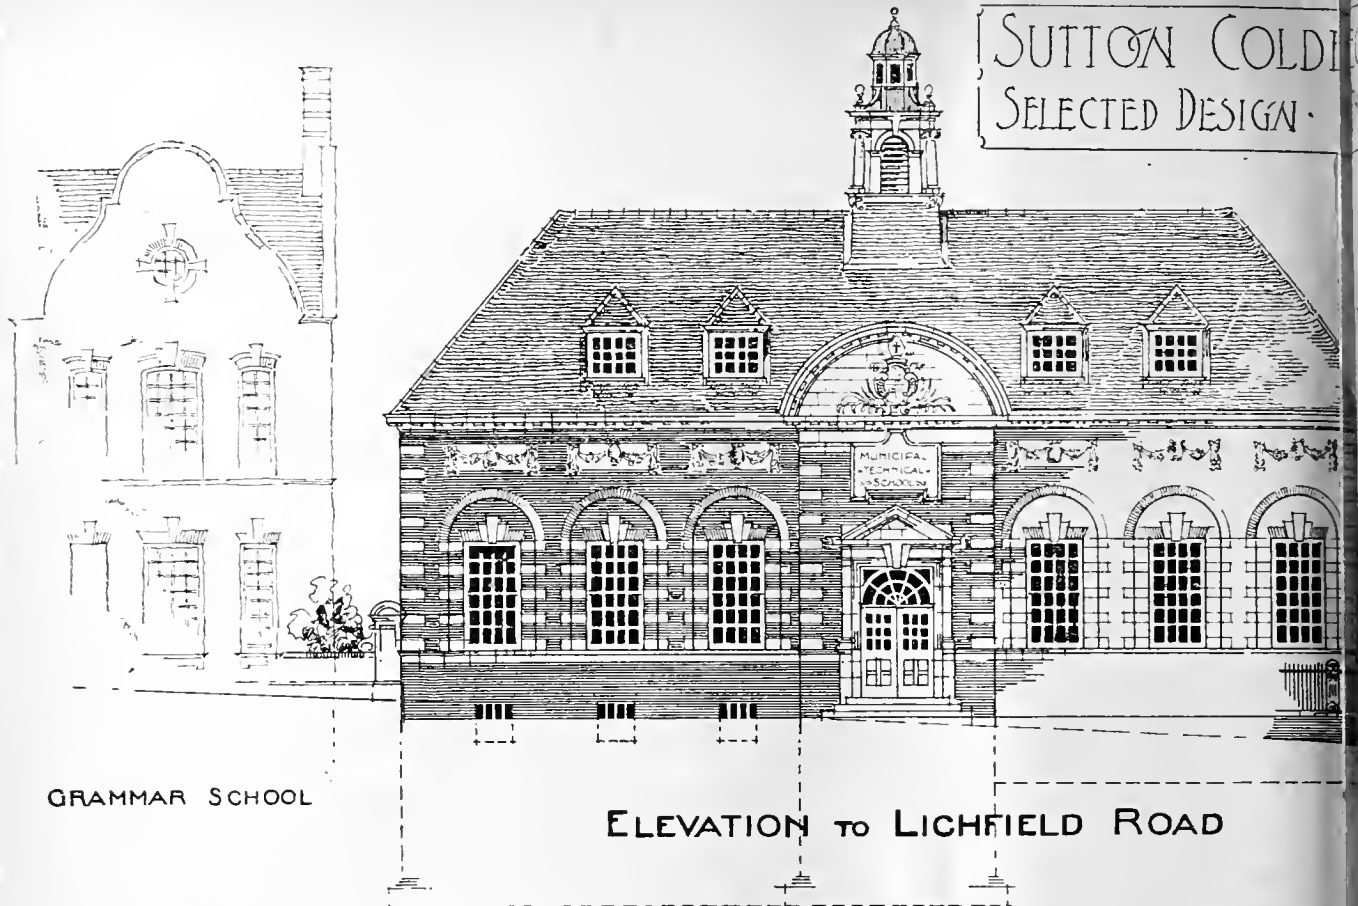

The Bishop of London has fixed Wednesday next (St. Simon and Jude) for the consecration of the church of the Holy Trinity, Kensington Gore. The church, which has been designed by Mr. G. F. Bodley, R.A., is constructed of stone externally and internally. At present the nave, chancel, and one aisle are built. The double aisles on the north side, which will be a great feature of the building, will be added when sufficient funds come in.

Two paintings by Miss Emily Ford, representing "The Three Wise Men" and "The Nativity," have been placed in St. Agatha's, Landport, in memory of their brother, the late Father Dolling, by the Misses Dolling. The paintings were originally executed at his desire for his school at St. Saviour's, Poplar. Miss Ford is engaged upon a third painting of "The Shepherds and the Angels," which is intended to complete the series, and will be hung with the other two at St. Agatha's, when completed.

The Board of Trade have confirmed the order made by the Light Railway Commissioners for the Dover and River Light Railway, authorising the construction of a light railway in the borough and rural district of Dover and parish of River, in the county of Kent.

The large addition to the resident population of Osborne, consequent on the establishment of the Royal Naval College, which was opened by the King in August, has necessitated a complete overhauling of the drainage arrangements previously in use. A complete set of new drains has accordingly been laid down by Messrs. Doulton and Co., of Lambeth, S.E., while the disposal of the sewage has been entrusted to the Septic Tank Company, of Westminster, who have laid down an installation on their well-known system.

CAPEL

FIRST FLOOR PLAN.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLII., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) for any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—R. H.—G. G.—Contractor.—T. L. (Preston). H. V. and Son.—Cement.—M. N. T. Bros. (Crewe).

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Sunny Jim," "Frena."

Intercommunication.

QUESTIONS.

[12015].—**Stove.**—What form of stove, without oil, coke, or coal, can you advise for warming a room about 12ft. square that has only an iron pipe chimney? There are gas-stoves innumerable, but I have not found one that is not objectionable. I believe I have seen recommended a small hot-water arrangement heated by gas.—GAS STOVE.

[12016].—**Draughts.**—I am about to prepare plans for a small and inexpensive house, and am anxious to avoid draughts in the sitting-rooms as much as possible. My own idea as to the cause of draughts, which are to be found in many rooms, even when the outer and inner doors are arranged to prevent direct currents, and when the windows are well fitted, is that they are caused principally by the current created in the flue by the fire, to supply which fresh air is sucked in at all crevices. I have two suggested remedies. The first: To supply air through chambers near the fire, in passing through which it is warmed, the supply thus obtained obviating the necessity to draw it from elsewhere. The second: To warm the entrances by radiators, so that air drawn in through the crevices of the door may be nearer the same

temperature as that in the room. I wish to obtain the desired result in the least expensive manner. I am quite aware that there must be a supply of fresh air, but think it should be possible to obtain it without unpleasant draughts. I shall be very glad to have other people's opinions as to whether my premises of the cause are correct; whether the proposed remedies are likely to be effective; and, if not, what better method to adopt?—VISEVEY.

[12017].—**Small Building.**—A carpenter friend of mine, a small builder, will take it down, but I wanted to get at the probable weight of it, and best method of bundling and packing. Will someone, therefore, tell me roughly? (1) What the weight is of corrugated iron per 100 or 1,000 super. feet; (2) the weight of lin. match-board; (3) of floor-joists generally used in a one-storied building, and of flooring; (4) and of the quartering, &c., used for uprights; (5) also, whether it would be profitable to transfer and re-erect the chimney brickwork in the country (North Hampshire), or buy new bricks down there; (6) the building measures 37ft. by 27ft., and perhaps you could give some idea of the cost of a chimney about 12ft. high, and of a concrete floor and of the foundations to stand the building on; (7) also the best way to deal with the widow-sashes and doors for the railway company to cart and carry.—G. FOSTER.

LEGAL INTELLIGENCE.

IN RE H. J. CAYE, MAIDA VALE.—At the London Bankruptcy-court, on Monday, a first meeting of creditors was held under the failure of Harry Jarvis Caye, builder, of Lauderdale Mansions, Lauderdale-road, Maida Vale. Mr. C. A. Pope, Assistant Official Receiver, presided. It appeared that the debtor began business ten years ago with a few pounds capital, and had since been engaged in building operations at Clapham, Willesden-lane, Haverstock Hill, and Maida Vale. He estimated his liabilities at £8,000, and attributed his insolvency to inability to let his buildings, interest on borrowed money, and failure to obtain permanent advances on mortgage. No proposal of composition was before the meeting, and Mr. Bournier, chartered accountant, was appointed trustee with a committee of inspection. The security to be provided by the trustee was provisionally fixed at £500.

THE LIVERPOOL TIMBER TRADE FAILURE.—In connection with the failure of Lightbound, Rigby, and Co., timber merchants, Liverpool, who also traded as the Saguaw Lumber Company, a meeting of creditors was held on Monday at the offices of the Official Receiver, who presided. The partners in the firm are Mr. Charles Latham and Mr. Ralph Norbury. The proofs of debt which had been sent in both upon the joint and separate estates having been read over, the Official Receiver said that he regretted that there was no statement of affairs to lay before the meeting. He understood that the books were not written up, and were not in a satisfactory state. When the statement of affairs was filed he, the Official Receiver, would have to investigate the matter, and make out his report and send it with the summary of the statement of affairs to all the debtors. The creditors decided to reserve any questioning of the debtors until they should appear for public examination on oath. A resolution for the appointment of Mr. W. C. Spencer, chartered accountant, of Liverpool, as trustee was passed unanimously, and a committee of inspection was appointed.

THE BRADFORD CORPORATION IMPROVEMENTS.—HAMYER AND OTHERS.—Lieut.-Colonel W. H. Wellsted, Mem.Inst.C.E., has issued his award in the above, amounting to £1,019. The claim was for the taking of 128 yards of land for the Church Bank improvement, and included the cost of altering the existing premises necessary through the alteration of the levels of the street adjoining. The valuation by the claimants' witnesses was £1,929, whilst that by the corporation witnesses was £457.

ARBITRATION CLAIM FROM SOMERSETSHIRE.—At the Surveyors' Institute, Westminster, before Sir Benjamin Baker, sole arbitrator, the case of Pearsons and the Great Western Railway Company has been in progress during this week. It is an arbitration as to the contract to decide the amount payable by the railway company to the contractors, Messrs. S. Pearson and Son (Ltd.), for the construction of the South Wales and Bristol Direct Railway from Wootton Bassett to Patchway. The total claim is about £1,600,000, but the amount in dispute is something approaching half a million. The company's contention broadly is, it is understood, that the contract was one for the execution of specified works for a lump sum, and though there might be certain extras during the progress of the contract to be added, yet substantially the amounts to which the claimants were entitled under the contract had already been paid to them. The proceedings are being held in private.

WATER COMPANIES' LIABILITY FOR REPAIRING STREETS.—The New River Company, of 173, Rosebery-avenue, were summoned at Clerkenwell Police-court, on Tuesday, for neglecting to pay the mayor, aldermen, and Councillors of Westminster the sum of £99 9s. 8d., due for expenses incurred in filling-in, making good, and maintaining the pavement in the streets within the City of Westminster where they had been broken open by the company. The

proceedings were taken under the Metropolitan Local Management Acts, 1855 and 1862. For the city council it explained that the dispute between the parties was as to the charges made by the borough council upon the water company with respect to the breaking-up of the streets. The council had revised these charges, and decided to add to them 10 per cent. for "supervision" in lieu of the water company making good any subsidence which took place within twelve months after the completion of the work, and which subsidence, it was added, always happened. The respondents objected that the Westminster Borough Council's charges were 25 to 30 per cent. in excess of the charges of other borough councils. It did not seem right that for the one piece of work they should have to pay higher in the Borough of Westminster than they did in the Borough of Kensington. The 10 per cent. was the last straw. The company had long objected to the charges of this council. Mr. John William Bradley, engineer to the City of Westminster, gave evidence in detail as to the charges of the corporation. He said the expenditure of the council in this department averaged £20,000 per year. They had to employ a staff to supervise the work, which was often done in "bits" at a distance from each other. The case was adjourned.

CHIPS.

Mr. Samuel Thomas Turtle, principal member of the firm of Messrs. Turtle and Appleton, builders and contractors, Wandsworth, died suddenly on Tuesday last at his residence on St. John's Hill, in his 52nd year.

Mr. Frederick L. Olmsted, jun., has been appointed as Professor of Landscape Design in Harvard University.

The London County Council have approved the estimate of £30,500 for the construction of an underground conduit system of electrical tramways along St. John-street and St. John-street-road, Clerkenwell.

The Rochford (Essex) Rural District Council have recognised the services of their surveyor, Mr. H. T. Sidwell, who has acted during the past three years as their engineer in works costing £25,000, by granting him a gratuity of £100.

The fund for the erection of new buildings at Bangor for the University College of North Wales on Saturday stood at £17,794, being augmented by several recent donations. The sum of £200,000 is required.

Earl Egerton, of Tatton, Lord Lieutenant of Cheshire, on Saturday unveiled a bronze statue of Queen Victoria, erected in the Square of Chester Castle as a city and county memorial of her late Majesty. The sculptor is Mr. F. W. Pomeroy, of London. The statue, an erect figure in robes of State, was cast by Messrs. Hollinshead and Burton, at Thames Ditton, and the pedestal, of Darley Dale stone, carved on the four sides with the Royal, county, and city arms, and the rose, shamrock, and thistle respectively, was executed by Messrs. W. Haswell and Son, of Chester.

An improvement was reported in business last week at the Tokenhouse-yard Mart. The public-hall buildings in Pier-avenue, Clacton-on-Sea, comprising a hall and seven freehold shops, producing £510 per annum, sold for £10,250. An island plot of land, measuring 2,546ft. in Southampton-row, was let upon a building lease for 80 years at £620 per annum.

A new church which has been erected in Glasgow-street, Ardrossan, for the E.U. congregation was opened on Friday. The building is capable of seating 500, and it is proposed to erect at a later date a gallery with seating accommodation for 170. The cost has been over £3,000.

Mr. G. F. Watts's equestrian statue, "Physical Energy," which is to be placed in the rocky crevice of the Matopos over the grave of Cecil Rhodes, has been successfully cast in bronze by Signor Parlati at Parson's Green, Fulham, and was on view on Saturday and Sunday. Of colossal size, it represents a nude young rider on a great horse reining in on the ridge of a hilltop. One of the youth's hands is raised to shade his eyes as he gazes into the distance. The horse has been pulled up suddenly, one foot is raised, its nostrils are dilated, and the hind limbs are strained as they grip the slope of the ground. The sculptor has done without the unhappy centre support which many sculptors have thought necessary to a horse in this position.

The London County Council Improvements Committee have settled at £183,150 the claim, amounting to £320,931, of the Metropolitan Electric Supply Company in respect of the cost of erecting and fitting up a new generating station, plant, &c., and of the expenses connected with the taking up, replacing, &c., of the company's mains. The Council is also required by Statute to provide a site, partly freehold and partly leasehold, for the reinstatement of the company's premises.

Our Office Table.

A WRITER in the *Hampshire Independent*, who writes from the Athenæum Club, gives some interesting details of the successive sales, always at enhanced prices, of the carved oak fittings formerly in Winchester College. He tells us that the woodwork when turned out of the chapel the time the so-called "restorations" were undertaken under Mr. Butterfield became the property of the contractor, who sold it for £50 to Old Wykehamist. The latter sold it for £500 Lord Heytesbury, who resold it last year for £700 to a dealer. The original drawings by the basons were then found in the British Museum, and the woodwork, after having been carefully stored, was sold, as recently stated, to Mr. Cooper for £30,000, after having been offered to the authorities at South Kensington, and refused by them. When to be had for the lowest price £5,000, says he tried hard to have it restored in Winchester College; but when he completely failed in this direction he endeavoured to divert his career for another good object, but with equal want of success.

PROFESSOR W. M. FLINDERS PETRIE delivered, on Friday afternoon, at the London University, Imperial Institute-road, the first of a series of lectures on "The Light Thrown on Early Civilisation by Recent Excavations in Egypt, Asia Minor, Babylonia, and Greece." Professor Flinders Petrie devoted his opening discourse to "The Rise of Civilisation in Prehistoric Egypt"; he spoke of that country as the primary source of our knowledge of civilisation in the East, and referred to the great advances made in that knowledge during the last fifty years. The first great step made had been to firmly link the old civilisation of Greece with that of Egypt. It was now possible to show the stages of the Eastern culture up to a period of something like 5,000 years B.C. We were now more familiar with the material civilisation of Egypt and its products in those times than we were with those of any European nation. The course of the rise of the Egyptian kingdom and that of its prehistoric age were far more clearly worked out; and for the first time we were able to trace every link in the chain from a period as far back as 9,000 or 10,000 years down to the present day. Palæolithic man, was, the lecturer said, certainly in Egypt before the Nile came to be in its present condition. Some of the earliest pottery of the Neolithic stage was almost identical with what might be found in Algiers.

AFTER much delay, due to references back on moot points, the City Court of Common Council have at length adopted a series of recommendations from the Streets Committee on the subject of certain by-laws in regard to the demolition of buildings in the City. The committee recommended that the by-laws, as amended, should be approved, and submitted to the Local Government Board for confirmation. It was stated that the regulations provided for the damping of all buildings before demolition, so as to prevent the evolution of clouds of dust, insisted on adequate boardings being erected for the protection of passers-by, and set forth that buildings within 20ft. of the roadway should only be demolished at night, or after three o'clock on Saturdays.

A FURTHER conference, convened by the Camberwell Borough Council, and presided over by the mayor (Mr. Goddard Clarke), has been held at the Camberwell Town-hall to consider the different treatment of the Metropolitan borough councils by the County Council in fixing the amounts of the local and county contributions towards the cost of street improvements carried out in London from March, 1889, to March, 1902. The following resolutions were adopted:—(a) That the present system, whereby the London County Council claims from the Metropolitan Borough Councils contributions on varying bases for similar improvements, is contrary to the practice which should prevail in the Metropolis. (b) That, having regard to the rapid growth of London and the consequent increase in traffic, and to the necessity for some uniform practice being adopted, this conference do now consider upon what principle it is prepared to recommend that the cost of London improvements should be borne. (c) That the principle of treating London as a whole, and of systematically selecting improvements best calculated to provide relief to the main thoroughfares, as advocated by a Select Committee of Parliament in 1871, should at once be formulated by the London County Council in a

definite and comprehensive scheme for all future county improvements, and upon which London should equally contribute upon rateable value.

(d) That in all thoroughfares in which tramways are or may be constructed, a width of not less than 54ft. should be provided, unless the road authority otherwise consent, and the total cost of widening borne by the London County Council, either out of the tramways account or the county rate. (e) That contributions to local authorities for local improvements should be, as far as possible, on a uniform basis.

FOR several years past residents of Yarmouth have carried on a silent crusade of grumbling against the system of watering the roads and streets with salt water. The ladies say that it spoils their dresses, cyclists that it rusts their machines, drivers and owners of vehicles complain about it, and many hold that it is wholly insanitary. That salt water lays the dust more readily than fresh water goes without saying, but it is now open to question whether, of the two evils, more dust is not better than much salt. A similar experience has resulted from the use of sea water at Hastings, where the borough engineer, Mr. P. H. Palmer, finds himself compelled, in an exhaustive report of his experience, to admit that the system has proved a complete failure.

MR. WINGFIELD DIGBY, M.P. has decided that the splendid remains of a Roman villa found on his property at Fifehead Neville, Dorset, shall be covered in, to secure their preservation and prevent injury. It has, however, been resolved that a permanent record shall be taken of the discovery, in the shape of plans and drawings; and this work has been undertaken by the Dorset Field Club, the president of which is Lord Eustace Cecil. When completed they will be placed in the Dorset County Museum at Dorchester. The Rev. C. Engleheart, who superintended the excavation, the whole cost of which was borne by Mr. Digby, regards the remains as among the most important of their kind yet found in England.

AN important concession has recently been made to schools by the Board of Agriculture. Most teachers realise how necessary Ordnance Survey maps are for sound class teaching in local geography, but the price has hitherto been prohibitive. In response to memorials from various sources, the Board of Agriculture has now issued instructions that special editions of the 1in. maps be supplied to educational authorities at the following prices:—200 copies, £1 5s.; 500 copies, £2; 1,000 copies, £3; 5,000 copies, £12. For larger numbers the estimated price would be £2 per 1,000 copies. The only stipulation made is that on no account are the maps to be sold.

THE most interesting object found in the tomb of the Pharaoh Thothmes IV. by Mr. Theodore Davies, who has been excavating in the Valley of the Tombs at Thebes, is the chariot of the dead monarch. The body of it alone is preserved, but in a perfect condition. The wooden frame was first covered with papier mâché made from papyrus, and this again with stucco, which had been carved both inside and out into scenes from the battles fought by the Pharaoh in Syria. The art is of a high order, every detail being exquisitely finished and the faces of Syrians being clearly portraits taken from captives at Thebes. The chariot is, in fact, one of the finest specimens of art that have come down to us from antiquity. Along with the chariot was found the leather gauntlet with which the king protected his hand and wrist when using the bow or reins.

ON Thursday evening in last week, under the auspices of the Carpenters' Company, Dr. A. Wynter Blyth, the medical officer of health for Marylebone, delivered a lecture on "Sanitary Building Construction" at Carpenters' Hall. Mr. Percy Preston, the Master of the Company, occupied the chair. Dr. Blyth briefly glanced at such subjects as the sanitary arrangement of buildings, the water supply, and drainage, devoting the main portion of his address to a consideration of the various methods of ventilation known to the builder, and used by him at the present day. He claimed for ventilation that it was a factor of the utmost importance in our everyday life, and largely affected the vital question of health. The presence of dust in a house, said the doctor, could not fail to be deleterious, for it had much to do with the presence of bacteria in the air. Thus, in a neglected building every cubic foot of atmosphere had been found to contain 2,600 specimens of bacteria, as against 500

in the well-ventilated house. The effect of this from the health and sanitation point of view, it was not difficult to imagine. Warmth, the lecturer pointed out, was one of the best and cheapest methods of ventilating residences. The opening of windows at night was another means of obtaining a pure air supply. The lecturer finally described several well-known patents for securing effective ventilation and pure air.

A LARGE and representative gathering of Flintshire gentlemen was convened at the Queen Hotel, Chester, on Friday, to confer with regard to the application to Parliament during the coming session for powers to construct an electric tramway connecting the districts of Bagillt, Greenfield, Holywell, Halkyn, Northop, Mold, Buckley, Sandicroft, Queensferry, Shotton, and Connah's Quay. The tramway will be worked on the overhead system, and the route, which extends about 30 miles, and serves a district with a population of 34,000, is circular. The cost of the scheme is estimated at £9,600 per mile. It is proposed to erect a generating station in the area, but not if electrical power can be obtained from a generating station which is to be erected by the North-Western Electricity and Power Gas Co., which was incorporated by Act of Parliament during last session.

ON Saturday, Mr. Charles Birchall, C.C., distributed prizes which he gives annually to his tenants in his Hexagon Cottages, Wheatland-lane, Seacombe, for the best results obtained in the cultivation of the gardens attached to and completely surrounding the houses, which are detached, and as the name implies, six-sided, with a central stack of chimneys running through the roof. Mr. Birchall explained that he had for years considered the question of the housing of the working classes. He was convinced that private enterprise would meet the difficulty, and could provide cheap and healthy dwellings with comfortable surroundings at a rent within the means of the working classes. Hence the Hexagon Cottages of Seacombe, which from a sanitary and social aspect could not, he held, be beaten. Such employers as Messrs. Lever Bros., W. P. Hartley, the Cheshire Lioes, the Cadburys, and their own district councils and county council, had shown by their action that slum life spread disaster at the very heart of the community. All the efforts, however, of public men were of little avail unless the working classes themselves co-operated, and, with this object in view, he intended to offer for the future a prize for the best kept and most tidy house, not necessarily the best furnished, but for cleanliness and comfort.

RECENT forest fires in the timber belt of Maine have devastated large tracts of land, hundreds of square miles, which cannot be replaced in many years, and the freshets in the Mississippi have carried away millions of feet of logs, which will never be recovered. A writer in the *Sun* says that more lumber has been destroyed this season by misadventure than manufacturers can cut in a year. These casualties and the natural consumption tend to make commercial timber scarce and high, and those who contemplate building where wood is required are advised to do so immediately, as it will be a long time before it can again be had at present rates. Southern lumbermen who furnish yellow pine are ninety days behind their orders, and the price has been advanced on some grades 2dol. per 1,000ft. The writer above quoted says that forestry is a very slow remedy for renewal of standing wood, for it takes thirty to forty years to grow trees to 24in. diameter, which is the size demanded for boards. The supply of hemlock in the immediate vicinity of this market has been exhausted, and people who require it are compelled to buy 300 miles away. There is practically no wood of this kind left in Pennsylvania, unless it may be in the western part of the State, and when this is cut and consumed it will be necessary to use other varieties. White pine, oak, and cypress have advanced during the year from 6dol. to 14dol. per 1,000ft. The increase in population annually reaches large figures, and the consumption of lumber must keep pace with it; but from the facts quoted there will be a shrinkage instead of a surplus over former years.

SOME suggestive facts on the competition between British and foreign contractors in Egypt are given in the last issue of the *Egyptian Gazette*, with reference to tenders for the extension of the roof of Cairo railway station. Copies of the specifications and plans were sent to 33 well-

known firms, of which there were British eight, Belgian eight, French six, American five, Italian three, German two. The constructors of the roof, Messrs. Dayd' Pillé et Cie., of Paris, were invited to tender, but sent in no offer. No offer came in from America. Only three British firms tendered, and of the remaining eleven offers six were from Belgium. The highest British offer was £16,144; lowest British offer, £12,567; average British offer £14,042. Average time specified for the work, without counting the erection, eight months. Highest Belgian offer, £9,842; lowest Belgian offer £7,715; average Belgian offer, £8,376. Average time specified for the whole work, six months. "Can it be wondered at," asks the *Gazette*, "that the Administration, which, as we know, is not overburdened with wealth, took the lower Belgian offer—viz., that of Messrs. Beaume and Marpon? What can be the explanation of the enormous difference of £4,852 between the lowest British and the lowest Belgian offers? The British work may be a little better, but the Belgian firm is well known, and the difference in the quality of the work can hardly be commensurate with the difference between the offers."

The building trade in Sydney, New South Wales, is just now distinguished by a spirit of more than ordinary activity. In the city, shops and warehouses are being altered and extended. Manufacturers—preparing to profit by the imposition of the new Federal tariff, which will procure a wide home market for local manufactures—have already spent £1,500,000 on the erection of new premises. When the Iron Bonus Bill has been passed by the Commonwealth Parliament, it is expected that another £1,000,000 will go towards the erection and installation of steel mills in the vicinity of Sydney, and on the shores of its harbour.

A REPORT on forests and forest economy in Germany has been made by Dr. Frederick Rose, the British Consul in Stuttgart. Dr. Rose explains the organisation and course of instruction at Eberswalde (in Prussia), Aschaffenburg (in Bavaria), and Karlsruhe (in Baden), as well as the subsequent prospects of the qualified students in the different states, in order to show what forestry as a profession is in Germany. Out of the total of 135 million acres forming the German Empire, about 35 millions consist of forests or forest lands. Rather more than half of this consists of purely forest holdings, the remainder being attached to agricultural holdings. Baden has the largest relative area of forests, the proportion of the whole area of the state being 40 per cent., while in Prussia it is 25, in Bavaria 33, and in Wurtemberg 30 per cent. The oak is chiefly grown on the Lower Rhine and in Westphalia, the beech in Pomerania, the fir in South Germany, the pine on the Central German hills, the Scotch pine on the plains of North-Eastern Germany, while the low-lying lands everywhere grow the elm, ash, beech, oak, and birch. The Scotch pine is the most widely cultivated of any tree, the pine and fir and the beech coming next in extent of area covered. The annual revenue derived from forests in Germany is estimated at 15 to 18 millions sterling. The state of Wurtemberg possesses 1½ millions of acres of forests, the produce of which in 1900 yielded £1,700,000; the cost of production was £500,000, leaving a profit of £1,200,000, or about 16s. an acre. If the taxation be deducted from this, there is a clear profit of 14s. an acre. A steady annual increase has taken place in the value per acre of forest produce since 1860, which amounts in the cases of Prussia, Saxony, and Wurtemberg to as much as 80 per cent.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY.—Architectural Association. Conversazione at Royal Institute of Water Colour Painters, Piccadilly. 5 p.m.

Princess Christian visited Ashbourne on Thursday in last week and opened a new cottage hospital, erected at a cost of nearly £3,000 as a memorial to Queen Victoria.

The General Purposes Committee of the Folkestone Corporation have decided to apply to the Board of Trade for the variation of its tramways order, so as to include powers for the construction of tramways on the overhead system. At the present time the corporation is bound to a conduit or surface contact system, but before it can adopt the overhead principle the sanction of Earl Radnor, which hitherto has been refused, will have to be obtained.

Trade News.

WAGES MOVEMENTS.

THE LABOUR MARKET IN SEPTEMBER.—The monthly memorandum prepared by the Labour Department of the Board of Trade is based on 3,506 returns—viz., 2,187 from employers or their associations, 1,254 from trade unions, and 65 from other sources. It states that employment in September continued to decline. As compared with a year ago there is a considerable falling-off in the general state of employment, and the percentage of unemployed members of trade unions is higher than the mean percentage for September in the past ten years. In the 226 trade unions, with an aggregate membership of 553,508, making returns, 32,179 (or 5.8 per cent.) were reported as unemployed at the end of September, as compared with 5.5 per cent. in August, and 5.0 per cent. in the 221 trade unions, with a membership of 553,870, from which returns were received for September, 1902. The mean percentage of unemployed returned at the end of September during the past decade was 4.5. In the building trade, employment continues moderate, but shows a decline as compared with a year ago. The percentage of unemployed trade union members among carpenters and joiners was 4.0 at the end of September, compared with 2.9 at the end of August, and a 3.3 a year ago. The percentage for plumbers was 6.4 at the end of September, compared with 7.1 at the end of August, and 5.9 a year ago. As to the furnishing and woodworking trades, employment shows a slight decline as compared with August, and is worse than a year ago. The percentage of unemployed trade union members at the end of September was 4.7, as against 4.2 in August, and 3.9 in September, 1902. In the pottery trades employment has improved. In the brick and tile trades it is fair.

The memorial-stone in connection with St. Luke's new Sunday schools at Barrow was laid on Saturday. The schools consist of numerous classrooms with central hall to accommodate 1,000 children.

A new building on the Broadway, Peterborough erected by the city council, at a cost of about £4,000, from the plans of their surveyor, Mr. J. W. Walshaw, carried out by Mr. J. Lucas, and which the county council have now taken over and rechristened the "Peterborough County Technical School," was opened on Monday evening.

The London County Council have voted £7,000 for the erection of a sub-fire-station in the High street of Eltham.

Dr. William Henry Corfield, Hon. A.R.I.B.A. of Savile-row, sanitary adviser to the Office of Works since 1893, vice-president of the Sanitary Institute, and medical officer of health for St. George's, Hanover-square, who died on August 2, last, at Marstrand, Sweden, aged 59 years, has left estate of the gross value of £12,868 8s. 11d., including £5,135 14s. 3d. in net personality.

New Jersey, U.S.A.—Tunnels under Bergen Hill and North (Hudson) River	P., N.J., and N.Y. Railroad Co.	Jacobs and Barringer, 78, Gracechurch-street, E.C.	" 15
London, S.E.—Tunnel Between Rotherhithe and Ratchiff	London County Council	The Engineer's Department, County Hall, Spring Gardens, S.W.	Jan. 19
Cairo—Three Road Bridges over the Nile	Ministry of Public Works	The Com. Int. Branch, Board of Trade, 50, Parliament-street, S.W.	Feb. 1
Ipswich—Extension of Water-Main at Borough Asylum	Corporation	E. Buckham, Borough Surveyor, Town Hall, Ipswich	" 1

FENCING AND WALLS.

Leeds—Boundary Wall	Gas Committee	R. H. Townsley, Gen. Man., Gas Offices, East-parade, Leeds	Oct. 24
Waterloo—Wrought-Iron Railing at Victoria Park	Urban District Council	F. Spencer Yates, A.M.I.C.E., Surveyor, Town Hall, Waterloo	" 24
Gravesend—Unclimbable Corrugated Sheet Iron Fencing	Town Council	C. E. Hatten, Town Clerk, Town Hall, Gravesend	" 24
Portland—Stone Wall and Cast-Iron Railings, Easton-square	Urban District Council	R. Stephenson Henshaw, Eng., Council Offices, New-rd., Portland	" 29
Merthyr Tydfil—Boundary Walls, Penydarren Schools	School Board	J. Llewellyn Smith, Architect, Aberdare	" 29
Tooling, S.W.—Boundary Wall at Grove Hospital	Metropolitan Asylums Board	W. T. Hatch, A.M.I.C.E., M.I.M.E., Embankment, E.C.	Nov. 4
Morpeth—Concrete Retaining Wall	Rural District Council	J. Murray McGregor, Highway Surveyor, Market-place, Morpeth	" 4

FURNITURE AND FITTINGS.

Birkenhead—Poor Law Offices, Argyle-street	Guardians	John Carter, Clerk, 45, Hamilton-square, Birkenhead	Oct. 24
Newport, Isle of Wight—Public Library	Watch Committee	W. V. Gough, Architect, 24, Bridge-street, Bristol	" 24
Accrington—School Chairs (400)	Standing Joint Committee	D. Longton, Wesley School, Abbey-street, Accrington	" 27
Hull—Central Police-Station		J. H. Hirst, City Architect, Town Hall, Hull	" 27
Cardiff—Furniture and Bedding		The Chief Constable's Office, Canton, Cardiff	" 30
Brawdy—Refitting Interior of Trefgarne Owen Chapel		D. Edward Thomas, Architect, Haverfordwest	" 30
Leavesden—Double-Hung Sashes to Asylum Windows	Metropolitan Asylums Board	W. T. Hatch, A.M.I.C.E., M.I.M.E., Embankment, E.C.	Nov. 4

PAINTING.

Darfield—Nine Houses	T. Wilkinson	A. B. Linford, Architect, Carlton Villa, Wombwell	Oct. 26
Bradford—Hospital Pavilion at Workhouse	Guardians	F. Holland, Architect, Hustlergate, Bradford	" 26
Leeds—Holbeck Cemetery	Committee	The City Engineer's Office, Municipal Buildings, Leeds	" 27
Manchester—Assize Courts		J. D. Harker, A.R.I.B.A., 78, King-street, Manchester	" 27
Roundhay, Leeds—Oakwood Bakery		James Charles and Sons, 98, Albion-street, Leeds	" 29

PLUMBING AND GLAZING.

Bradford—Workhouse Hospital Pavilion	Guardians	F. Holland, Architect, Hustlergate, Bradford	Oct. 26
Sowerby Bridge—Fire Brigade Station	Urban District Council	The Surveyor's Office, Town Buildings, Sowerby Bridge	" 28
Warrington—Seven Shower-Baths, Legh-street	Baths Committee	Thos. Longdin, Borough Engineer, Town Hall, Warrington	" 29
Leeds—Workhouse Hospital Extension		Thos. Winn and Sons, Architects, 92, Albion-street, Leeds	Nov. 9

ROADS AND STREETS.

Wallsend—Streets	Corporation	George Hollings, Borough Surveyor's Office, High-street, Wallsend	Oct. 21
Hornsey, N.—Road Works	Urban District Council	E. J. Lovegrove, Engineer, 99, Southwood-lane, Highgate, N.	" 23
Weymouth—Making-up Roads	Melcombe Regis Burial Board	Samuel Jackson, Surveyor, Bridge Chambers, Weymouth	" 26
Manchester—Street Works	Paving Committee	The Surveyor's Office, Town Hall, Manchester	" 26
Sowerby Bridge, Yorks—Levelling, &c.	Urban District Council	The Surveyor's Office, Town's Buildings, Sowerby Bridge	" 27
Salford—Street Works	Corporation	The Borough Engineer's Office, Town Hall, Salford	" 27
Enfield—Making-up River-front	Urban District Council	Richard Collins, Surveyor, Public Offices, Enfield	" 29
Enfield—Making-up Fyfield-road	Urban District Council	Richard Collins, Surveyor, Public Offices, Enfield	" 29
Stockport—Street Works	Highway and Sewers Committee	John Atkinson, A.M.I.C.E., Borough Surveyor, Stockport	" 29
Enfield—Making-up St. Andrew's-road	Urban District Council	Richard Collins, Surveyor, Public Offices, Enfield	" 29
Leeds—Paving and Flagging Streets	City Council	The City Engineer's Office, Municipal Buildings, Leeds	" 31
Romford—Indurated Stone Paving	Urban District Council	J. Turvey, Surveyor, Romford	Nov. 2
Prestwich—Street Improvement Works	Urban District Council	The Surveyor's Office, Chester Bank, Prestwich	" 2
Romford—Laying Granite Setts	Urban District Council	J. Turvey, Surveyor, Romford	" 2
Hastings—Granite Kerb (3,000ft.)	Corporation	P. H. Palmer, M.I.C.E., Borough Engineer, Town Hall, Hastings	" 2
Romford—Limestone Tar Paving	Urban District Council	J. Turvey, Surveyor, Romford	" 2
Tottenham—Making-up Roads	Urban District Council	W. H. Prescott, A.M.I.C.E., 712, High-road, Tottenham	" 3
Godstone—Making-up Salisbury-road	Rural District Council	J. George-Powell, C.E., Godstone	" 4
South Shields—Paving and Making-up New Roads	Rural District Council	J. H. Morton, F.R.I.B.A., 50, King-street, South Shields	" 4
Godstone—Making-up Barfields-road	Rural District Council	J. George-Powell, C.E., Godstone	" 4

SANITARY.

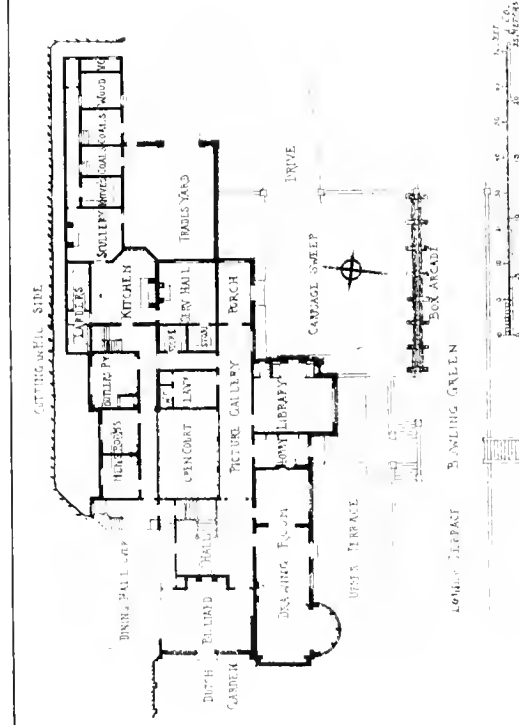

Fulford—Sewers		Farrow and Everist, Surveyors, 8, New-street, York	Oct. 21
Manchester—Sewering, &c., Ashfield-grove	Paving Committee	The Surveyor's Office, Town Hall, Manchester	" 26
Hornsey, N.—Sewer	Urban District Council	E. J. Lovegrove, Engineer, 99, Southwood-lane, Highgate, N.	" 26
Manchester—Sewering, &c., Brookfield-road	Paving Committee	The Surveyor's Office, Town Hall, Manchester	" 26
Woodford, Essex—Sewerage and Sewage-Disposal Works	Urban District Council	William Farrington, A.M.I.C.E., Surveyor, Woodford Green	" 26
Manchester—Sewering, &c., Middlewood-street	Paving Committee	The Surveyor's Office, Town Hall, Manchester	" 26
Mountain Ash—Sewers	Urban District Council	The Surveyor, Town Hall, Mountain Ash	" 27
Canterbury—Cast-Iron Trunk Sewer (1,860yds. of 33in.)	Drainage Committee	The City Engineer's Office, Guildhall-street, Canterbury	" 27
Salford—Reconstructing Sewer, Regent-road	Town Council	L. C. Evans, Town Clerk, Town Hall, Salford	" 28
Poole—Sewers	Rural District Council	John Elford, Borough Surveyor, Poole	" 28
Rotherham—Sewerage Works	Works Committee	F. Platts, Engineer, High-street, Rotherham	" 29
Basingstoke—Sewers	Corporation	F. R. Phipps, A.M.I.C.E., Boro' Sur., Town Hall, Basingstoke	" 29
Ipswich—Public Convenience at Alexandra Park	Urban District Council	E. Buckham, Borough Surveyor, Town Hall, Ipswich	Nov. 3
Tottenham—Underground Convenience, Park-lane	Town Council	W. H. Prescott, A.M.I.C.E., 712, High-road, Tottenham	" 3
Portsmouth—High-Level Relief Sewer	Urban District Council	The Borough Engineer's Office, Town Hall, Portsmouth	" 3
Tottenham—Underground Convenience, Seven Sisters-road	Urban District Council	W. H. Prescott, A.M.I.C.E., 712, High-road, Tottenham	" 3
Tottenham—Underground Convenience, Duckett's-green	Urban District Council	W. H. Prescott, A.M.I.C.E., 712, High-road, Tottenham	" 4
Watford—Sewerage Works	Urban District Council	H. Morten Turner, Clerk, Council Offices, Watford	" 24
Belper—Sewage Outfall Works	Corporation	C. J. Lomax, A.M.I.C.E., Alliance Bldgs., 37, Cross-st., Manchester	" 24
Barrow-in-Furness—Conveniences, Abbey-road	Corporation	The Borough Engineer, Town Hall, Barrow	" 24
Ulverston—Sanitary Work, Steel-street	Corporation	J. W. Grundy and Son, Brodgen-street, Ulverston	" 24
Barrow-in-Furness—Urinal Extension on Walney Promenade	Corporation	The Borough Engineer, Town Hall, Barrow	" 24

STEEL AND IRON.

Torquay—Ventilating Shafts	Town Council	H. A. Garrett, A.M.I.C.E., Town Hall Chambers, Torquay	Oct. 26
London, E.C.—Boiler-Plates, &c.	East Indian Railway Co.	C. W. Young, Secretary, Nicholas-lane, E.C.	" 29
Sowerby Bridge—Steelwork to Fire Station	Urban District Council	The Surveyor's Office, Town Buildings, Sowerby Bridge	" 29
Galway—Cast-Iron Pipes (54 tons)	Urban District Council	Jas. Perry, M.E., M.I.C.E., County Surveyor's Office, Galway	" 29
Swansea—Tramway Rails and Fishplates	Corporation	C. A. L. Prusmann, Borough Electrical Engineer, Strand, Swansea	" 31

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2547.

FRIDAY, OCTOBER 30, 1903.

INTRACTABLE BUILDINGS.

MANY of our recent building problems do not readily lend themselves to architectural treatment; they seem to absolutely defy those principles of design and composition which have been associated with "old world" edifices. One of the earliest instances of this lack of agreement with the older type of building was the erection of structures in which iron is used, for, as every architect knows, this new material completely revolutionised the forms and proportions of buildings of brick and stone. To a large extent we have outlived this apparent discordance; iron and steel are now used in almost every large street and commercial building, and the profession have become familiar with the engineering requirements and the conditions of those materials. But we are not quite so accustomed to other conditions which modern necessities have imposed on our buildings of a certain class—such, for instance, as the large commercial block, the huge block of flats for dwellings or offices, theatres, baths, and wash-houses, and others. These have to be designed to meet the requirements of municipal and local authorities. They must be fire-resisting in their construction, with ample means of access and egress; they must be designed, as in the case of a theatre, on approved lines for sight and sound; be planned and constructed to accommodate a large number of occupants or workers, and be equipped with the latest fittings and mechanical appliances, all of which things mean a departure from old models. Even the street terrace or row of houses cannot be designed on the same lines as those of sixty years ago; they must be built higher, have better accommodation in many ways, and be fitted with the latest appliances in the form of lifts, fire-resisting floors and partitions, and must be built to conform to building by-laws and regulations. The constructional details and methods of decoration have introduced many things that cannot be made to harmonise with the older methods. The London town house of the eighteenth century may be taken as a means of comparison. We find them designed to give all the accommodation on the ground and first floors, the upper floors being reserved for bedrooms and nurseries, and servants' rooms. On these upper rooms the architect bestowed very little thought or attention, as the average old town house shows the upper stories shorn of all architectural details or ornament, with small stair accommodation and without the necessary adjuncts of lavatories or bathrooms. All the skill and taste of the architect were bestowed on the lower reception-rooms of the ground and first floor. These were often well planned for effect, with a spacious hall and staircase. The rooms were large, and were adorned with dadoes, handsome cornices and chimney-pieces, and the joinery, though usually plain, was of the best kind. The ceilings were often panelled or decorated in plaster, and there was a sense of taste and comfort which was denied to the rooms on the upper stories, which were often low, badly arranged, lighted, and ventilated. Many of these older houses, which are still tenanted, have been entirely remodelled or rearranged to meet present-day requirements. The Great Fire does not seem to have prevented the construction of wooden partitions, or the provision of easy means of egress; but the outer walls, and sometimes the main cross walls, were solidly built of brick, which

is more than we can say of middle-class dwelling-houses at the present day under Act of Parliament regulations. Our modern middle-class terrace house of to-day is very different. The reception-rooms on the ground and first floors are less handsome in their construction and fittings, the walls are thinner; but the windows are large, the rooms rather more lofty. The upper stories are, as a rule, better planned, more convenient; there is a bathroom and lavatory accommodation, and the rooms are well lighted and ventilated. These are decided gains, but at the expense of a certain sense of proportion and comfort which we often find in the houses of the last century. The 18th-century house, with all its disadvantages, from a material point of view, could be built to harmonise with architectural rules and proportions. There were no building by-laws or sanitary regulations which forbade the use of massive window-frames brought out nearly to the face of wall, of bold breaks and porches, and deep cornices, often very effective, of timber work in gables. Take again a block of artisans' dwellings or flats. The cost of ground rent requires them to be built of many stories with windows of the same size in every story, and the architect finds it exceedingly difficult to impart any variety or to introduce architectural features. We have only to look at the dismal, monotonous blocks in the Blackfriars-road or Clerkenwell to see what is meant. In the last century houses for the labouring class were not built. Those erected as almshouses were often one or two stories at the most, and built in quadrangles or in groups. The rows of residential flats and houses we see in the western suburbs of London have more or less the monotonous repetition of features, even though partially disguised by a flimsy kind of architectural detail in terracotta. There is the recrudescence of ornamental gables, of corner turrets and bay windows, which tire one by their restlessness, so very different to the fine old terrace houses in Bloomsbury, Grosvenor and Cavendish-squares, the Adelphi, and elsewhere. These were characterised by dignity of style or a chastened simplicity of façade reminding us of the work of Kent or the Brothers Adams. There was something architectural also about the Regent's Park and Belgrave-square type of terrace houses designed chiefly by Nash, Basevi, and Cubitt. The "Cubitt-built" squares and terraces are at least substantial and dignified; but we cannot so call many of those which have been built within the last decade or so at South Kensington, where the modern spirit of restless detail predominates. The commercial warehouse or business house is a comparatively modern structure which cannot be made to conform to architectural treatment. The large areas of floors, the few division walls internally, the large and numerous window openings, their necessary repetition, render it almost impossible to adopt any of the rules of architecture. The attempt to apply architectural rules and proportions or details to those buildings is to make them amenable to criticism of often a not very complimentary kind. Such treatment is generally out of keeping or very ridiculous. The height and proportions of the stories have to be adapted to strictly utilitarian requirements, and to structural methods which defy artistic proprieties, and the architect who values honesty of expression in his work must boldly renounce traditional forms and seek to adopt a new method. In these instances the very attempt to be architectural defeats its own end. There are no precedents; the problem is a new one, to be solved independently of them. Our ancestors would have found out the way to design a large city warehouse if the same problem had been presented to them. The big town hotel is another case. The old inns and hostels were small and limited in comparison, though they

served their purpose well in their day, and were very interesting structures. Modern town life and facilities of travel have rendered the large hotel a necessity of our day. There are no old models to fall back upon, so the architect has to do the best he can on a given site. The problem of providing accommodation for a crowd of single individuals and families, spacious rooms for daily wants, and bedrooms and suites for sleeping, &c., in addition to private suites of rooms, has made it necessary to build palatial buildings comprising many stories. The old parlour and coffee-room of the country inn has developed into the spacious and luxuriously fitted-up *salle-à-manger*, and a variety of other rooms for writing, reading, smoking, billiards, &c., are provided, where all the social festivities of the best society can be carried on with the least friction, combining, as far as possible, the comforts of a private residence with the advantages of a club. To those requirements the architect has to add those of a *cuisine* of exceptional excellence, in which all the latest cooking and culinary appliances are provided. There must also be provided easy transit from floor to floor by means of lifts; an equable warm temperature must be suffused over the interior by means of a heating system, and the ventilation and sanitary arrangements must be above suspicion. These varied and conflicting requirements, so unlike the simple wants of the old-fashioned hotel, have materially increased the thought required to give architectural expression. The great number of stories and rooms has increased the difficulty of fenestration. For instance, the numerous windows, all of about the same size, cannot be arranged satisfactorily, and render any architectural treatment out of the question. A bold order of columns or pilasters appears out of place in a façade crowded with windows, and therefore the astylar treatment is more in keeping with buildings of this kind. Internally, the complexity of the arrangement also renders a reposeful design impossible; everything is cut up by the various trades concerned, and the designs for vestibule or hall decoration, for woodwork, metal-work, electric light fittings are intrusted to different firms. The more complex and intricate the building, the less readily does it adapt itself to architectural treatment. The requirements of fire-resisting construction are also prejudicial to architectural design, as they impose conditions as to floors and roofs, lifts and staircases, which cannot be made architectural in the ordinary sense. The inclosed staircase and lift preclude the possibilities of internal features like open arcing and panelled sides. The modern theatre may be mentioned. The separation of the auditorium from the stage by a fire-wall carried high above the roof is not an arrangement that can be made externally pleasing as we see it in many recent structures;—both have to be treated as distinct structures. Again, the requirements of an auditorium free from columns below the dress-circle, which has to overhang the area considerably, cannot be made to agree with architectural canons. The steel cantilevers to the galleries and the dead blank of ceiling below are distinctly inimical to effect internally, however ingenious the devices adopted. That these constructive expedients may be improved from an architect's point of view we do not deny; but they only show what a difficult problem the modern auditorium has become. Externally the provision of iron fire-escape staircases for exit purposes and for fire-brigade attack, which is strongly advocated, and is made compulsory at Buda Pesth and other foreign cities, adds a feature that must be brought into harmony with the elevations of these structures. As they are now applied externally, it cannot be said they improve the architecture. Public baths and

washhouses and technical institutes are so essentially utilitarian that they can scarcely be considered to come within the range of architecture of the conventional sort; but it is needless to multiply examples of modern buildings which seem to defy considerations of art in their design.

To attempt to find out the reason of the discordance between modern buildings and those which conform to architectural laws would be an inquiry of interest. The old building conformed to architectural standards which have been in existence from time immemorial. It was easy and natural to apply the style of the age to the structure. The style became a sympathetic expression, but the modern types which we have mentioned, based on very different conditions, do not respond to the same treatment. There is little that is responsive between a modern warehouse or a block of dwellings in flats and the Classic or Gothic style; the latter modes became the natural treatment of buildings designed for different purposes, and with quite other materials. It is the architect's business to find out the fundamental cause of the difference, to begin at the rudiments of his new structure—to begin at the beginning instead of trying to hark back to former methods—to invent a method of treatment that will suit his purpose, quite independent of what has been done before for quite different purposes. At all costs, he must avoid the temptation to adopt old forms and conventions because they are convenient modes of expression; and it is always safer for him to begin again to seek out afresh what is in accordance with common-sense construction and honestly expresses it, however simple it may appear, than to try to make his building look like something he has seen before. He must first fully comprehend the problem in its several bearings, what its functions are to be, and the most direct way of carrying them out, the materials at his disposal and their proper treatment, the most reasonable and simple construction, and upon these rudimental bases he must proceed to build. The plainest structure founded upon these principles will be more satisfactory than one where the traditional forms have been adopted. But the advice may be said to be more easily given than followed. How is the architect to fully understand the problem? This is the first step. Unless he has a perfect knowledge of the trade or use of a given building, how can he comprehend it? Or if he has not a practical knowledge of a material like iron or steel, how can he design in it? These are reasonable questions which are not readily answered. He needs a preparation or novitiate; he must be able to put himself into the position of the client or tradesman who intends to build before he can comprehend the functions of the building; so it is necessary for him to put himself in the place of the engineer to realise the practical nature of the iron and steel and their proper treatment and details. As Mr. Arthur T. Bolton, the master of the A.A. Day School, pointed out the other day, "Education is not the acquisition of certain definite information, but the training of the mind to meet contingencies that can never be accurately seen." The very word "education," indeed, as he observes, means the leading out or development of the mind—the discipline and training of, not the exercise of the retentive powers of the mind, and this distinction especially deserves insistence just now in these days of professional examinations. The mental power to think and act should be the chief aim of education, as we have so often pointed out in these pages; but all this ought to be known. Herbert Spencer, Bain, and others have clearly shown the development of the mental processes. It is this need of training, of putting oneself into the position to see as the practical man sees, that is so much required in the teaching of art. The designer needs

to be taught to look on the practical side of his art before he can become a good artist. As the product of the schools, he is now rather a learner of art facts; his mind is stored with models and ideals gained from books and buildings, the results of art classes and schools. So if the modern architect is to become the art-solver of building problems, he must be taught the mental power to deal with these points; that is to say, his mind must be trained and disciplined to meet the difficulties of every new building which he may have to design, and to invent forms or modes of expressing his practical solutions, without any preconceived ideas borrowed from a previous age.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

A FEW years ago we noticed the improvement in the hanging of the pictures at this Society's rooms in Suffolk-street, initiated, we believe, by the President of the Society, Sir T. Wyke Bayliss, F.S.A., and his colleagues. The improvement consisted in reducing the number of pictures, and bringing them down to a convenient distance for sight. Before that period the large, lofty gallery was crowded with indifferent canvases, many were "skied." We must congratulate the President and the committee on a further advance in the decoration of the galleries, which might be followed by other societies with advantage. Having determined upon a convenient sight-line, at a not too great height from floor, the council have carried out a scheme of decoration. The space devoted for hanging has been painted a dark sage green, and this has been crowned by a modelled cornice and frieze decorated with festoons in relief, and picked out in bronze. A low plinth of a lighter bronze has been placed all round to form a skirting. Above the frieze, the wall cornice and cove are left light, and form, as it were, the "sky." The effect is to greatly improve the architectural proportions of the large gallery, and to give a good background to the pictures. The four smaller galleries are treated in the same manner; the friezes are relieved by conventional foliage, modelled, though apparent height is given by the painting of the cornice dark below the cove of skylight. For the carpeted floors polished parquetry of "herring-bone" has been substituted, a more economical and sanitary material.

In the Central Gallery we notice several able works, though the average excellence is rather lower than we have seen it before. Tom Robertson's "Moonrise, Southern Morocco" (2) is a fine study of atmosphere. A sandy stretch of ground, through which a river runs, lined by a few palms, suffused by a sunlight of pale rose, exquisite in its effect of a hot sun. Then we have on the same wall N. Prescott-Davies' "At the Ferry," a young girl clad in diaphanous drapery, a pitcher by her side, waiting presumably for the ferry boat; but the style of the dress and the marble pierhead with its lamp show that it is no ordinary ferry, but a classic conception. The marble seat and alcove are Greek in design. Geo. C. Haite has a fine view of the "City of Tangier," where we see the city with its roofs and terraces bathed in strong light. On the top of one sit a number of groups smoking. Beyond is the green sea. The handling and colour are strong. In the corner hangs a large picture, entitled "An Anxious Moment," by Wright Barker. The scene is a country lane, and in the foreground a farm lad is holding two powerful carthorses, one of which is rearing and about to break away, while the other has his head turned in the other direction. The situation depicted is desperate, and the youth has his work looked out. The restive horse is defiant, and tries to break loose, and the painter has ably

portrayed the movement. The work is full of vigour and the horses are cleverly painted. Robert Morley's "Chateau Gaillard" (21) is a well-known subject well depicted.

Reginald Smith's "Watergate Bay from Porth Island" is a vigorous piece of Cornish coast scenery, strong in colour, and W. J. Laidlay's "Off the South Carr" (29) gives a powerful impression of a stormy sky and sea, with a storm-tossed vessel and broken topmasts. Pleasing in its sentiment and feelingly painted is E. Leslie Badham's "Falling Leaves" (26), a village house and shed and rough field, with lofty trees getting bare of leaves, with the suggestion of autumn in the russet-hued foliage. "A Question of Colour," a young lady in a pink-lined silk dress selecting flowers for her corsage, by W. Hounsom Byles (12); Haynes King's figure study, "While pensive I thought on my love" (19), are clever studies. W. B. Lamond, in his "A Quiet Nook," gives us a pleasing little piece of country—gleams of sunlight through trees. There is a touch of romance in Chas. F. M. Cleverly's "The Devout Lover," a young knight in steel armour clasping the hand of a young maiden who is seated on a bank in a woodland. It is sincere. "A Creek in Peele Harbour," by Fred. Whitehead, must be commended, as well as "Harvesting on the South Coast," by J. F. Darley (35), for its sunlight effect. Robert Morley is a master of animal painting. His "Head of a St. Bernard" (40) is very fine and full of expression in the eyes; and we must also speak approvingly of his "Teazles" (14), "A Highland Shepherd" (157), and his clever portrait group of a lady with her three pet dogs, "A Quartette," in another gallery. Other subjects which deserve praise near the fireplace are S. Grant Rowe's "River Bank," vigorously executed; John M. Macintosh's view, "By Lambourne Stream" (44); J. D. Fergusson's study of a girl's head and hat, "Souvenir of Spring" (45), and over the fireplace Emil Fuchs' clever sketch for the "Portrait of His Majesty the King" (47) in military dress. Val Davis has a charmingly delicate work, "Summer" (50), and Tom Browne one of his clever studies of "A Volendam Girl" (51). "After the Storm," by A. Carruthers Gould, is a charmingly painted seascape, with its grey sea, the waves breaking on a sandy beach and reflecting an evening light. W. B. Lamond's "A Reedy River," and Francis Black's "The Path to the Sea"—a delightful riverscape with trees—are noticeable pictures. Adam E. Precter paints one of the principal figure subjects of the gallery, "The Gift of the Sea" (61), a grey Cornish-looking fishing village, with its steep cobbled street and cottages coming down to the sea. A group of fisherwomen and girls are busy packing the fish, which are plentifully strewn on the beach, into baskets, others in filling barrels with sprats. A large haul of flounders and herrings cover the foreground. The scene is truthful and realistic, the subdued grey light and the glistening fish admirable in effect. Leonard Watts, in "Wild Flowers" (65), paints a bright-haired little girl with poppies in her lap tenderly. Under W. Ayerst Ingram's large blue seascape, "The Isle of Shoals, New Hampshire, U.S.A." (67), is a skillfully modelled figure of a nude girl, "The Dance," by W. Hounsom Byles, painted with scholarly grace and rhythm, and at the corner of room Windsor Fry paints a small allegorical piece, "Eve," in which the golden tresses of the maiden contrasts happily with the green foliage of the trees and their fruit. The president, Sir Wyke Bayliss, gives us one of his noblest and mystic interiors on the "Oriflamme of Milan" (83), rich in colour and excellent in its perspective. Below this work C. F. Lowcock has two bijou studies of classic draped figures, "Pleasant Reflections" (84) and "The Bath" (86), graceful figures of

girls at their toilet. Wynford Dewhurst, in his "Chateau Gaillard," is a pleasing sunlight effect, with the white, lowering, and verdure-clad cliff beyond, with the chateau on its crest, and W. Cave Day's "A Spring Idyll," a child with wild flowers in a wood. One of the principal subject pictures is T. F. M. Sheard's large picture, "A School for Scandal," a group of old women gossips round a tea-table, one of their number is telling a tale which affords great merriment. The expressive faces of the elder women are clever, and as a piece of realism in humble life the subject has great merit. Other subjects of the Hon. Secretary include a portrait of "Mrs. Harry Sowden" (137), and "Summer Spoil" (62). E. A. Fellowes Pryne (96) has a decorative arched panel, "Pan and Syrinx (the Birth of Music)" (96), a well-balanced composition. Amongst other pictures that deserve notice are Paul Paul's "The Road to the Village," through meadows by a river, with village in distance, an evening effect, the light reflected in the river, broad and quiet; Frank Dickson's "Travelling Traders" (100), cottage garden, beyond which a gipsies' caravan is passing; a fine landscape by Frank Spenlove-Spenlove; "The Dusty Road" (107); Hans Trier's fine luminous and hazy view of "Venice"; Walter Fowler's large woodland, "Stirred by the Gentle Breeze of Autumn" (118); "Passing Shadows," by Ivystan Hetherington (119), a landscape in which the sky dominates; and Walter Blundell Thompson's large picture of lions lying on a hilltop (121), called "Still Life"; Hal Hurst's portrait of "Miss Berman" (115) seated on a couch—a fair lady with prepossessing features, in low dress of delicate light fawn and salmon, set off by curtain background—is graceful in pose. No. 105, "The Rain it Raineth Every Day," by John Adamson—a little girl with skipping-rope at her cottage door, surrounded by a Virginia creeper, making a pretty setting to the figure, while the rain is coming down in torrents—is a subject applicable to the present season.

In the South-East and South-West Galleries we must notice the Hon. Secretary's portrait of "Mrs. Harry Sowden," seated, with geraniums and poppies by her side. W. H. Gore's "Contrition," a little girl seated in a room, where she is doing a little penance; and W. Graham Robertson's composition (146), a little boy and girl seated in a garden, very delightful in drawing and delicate in colour. They are indulging in childlike anticipations. Algernon M. Talmage's moonlight scene (138), "When Lingerings Daylight Welcomes Night's Pale Queen," is charmingly true to nature; and we notice some clever sea studies in W. B. Lamond's "Song of the Sea Birds" (136); "Nature's Flying Buttresses, Zorn Point, Falmouth," by Charles Collins, a cavernous rock (140). Philip H. Newman (147) has a large decorative subject over the fireplace, classical in its theme. Geo. C. Haité's large picture, "Queen Victoria's Jubilee, 1897," the procession passing the Clock Tower of Westminster, is an interesting reminiscence (150). Fred Footet's large view of "The Foreign and India Office" (153) is interesting only as a piece of impressionism. With subtle technique the painter endeavours to impart the vibratory effect of sunlight and mist; and a rich jewelled effect is the result. His other picture, "To Morning" (206), shows the effect of dawn and dew in a wood or orchard. As experimental works they have interest. Allan Davidson's graceful figure of a girl in the first step of a dance (155), and Reginald Smith's "Weather-beaten Coast" (161) are also good. Hal Hurst's clever life-size portrait of "Hal," probably the painter's little son (180), dressed in open brown overcoat, white shirt, and scarlet tie, and holding a riding-whip, with top boots, is charming in the delicate grey tones of the wall

of gallery background. Rupert C. Bunny's powerful figure, "The Prodigal Son," in a half-kneeling or crouching position, suffers from its proximity to the last. There are also a few more good pictures, but they are overpowered by commonplace subjects. A large "Nocturne," by A. Moulton Foweraker (195), a large sea piece, "Freshening" (219), by Alex. Maclean, A. Carruthers Gould's "Return of the Fleet" (223), and W. Cave Day's "A Lady in White," may be mentioned as redeeming works. The Water Colour Gallery is perhaps stronger. We notice clever works by Alfred J. Collister, as in "Summer Weather" (240), a village pond, "Shipping" (307), the latter a delightful piece of colour, firm and direct in handling. "A North-country Village," by Arthur Tucker (239), is also strong. "An Errand of Mercy," by Childe Pocock (245), a night scene in a narrow street buried in snowdrifts is pathetic; and there are works by Sylvester Stannard (248-326), E. E. Anderson, as his "Whitby" (268), and drawings by Giffard H. Lenfestey, J. Finnemore, W. Cave Day (288), Paul Brisson, L. Burleigh Bruhl, H. P. Clifford, and W. Harding Smith. A sketch by Tom Browne is full of character, "Volendam Maidens" (329); and there are a few on the screen, as J. W. Schofield's "Vanishing Light" (382). The President has a fine interior drawing, "Old Sanctuary in Bayeux Cathedral" (273), with its beautiful Byzantine capitals; we may also notice P. Fletcher Watson's architectural drawing, "Rue d'Amiette, Rouen" (402). On the whole, the best works, of which there are not a few, suffer from the predominance of works of feeble design and commonplace character.

POPULAR FREE LIBRARY COMPETITION.

FIFTY designs have been sent in for the proposed public library for Bromley, E., and these are on view till to-day at the Council Offices, Poplar. The conditions of the competition required on the ground floor: a lending library, magazine and news rooms, assistants' office, and public and private entrances; on first floor a book store and committee room; and on the second floor rooms for the assistant librarian, with private entrance, besides a basement with lavatory, book store, and heating chamber. These requirements were sketched out in outline by the borough surveyor, Mr. H. Heckford, on the site plan, and we notice most of the competitors have followed the scheme. There designs have been selected by the borough surveyor, who acted as assessor. Design No. 47, by Messrs. Squire, Myers, and Petch, South Kensington, has been placed first, and No. 3, by Mr. A. F. McGregor Milligan, of Liverpool, and No. 39, by Mr. C. Harrold Norton, Bedford-row, W.C., have been placed second. Having so soon to go to press we have only been able to make a hurried inspection of the designs. The design placed first adopts the scheme as proposed by the authorities, which places a lending library between the public and private entrances facing Brunswick-road, and two large rooms, one for magazines and reference, and the other for news room, behind, with a small office for assistant librarian with inspection window between these two, so that they may both, with the lending library in front, be under his supervision. The lending library is 5ft. by 33ft., well lighted by four large circular-headed windows in front, and also by top light on the portion behind, which is kept one story and has an asphalted flat. The entrance lobby and vestibule are of good size, lighted on the south side from an area skylight, the borrowers' lobby projecting into the end of lending library. In the centre, on the inner side is a semi-octagonal room projecting half into the magazine and news rooms for

assistant librarian. At the north end is the assistant librarian's entrance and stairs to his private rooms on top floor, a staff stairs, and book lift, opening to the lending library, also a librarian's room with w.c. and a side area, which gives light and ventilation and at the same time assists to preserve the ancient lights of the houses on each side, a point which some of the authors have neglected. The magazine or reference room, and the news room are each 41ft. by 39ft., top lighted, and also have windows into the back, and on the first floor in front there is a book store with corridor behind and a committee-room. On the second floor, also in front, are the librarian's private rooms, reached by separate stairs. The section shows a well-studied treatment of the reading-rooms behind, with central lantern supported on iron columns, and the front elevation is Classic in character and dignified, mainly of stone. The lending library portion of façade is four bays in length, with engaged Ionic columns between, and standing on the half-sunk basement, and on each side the entrances slightly project, and are carried up as solid masses of masonry, with attic, pierced only by the public entrance on the south side, and by a window on the north. The librarian's dwelling windows are partially obscured by the balustrade. The architectural lines are carried through; the lending-library windows between the columns are circular-headed and wide. The subordinate range of lights divided by small colonnettes above make a pleasing contrast and light the book store and committee-room. The author cubes his design at 11d. and 7½d., the former being put for the front portion, or 9½d. average. The total cost, including heating and ventilation, electric lighting, railings, &c., is £7,500, which is the limit of cost. This plan is compact, and insures control over the departments.

No. 3, placed second, has also a good plan based on the sketch arrangement. The public space for borrowers is rather larger, and is nearly the whole width of lending library, divided by columns from the entrance-lobby on the south side. The lending library is 34ft. by 31ft. 6in., and there is a book store at the other end, the private stairs for librarian's office being placed a little distance from this end. This arrangement is open to question. There is the intermediate supervising office for assistant librarian between the reference and reading rooms behind. The author gets a useful narrow serving-space between the reference library and lending library divided by columns, and in communication with the assistant's central office; but the steps down to this space from lobby are objectionable. The other stories carry out the scheme, and the plan has much merit. The elevation is less successful, though the drawing sent in scarcely does it justice; the projecting entrance on each side of the centre portion, which is set back on first floor, and is adorned by coupled columns and pediments, would be pleasing, but the details are poorly shown. The design is cubed at 9½d. a foot, and the total estimate is £7,497. No. 39, bracketed with No. 3, shows the same general arrangement, but the entrance and borrower's lobby not so well planned. The elevation is Classically treated with flat piers between the windows of lending library. This portion is of two stories, with a story in roof for the librarian's rooms. The corners are rusticated above the entrances and carried up above the central portion. There is a central fleche on main roof, and the general massing is satisfactory, but the drawing is rather rough, and does not do the design credit. There are large octagon lanterns over the reference reading rooms. The estimate is £7,500, and the building is cubed at 10d.

Many other designs show ability. A few of them exhibit a modification of the sketch

plan. In some cases the borrowers' lobby is placed on the inner side of the lending library—without advantage, we think, and certainly less economical; in other plans the building occupies a larger cubic space than the scheme recommends. One or two designs have the assistant librarian's office placed on one side; thereby the supervision of both the magazine and news-rooms is rendered impossible. Side areas are introduced by a few authors to preserve the ancient lights, and one arrangement secures this by placing his main rooms endwise to the front road. No. 5 is a good plan conforming to the surveyor's scheme, and the general arrangement indicates study as to the requirements. Over the centre of lending library a square gallery is shown on the first floor, but the book store is in consequence diminished in size. The magazine and news rooms have circular skylights, and there are good entrances. The elevation is Classically treated and suitable. No. 6, a plain brick treatment, has the board school character, otherwise good. No. 7 has a decidedly artistic treatment on the elevation with high roof—one of the cleverest in the room. No. 46 has also a very artistic elevation, simply grouped with high roof, the entrances carried up as towers with flat cupola terminations. The plan is not so good; there is a large lobby for borrowers. This No. 36 has a Classic exterior, broad in treatment; but the assistant's office is not central, and the newsroom cannot be supervised by this arrangement. No. 30 shows the main rooms running back, lending library on left, and reading room on south side; but the magazine room is a long way behind, and is not easily reached. The centre of front has a lofty, chapel-like end to road between the lending library and reading rooms; the entrances are placed in the centre block. No. 1 is domestic-looking externally; the borrowers' lobby is in the inner side top-lighted. No. 17 has a gabled front, with the object of obtaining the 45° angle for ancient lights; but the effect is doubtful. One design shows the assistant's office taken out of lending library.

THE SOCIETY OF ARCHITECTS.

THE nineteenth annual general meeting of the Society of Architects was held at St. James's Hall, Piccadilly, W., on Thursday evening in last week. Mr. G. Gard Pye, Vice-President, occupied the chair, in the unavoidable absence of the President, Mr. Silvanus Trevail, who was detained by business at Truro. The Chairman mentioned that Mr. Ellis Marsland, the Hon. Secretary, was representing the Society at a mayoral banquet at Salisbury. Mr. C. McArthur Butler, F.S.A.Scot., read the annual report, which was published in our last issue, p. 541. The Chairman, in moving its adoption, referred to its highly satisfactory character, as showing the continued growth and progress of the Society. The increasing support given by architects, especially in the provincial centres, to the Architects' Registration Bill, augured well for the prospects of that measure becoming ere long *in fait accompli*. An important scheme was engaging the attention of the Council, the preparation of a scale of charges to emanate from the Society. The Council also felt that the revised form of building contract issued by the R.I.B.A. was not free from objections, and were considering whether a more equitable form could not be devised. They were also giving attention to the proposed amendment of the law as to ancient lights drafted by the Royal Institute of British Architects and the Surveyors' Institution.

Mr. A. E. PRIDMORE seconded the adoption of the report, which was carried by acclamation.

In reply to a question, the Chairman mentioned that the financial position of the Society was most satisfactory; they had at present a reserve of £700 invested in sound stock, and hoped soon to add another £200 to this balance.

Mr. G. F. Forrest, of the County Surveyor's Office, Wakefield, was elected as a member.

The scrutineers reported the result of the ballot for officers and members of Council. There were

114 ballot papers received, of which eight were rejected as invalid. The following officers were unanimously elected:—President: †Walter W. Thomas, Liverpool. Vice-Presidents: †G. Gard Pye and †A. E. Pridmore, both of London. Honorary Secretary: *Ellis Marsland, London. Hon. Corresponding Secretary: *W. R. Mallett, London. Hon. Treasurer: †H. Goodall Quartermain, Merton. For the twelve seats on the Council there were thirteen nominations, the following being the votes recorded:—†F. W. Chancellor, M.A., Chelmsford, 101; *W. Cooper Hastings, 100; D. Morgan, F.R.I.B.A., Cardiff, 99; R. Frank Vallance, F.R.I.B.A., Mansfield, 99; G. E. Bond, Rochester, 98; Charles Cole, Exeter, 98; *B. R. Tucker, London, 94; *J. W. Dyson, Newcastle-on-Tyne, 93; J. C. Jackson, London, 93; *H. E. Knight, London, 92; *R. G. Bare, London, 91; and *F. W. Macey, London, 85. Not elected, 65 votes. [An asterisk denotes re-election, and a dagger change to a higher office.]

The CHAIRMAN, having invested Mr. Thomas with the presidential badge, the newly-elected President took his seat amid loud applause. In acknowledging his election the President mentioned that he had had some experience of municipal work, having been a member of the Liverpool City Council for the past seventeen years. He should do all in his power to further the progress of the Architects' Registration Bill, a measure which he believed would be in the best interests of the profession and of the public. He trusted that architects would have mutual confidence in each other, eschewing all petty jealousies. He was glad to find on taking office that the financial position was so sound, and it would be his ambition to raise a substantial reserve as a backbone for the body corporate. He hoped to pass on that badge of office to his successor unscathed.

Mr. A. E. PRIDMORE, in accepting the vice-presidency, referred to the projected amendment of the London Building Act of 1894 as demanding the very serious consideration of all architects practising in the Metropolis, and also urged members to use all their personal influence to bear to secure the passing of the Architects' Registration Bill.

Mr. J. R. MANNING proposed a vote of thanks to Mr. Silvanus Trevail for the zeal and energy with which he had discharged the duties of President during the past two years. The motion was seconded by Mr. MEAD, and having been cordially supported by the President, was heartily adopted.

The thanks of the Society were also accorded to the Vice-Presidents, Messrs. Thomas and Pye, to the Hon. Secretary, Mr. Ellis Marsland, to the Secretary, Mr. Butler, and to the retiring members of Council, Messrs. W. R. Bryden, C. Caine, W. L. Grant, and W. J. Jennings, and the proceedings terminated.

COLOUR IN DECORATION.*

By G. H. MORTON.

IMPORTANCE OF COLOUR.

IN a paper that I read before this association at its meeting in Liverpool a few years ago, I said that colour was the "keynote of our craft." It is, undoubtedly, the most important element in decoration, which largely consists in the art of adding colours to a scheme already complete, as regards design and arrangement. The limitation, however, of decoration to colour alone would, of course, be absurd. It must include drawing, design, technical knowledge, and the more practical sides of the craft; but all these seem to me to be secondary to it. An apartment is, as a rule, designed before the decorator begins his work, and if ornament be required, he has an almost unlimited number of designs available in various materials. Consequently, he has not the same necessity to design as he formerly had. Almost all that is required of him is to select the design most fitted to his particular case, taking care that the one determined upon is in accordance with the architectural style of the house and correct in scale, for it is a not uncommon error with these ready-designed materials to use designs utterly out of proportion with the size of the apartment to which they are applied. In the almost unlimited opportunities colour affords the decorator has ample scope, and he cannot give too much study to a subject which will, I think, under any circumstances always remain his chief

* Read at the National Convention of Painters and Decorators at Nottingham.

strength and be a source of so much trouble to those who do not understand it. Most people can appreciate a good colour scheme when completed, thanks perhaps largely to the natural construction of their own eyes; but few are able to work out and attain a really successful result which requires much experience and calculation.

COLOUR IN NATURE.

The usual training of the decorator in the study of colour is, I imagine, to practise the mixture of pigments, try the effects of various combinations in his works, and to study nature. The latter probably receives the least consideration, though nothing, in my opinion, can be of more value than the critical observation of natural effects and natural objects. The harmonies of colours in spring, the fresh bright greens with the primrose and other flowers of the season, the white and grey clouds on the azure sky on a bright summer day in such perfect accord with the yellow cornfields, the deeper tones of autumn, the glorious sunsets, all constitute never-ending subjects for study and contemplation. The more minute observation of the colours of flowers, the relation of their different hues with the colours of surrounding objects, is also most excellent training, and cannot be over-estimated. The contemplation and observation of nature alone, however, is not enough; we must find out the causes of all these effects, and how it is that all nature is so harmonious and so sparing in its use of pure brilliant colour, for the amount of really positive colour is comparatively small. A landscape, for instance, contains far more greys, purples, and neutral tones than bright colours. The artist—I mean the painter of pictures—must realise these effects; but he has, as a rule, his subject before him, and consequently, as regards colour, should have little difficulty. The decorator, on the other hand, has to create his colour scheme; he has nothing before him except in his mind's eye, and it is only by a knowledge of, and regard for, something more than the simple observation of nature that he is enabled to realise his ideas, and bring them to an ultimate and successful issue. Even when a drawing is prepared beforehand it is of little value except as suggestion, for all the colours indicated have to be altered or modified in the actual work, if it is to be successful. To copy the colours exactly would seldom give a satisfactory result.

THREEFOLD CHARACTER OF COLOUR.

To properly understand and appreciate colour it seems to me necessary to recognise its threefold character: light, the construction of the eye, and the colour properties of natural objects. Natural light is the source of all colour. Ample means should therefore be provided for its admission into our rooms, not only because more beautiful colour effects are possible, but because a light room is healthier than a dark one. The compound and complicated nature of white light was first clearly demonstrated by Sir Isaac Newton when he accidentally discovered the "solar spectrum." Professor Tyndall gives an interesting account of this discovery. He said that Newton went to work in this way. Through the closed window-shutter of a room he pierced an orifice, and allowed a thin sunbeam to pass through it. The beam stamped a round white image of the sun on the opposite wall of the room. In the path of this beam Newton placed a prism, expecting to see the image of the sun, after refraction, round. To his astonishment it was drawn out to an image with a length five times its breadth. It was, moreover, no longer white, but divided into bands of different colours. Newton saw immediately that solar light was composite, not simple. His elongated image revealed to him the fact that some of the constituents of the light were more deflected by the prism than others, and he concluded, therefore, that white solar light was a mixture of lights of different colours. All the colours of the spectrum are caused by the different lengthened vibrations of which white light consists, and may be considered primary colours. Hence there can be no such thing as a three-fundamental colour theory in regard to the prismatic colours. As regards colour sensations, however, it is different. The most recent scientific researches and practical experience point distinctly to three principal or primary colour sensations. Colour, as we all know, does not really exist outside ourselves. The different-lengthened vibrations of light could only be regarded as different degrees of light or heat, were it not for the peculiar construction of the eye, which responds to the vibrations of light and

produces sensations we name colour. Of the eye, Helmholtz has said: "If any optician sent him an instrument so full of defects he would be justified in sending it back with the severest censure." With all its defects, however, it has been calculated that the eye can discriminate the addition of the 360th part of white to any particular colour, and, according to Aubert, it can discern not less than two million distinct tints. With one portion only of it are we now concerned, the retina, which consists of ten different layers. One of these divisions, the so-called layer of rods and cones, has the property of appreciating the sensation of light and colour. The rods and cones seem each to have their peculiar function, and though probably both serve as elements of light, it is more especially the function of the rods, whilst the perception of colour is due, possibly exclusively, to the cones. Near the centre of the retina is a yellow spot called after its discoverer, "the yellow spot of Sommering," which is always used in direct vision, and is sensible to all the colours of the spectrum. Proceeding further from this central spot, at first the absence of red appreciation is noticed, then of green, and finally of all colour appreciation. The arrangement of the rods and cones accounts for this. The yellow spot consists exclusively of comparatively long cones close together, and therefore keenly sensitive to all colours. Gradually the rods or elements of light make their appearance as we proceed further from the centre, until they predominate. Here the colour sense becomes less, whilst the sense of light is improved. When the region of colour-blindness is reached the cones appear to have lost their outer limbs, and otherwise degenerated.

PRIMARY COLOUR SENSATIONS.

The rods and cones—or rather the cones—seem to consist of three sets of nerves which respond to certain vibrations of light, and produce the sensations of three fundamental or primary colours. One set, being stimulated by the strongest vibrations, produce the sensation of red. Another set being acted upon by the vibrations of medium length, produce green, and the third set, responding to the short and weak vibrations, produce the sensation of violet. All vibrations, however, may, and probably do, act on the three sets of nerves simultaneously, but those that produce red, green, and violet effect most powerfully the set of nerves designed for their reception. The secondary colours are the result of two sets of nerves being excited simultaneously or in rapid succession. Blue, for instance, is the effect of green and violet, yellow the compound impression of green and red. The intermediate vibrations affect the three sets of nerves in various degrees, and produce compound colours. Upon the three sets of nerves being excited together in their proper relative proportion, white is the consequence.

COLOUR-BLINDNESS.

If this theory of the rods and cones is true, and there is ample evidence that it is, we may assume the existence of a colour sense wherever we find the cones, and to mark it absent wherever they are absent. A defect in their arrangement probably causes colour-blindness. It is well known that colour-blind persons are usually unable to perceive the red rays, though cases occur when they are blind to other colours and keenly sensitive to the red—indeed, the partially colour-blind as a rule appreciate more intensely the colours they are able to perceive than persons possessing the normal sense of colour. The number of colour-blind persons is larger than is commonly supposed. According to Prof. Rood, "It has been estimated that in England about one person in eighteen has an imperfect colour sense." It is remarkable, however, that the affliction is almost exclusively peculiar to the male sex, women being comparatively free from it. Often the colour-blind are for years unconscious of their defect, and it is extremely difficult to demonstrate the fact to them. When we consider the theory of the rods and cones, and are aware that a slight difference in their arrangement causes a proportionate difference of colour perception, and knowing that we are all subject to slight differences, it would appear probable that each individual is affected by the vibrations of light to a different degree, or, in other words, that possibly no two persons see colour exactly alike. The effect of colour differs very much in different persons. I was acquainted with a literary man who, having had his study papered with a bright red paper,

became so irritable and excitable that he could not settle to his work. I suggested a more soothing olive tone, and happiness and good temper were restored to him. Some time ago I was asked by a lady to report on the decoration of her house. She explained that it had been done a few months previously, and that having a great partiality for red, the rooms were mainly that colour, but had faded terribly. I called, and was overcome by the intensity of the scarlet hall—in fact, scarlet everywhere. On my client's appearing I told her that the colour was not fading, but that, owing to her being surrounded by so much red, she was gradually becoming colour-blind to that colour. This rather alarmed her, and resulted in the red being obliterated everywhere, except in the hall, and that considerably dulled. Somewhat analogous was the experience of the observer who, to test the effect of coloured light upon the eye, wore, for several hours, spectacles provided with ruby-coloured glasses, and this prolonged action of the red light on the eye finally to a considerable extent tired out the nerves excited by the red vibrations, so that on removing the spectacles they saw only two colours in the spectrum. Red was not visible, just as in the case of those who are actually colour-blind to that colour. All red objects appeared dull green or brown.

DEVELOPMENT OF THE COLOUR SENSE.

It has been suggested that the colour sense has gradually developed. That some four or five thousand years ago our ancestors were only able to perceive light and shade, and that modern colour-blindness is, as it were, the reversion of this time when all were colour-blind. No doubt the human eye has, through long ages, gradually improved, and, like our other senses, become more refined. We are now able to distinguish and appreciate more subtle harmonies of colour than our forefathers of a more barbarous time, or the savage of to-day, who would probably prefer very crude colours, as he would prefer the beating of the tom-tom to a Beethoven sonata. In ancient literature we find the names of colours unrecorded, and from this fact it has been argued that at an early period the organ of colour was but partially developed. An equally probable explanation is that in ancient times there were few colour terms. Green and blue being so common in nature would naturally at first be unnoticed, and, therefore, the oldest writings first record red and yellow, the more exceptive colours, and it is not till a later time that the names of the more general colours are given. Ignorance of colour terms is often met with at the present time. Many persons are unable to name a colour correctly. It used to be a method of testing colour-blind persons to require them to name a particular colour, and it was often erroneously concluded that those made to do so, or who named it incorrectly, were at least partially colour-blind, when the defect was not in the eye, but simply in not knowing the name of the particular colour. The method, I think, that is now generally adopted is to mix a number of variously-coloured wools, and require the person being tested to sort them out, placing each identical skein together. The mistakes made by the colour-blind are often very remarkable.

COLOUR EFFECTS.

That the eye tires of one colour, though keenly sensitive to another, is well known, and as the weariness increases so also does the ratio of a more intense appreciation of its complementary. The particular nerves most excited are naturally wearied by the effort, while those unaffected are not only able to respond to their particular colour, but in consequence of the action on their wearied fellows, able to appreciate it in a far higher degree. The effect of any colour upon the eye is rendered more vigorous when preceded by its opposite, or complementary colour, more indistinct when accompanied by other similar colours, and more light or dark respectively when in association with deeper or lighter tones of the same hue. Perhaps the most agreeable impressions are when colours are attended or followed by their complementary tints, which, if combined, would produce white or grey, perhaps the least agreeable, and certainly the most detrimental, when one primary colour is viewed for a lengthened period of time. Though no impressions are actually painful of themselves, they may be disagreeable and injurious to the eye. Some authorities hold the opinion that there is no such thing as a colour discord, but I think that there may be quite as much want of harmony in colour

to the trained and refined eye as there is in music to the educated ear. The impression of one colour on the retina seldom if ever occurs; it is generally excited in conjunction with at least a small mingling of the other remaining colours, which together would produce white. We probably therefore never see colours absolutely pure. Were we to do so, they would be so intense as to dazzle the eye by their brilliancy.

HARMONY OF COLOUR.

In all colour combinations it is essential that the different acts of nerves should be excited, so that no one set will be unduly tired and injured. This is what constitutes true harmony of colour. It is absurd to talk of harmonies of red, or any other single colour; there can be no harmony where part of the whole is only concerned. In a discussion that followed a paper I once read on "Colour Harmony," I was taken to task on this point: "How was it," I was asked, "that a yellow cornfield with red poppies was so harmonious?" I replied, "They are not harmonious of themselves, you have forgotten the large expanse of blue sky," which with the yellow and red constitutes an almost perfect harmony, and practically excites all the colour sensations. In this connection it is important to notice that all visible colour be taken into account. A room decorated in reds in which no opposite colours were permitted might be very harmonious in daylight if it had a large window looking on to a green lawn; but at night, when the green was shut out, it would be hot, oppressive, and unharmonious. The colour of artificial light has a marked effect on decoration; as, for instance, greenish glebes in a red room not only neutralise the red, but directly excite the nerves responding to green. Globes of strong colour, especially red, are most objectionable, and might, if long continued, affect the eye and produce partial colour-blindness. The effect of stained-glass is somewhat analogous, for the light in passing through is intercepted and some of its rays destroyed; hence it is not white, but coloured, light that affects the eyes and tinges every object in the room its particular colour. It seems to me essential that where bright colours are employed there should be a proper balance of harmony, so that no one colour will unduly affect the eye. As a rule all coloured glass should be fixed above the eye level, and there should not be too much of it, for the brilliancy of the colours in glass more powerfully affect the eye than the colours in painted decoration. When pale tints are adopted they should be selected with the object of counteracting any excess of one colour in the decoration. Soft yellow tones, for instance, in the upper sashes of a room decorated in violet or purples produce a wonderfully beautiful effect, changing what would be a cold room into a sunny one. A remarkable colour effect is the change of hue colours undergo where lightened or deepened. As a rule white added to a colour produces a bluer hue, or colour deepened assumes a redder hue. Similarly different degrees or intensities of light produce like results. A strong light gives colours a bluer hue, or weak light produces a redder hue. This change of hue is explained by the fact that, light consisting of vibrations of different strengths, the strong reds continue to act after the weaker blues are quenched. The colours with which shadows appear tinted is peculiar. They frequently present the hue of an opposite or complementary colour; thus the shadows on a red wall appear tinted dull green, and those on a yellow wall often present a tolerably distinct purple. As a rule, shadow effects are to the advantage of a colour scheme, and seem to indicate that the eye will have relief somewhere, if not provided by the decorator. In a scheme of one colour, the adopting of different hues of a colour instead of adhering to one seems to me important, and denotes the modern method. It used to be considered very necessary to "match" a colour, so that the same hue would pervade the whole scheme; but now we find that better results are obtained by using what might be called contiguous hues. A red scheme, for instance, is much more pleasing and satisfactory if different hues are placed in juxtaposition, as, for example, reds varying from orange to purple, or a green scheme consisting of bluish and yellowish greens.

HARMONIOUS PROPORTION.

The harmonious proportion of colours has undergone considerable change since Field published his "Chromatic Equivalent." According to it harmony was obtained by the proportion of blue 8, red 5, yellow 3, in their simple form or

however intricately combined. Professor Rood, dividing white light into 1,000 parts, arrives at a very different conclusion. If I am right in reducing his figures so as to correspond with Field's 16 parts, we arrive at something near blue 4, red 4, yellow 8, figures almost the reverse of Field's. I think Professor Rood's result is borne out by experience. We can endure more yellow than either of the other two so-called primary pigments, red or blue. Yellow being a compound colour, sensation also supports it, for yellow, exciting as it does two sets of nerves, red and green, will be less fatiguing to the eye than a colour which excites only one set. The relativeness of colour is well known, and indicates very clearly how impossible it is to judge of the ultimate effect till a scheme is complete. Persons often interfere (decorators know too well) while work is in progress, and thereby often spoil a fine work. Colours change considerably by the association of other colours. Experiments illustrating this chameleon-like property are perhaps the most interesting and profitable that can be made. Chevreul illustrates a large number. Grey on red appears pale green, and on green appears a dull pink. Some blues may be made to appear blue or green; and, in fact, the hues, tones, and shades of every colour may be materially altered by the introduction of adjacent colours. All colours can, therefore, only be judged in their proper positions, and in juxtaposition with the other colours of the scheme. It is, I think, a safe assertion to make that, if a colour scheme is to be satisfactory when complete, it cannot possibly be so when partly done.

CAUSE OF COLOUR IN PIGMENTS.

I have said that all colours are caused by the action of light vibrations on the retina of the eye exciting sensations we name colours. Yet we cannot say that colour is due to this cause alone. Were it not for the power which natural bodies have of selecting their own particular colour the phenomena would be incomplete. No natural body actually creates colour. It simply absorbs a part of the light shed upon it, and rejects the remainder. The portion so rejected, and not that retained, determines the colour. The common explanation is that each object actually changes the light to its special colour; but that this does not occur has been experimentally proved. The coloration of pigments, of flowers, of green leaves, indeed, of all things, is due to this combination of reflection with the phenomena of absorption. Coloured light must be reflected or it would be invisible. All colour pigments are composed of minute particles mixed with a vehicle that has the power of sifting the white light shed upon them, and selecting and destroying certain rays whilst the particles reflect the remainder. The condition of the petals of flowers and of green leaves is just the same. A white lily, for instance, if it were quite smooth, would have the appearance of thin glass. It is, however, composed of a vast quantity of minute cells, so that it resembles finely-powdered glass, from each little particle of which light is reflected backwards and forwards, and there being nothing in the lily to cause the selection of one ray over the other, the light is white. A scarlet geranium is similarly composed; but its particles or cells are infused, as it were, with a colour matter which absorbs or devours all the green and blue rays, and unabsorbed scarlet is reflected. All green leaves owe their colour to the same cause—light passing backwards and forwards through an absorbing colour matter which extinguishes the red rays, and on being reflected back to the eye excites the sensation we call green. The colours of pigments and of all natural bodies are therefore the unabsorbed rays of light shed upon them. Many substances superficially reflecting coloured light prove this to be the case, as many aniline dyes, compressed indigo, &c. Gold, though generally believed to be yellow, is found to be a bluish-green colour when light is passed through a thin layer of it, and perhaps demonstrates as clearly as anything else the phenomena of absorbed and reflected rays of light.

COLOUR COMBINATIONS.

The mixtures of pigments produce very different results, as regards lightness and darkness, to the combinations of coloured lights. Red and green pigment, for instance, when mixed together, produce a dirty-brown colour, due to so much light having been destroyed, for the red pigment absorbs the green and blue rays and the

green absorbs the red rays; consequently, yellow only remains, but is overpowered by so much light having been destroyed. It is almost equivalent to mixing one-third yellow to two-thirds black. The combination of red and green light, however, is almost the reverse. No light is destroyed, but increased, for two lights must be greater than one; hence the yellow produced by red and green light is lighter and brighter than either of these colours singly. The mixtures of colours as constituents of light seem to me to be the true mixtures of colours, and can be easily attained by revolving discs, so made as to partially overlap each other and expose both. Two such discs of different colours when made to revolve rapidly produce a compound colour lighter than either of the colours separately. An instance of the different results obtained by the combination of coloured lights than by pigment mixture was pointed out to me by an artist friend who had travelled in Egypt. He noticed the dome of some building at Cairo, I think, coloured a pale green tone, and wondered how so bright a colour could be obtained in a position where there was no direct light. He got up for a nearer inspection, and found that instead of green the dome was dotted all over with spots of the brightest blue and yellow exposing a white ground. At a distance the colours seem to combine and excite the impression of pale green of a particularly light and beautiful tone, quite impossible to obtain had the same colours been mixed together as pigments in the ordinary way. From my remarks it will be seen that the study of colour is deeper and goes farther than the simple observation of nature. This is amateur's work, and is more or less practised by everyone having an observing eye. It seems to me that more attention should be given to the science of colour, so that we may be the better able to realise our ideas, for I am of opinion that the carrying out a scheme of colour is as much a matter of scientific calculation as of artistic conception. The requirements of the human eye have also to be taken into account, for the eye is a delicate instrument, extremely sensitive to colour, which, if properly used, benefits it; but if badly used, it suffers in consequence. Colour is, therefore, not only an aesthetic gratification or pleasure, but the frequent and continual change from one colour to another is a physical necessity, and worthy the careful study of every decorator who feels that the most important part of his craft is colour.

THE CARE OF A HOUSE.*

THIS is a volume of suggestions to householders, landlords, tenants, and others, who have the care of dwelling-houses, and, though its author hails from Boston, in America, the contents of the work will be found of service to the same class of persons in this country. Mr. T. M. Clark is a Fellow of the American Institute of Architects, and his remarks are, therefore, of practical value to all interested in building houses. The first chapter deals with the construction of a house. He refers to the increasing preference of Americans for independent home life, notwithstanding their habit of dwelling in hotels and apartment-houses, and he says there are few tenants of the latter who do not look forward to the time when they can have a home of their own, an inclination which seems to be inborn in the English-speaking race. The author points out how the independent house can be made structurally sound; how its present defects may be avoided, and the burden of those who inhabit them may be lessened—observations which apply equally to hundreds of our own modern-built buildings. As he says, the source of many of the worries attending housekeeping is unknown to the majority of tenants. They have no knowledge of house construction, of plumbing, heating, and other matters. The author describes the mode of building timber houses so largely seen in North America, and the mode of constructing the frame of studs, usually placed 16in. apart, and covered externally with rough boards and "clapboards" or shingles; and internally with laths and plaster. This construction is well known to our readers, and need not be dwelt on. It may be instructive to learn that the rafters are placed about 20in. to 24in. apart, and are covered with boards and shingles. These distances between studs and rafters are therefore much

greater than with us. No mention is made of trussing; but the partition studs stand on girders or heavy beams supported by brick piers in the basement, and the interior partitions have the studs resting on the floors. Sketches are given of these partitions and floors. The spaces between the joists are used for hot-air pipes, plumbers' pipes, gas-pipes, and electric wires—a source of annoyance and danger. Simple rules are given how to find the direction the boards run, so that they may be removed in cases of leakage of gas, &c. Below joists the plaster of ceiling often shows white lines, while the interspaces are impregnated with smoke and dust, thus indicating the direction of the joists. Structural weaknesses, shrinkage cracks, settlements, are noticed. It is useful to know that cracks generally are at right angles with the direction of settlement. By careful diagnosis, it is not difficult to distinguish cracks due to settlement, shrinkage from those due to bad plaster or want of hair in the mortar. Under the heading of "Roof," the author speaks of coverings, including shingle tiles, which he considers the best of all roofs, hard burnt or brown tiles and slate; the latter is considered inferior to tile roofs, and more exposed to be shaken in high winds. Shingle roofs are more efficient in high winds; but they soon rot in the valleys. Speaking of the pitch of roofs, the minimum recommended is $26\frac{1}{2}$ degrees, or quarter pitch. This applies chiefly to America, a higher pitch is preferred, however. The shingles, tiles, or slates should be put on over two layers of waterproof felt tacked on the boarding. For flat roofs, copper, tin, or composition made of tarred felt in three or four layers, mopped with melted tar and covered with gravel, are used. The remarks on flashings are to the point. Chimneys and fireplaces are often faulty. The stack above roof, if high, is apt to leak, owing to the mortar decaying under the action of rain and frost. An 8in. by 12in. flue is recommended for open fireplaces. Mr. Clark describes the effect of currents of air, its clinging to surfaces over which it passes, so that any obstructive building or hill deflects the current; the suggestions made to remedy down-draughts are sensible. A semi-cylindrical cap of brick or metal, its axis at right-angles with the downward current, is a good preventive. A tapering top is also of value by inducing upward currents of wind which strike it. A good plan of fireplace and section showing a contracted throat to flue just over the fireplace are given here. The sides of fireplace should, of course, be bevelled for radiating heat. When the back is drawn forward to form the "throat" of flue the author says it should form a mere slit about 2in. wide, and just behind a level shelf of brickwork is required to repel downward puffs. The narrow throat prevents cold air entering and checking the ascending gases. These principles are, however, well-known by all practical builders of fireplaces and flues. Useful rules are given for diagnosing the cause of smoky chimneys. The remarks on stoves and furnaces are instructive, and every householder should understand the principles involved, and those are explained. Stoves with iron pipes carried up to the ceiling, controlled by a damper in the smoke flue and slides, are noticed also. "Base burners" and jacketed stoves are described; the latter is an improvement on the ordinary stove, as the iron casing retains the heat and imparts it to the room through grated springs. The kitchen stove and furnaces are discussed in two other chapters, and the next is devoted to "Steam and Hot Water Heating." The author says: "Of both these systems of heating there are two varieties, the direct system by which a radiator, through which the hot water or steam circulates, is placed in the room to be warmed, and the indirect system, by which the radiators are placed in the basement, and serve to heat a current of fresh air which is brought in from the outside, and after warming is conducted to the room to be heated. The obvious advantage of the latter method is that the rooms are not only warmed, but supplied with fresh air; while under the direct system no fresh air is introduced, the radiators serving simply to heat the air already in the room." This distinction is well pointed out, though in practice the two systems are often used together, the larger rooms being warmed on the indirect plan from the basement, while the halls and chambers are heated by radiators in the rooms. The advantages and disadvantages of each system are pointed out; the author prefers the indirect system for the constant supply of fresh air intro-

* The Care of a House. By T. M. CLARK, F.Am.Inst. Architects, &c. With illustrations. London: Macmillan and Co., Ltd.

STOCKPORT NEW INFIRMARY.

duced, and for its less liability to freeze; but it is more expensive; the direct system is cheaper, and more easily managed. Hot-water heating is fully treated, and its conveniences are pointed out; the narrow limits within which a steam radiator can be varied in temperature is one of its drawbacks. With hot water the radiator can be varied to any degree, and it is not necessary to keep up a bright fire through the night. Hot-water heating is also less oppressive than direct steam heating. The difficulties attending the management of both systems are dwelt upon; also ventilation, which is often a source of trouble in both the systems of heating. The evils of imperfect circulation are made the subject of remark; the theory of circulation is explained, and the evil of "traps" for air-bubbles in the pipes without means of escape mentioned. Advice is given on the arrangement of the pipes, the mischief of dips or bends downward, the remedy for "hammering" in steam pipes is clearly pointed out in the "single-pipe" system. Of course, "hammering" is caused by the collision of the steam with the condensed water in the steam pipes; they should be kept apart or made to move in the same direction. We cannot enter into other chapters which treat of plumbing inconveniences and remedies, a long chapter in which much information is given and remedies for troubles suggested. This portion of the volume occupies a large space, and no doubt more than half the troubles of householders and tenants proceed from bad plumbing. The chapter on electrical fixtures, and the remarks on the care of woodwork and keeping a house in repair are worth reading.

An attempt is being made in Leicester to raise £30,000 for the purposes of church extension.

STOCKPORT UNION NEW INFIRMARY.

THE foundation-stone of this large institution was laid a week or two ago at Stockport. The plan and view given to-day show the extent of the buildings, which are being erected from the design of Mr. W. H. Ward, of Birmingham. The site is at Stepping Grove, near Hazel Grove, covering some 26 acres of land. The building contract is a trifle less than £40,000, and it is expected that the total outlay will reach about £50,000, including the furnishing. Cottage homes will be erected for the housing of children, but the old workhouse will be retained as well.

ON BUILDING TIMBERS.—XL.

MEASURING.

IN proceeding to ascertain the solid content of round tapering timber, the nature of the process will be determined by the object to be attained when the measurement and calculations are complete. To measure round timber which shows no regular geometrical figure or cross-section with mathematical accuracy is, as has already been stated, an impossibility; but a very close approximation to the actual content can be obtained by dealing with—say, the trunk of a tree, as if it was actually the geometrical solid to which it approaches most nearly in shape. The content obtained in this way is "actual content," and when the object of the measurement is to obtain the true content, this is the only way of proceeding; but, as the main object sought in measuring round timber is not to obtain the true content, but some figures which, when elaborately juggled with, will give much less than the true content, a different method of calculation must be adopted. The word "content" should be taken to mean

the true content and no other, for "Sale Content," "Content by Hoppus," and content by "Auctioneer's Measure" are not contents at all. They are considerably under the content, and they bear no definite relation to actual content, so that it is not possible to apply a "coefficient of safety" to any of them! A timber merchant naturally likes to buy his round timber by these sham contents, for he gets much more than he pays for; but he would be the first to object to a publican serving him with a quart of ale measured on the same principle—that is by "Hoppus's quarter-girt." It is said as an excuse for this under-measurement that there is much waste in converting a round log, and that when the sapwood is removed the net amount of wood left is really not more than what Hoppus's measurement represents it to be; but this is not true, and even if it were, the timber owner should have the actual contents of his timber stated, together with the percentage allowed the purchaser for waste. An amusing and interesting correspondence on the subject was published in the *Land Agent's Record* for 1887 and 1888. Professor Curtis a practical forester, gave a rule for ascertaining the cubical contents of timber—viz., length multiplied by the square of the average quarter-girt; but a correspondent, who signed himself "A. H.," and who evidently knew what he was writing about, promptly joined issue with the professor, and pointed out the absurdity of the rule, and the errors which must result from its adoption. "It would be a matter of little consequence," writes "A. H.," if the error were in a fixed ratio to the true quantity, as it could then be met by a fixed appreciation of the true price; but the difficulty is that the error increases with the taper of the tree. In fact, the rule applicable to a square prism is erroneously applied to the

frustum of a pyramid. As well might we attempt to cube up a cone by applying the rule for a cylinder. The *reductio ad absurdum* of the rule is "that the top half of the height of a cone equals that of the bottom half!" Subsequently, Mr. Robert Anderson and Mr. Daniel Watney supported "customary measure," with the assistance of three "ingenious" gentlemen, whose "attestations" were cited by Hoppus over 100 years before; but "A. H.," again writing under the nom de plume "X.," manfully stuck to his guns, and routed professors and authorities, after showing the inaccuracy of their rules, and that this inaccuracy was studiously maintained, because it was wholly in the interests of the "trade." "A. H.," who was a mathematician, knew well the only correct way to obtain the content of tapering timber, and he also knew that Hoppus, and all who followed his method, could not obtain that content, and did not want to do so. To take the trouble to show that Hoppus's quarter-girt method is absurd is to flog a dead horse. In "Mullisicium Mensionis, or the Marrow of Measuring," by Venerus Mandey (1698), the following rule is given for finding the content of a conic frustum:—(1) Find the superficial content of the lower end; (2) Find the content of the upper end; (3) multiply one content by the other; (4) extract the square root; (5) add this square root, and the content of both the bases together, all three in one sum; and (6) multiply the last sum by a third part of the length for the solid content required. This is practically the third rule and formula given in the last article. After giving an example carefully worked out according to this rule, Mandey begins a page with "An Advertisement" to this effect:—"The usual way which a great many men use in measuring such a piece of timber or stone, is this, which is a false way, and finds a Content less than the true Content. They take the Sides of the Square about the middle of the Piece, and this Square of the middle of the Piece they suppose to be a mean Square between the greater end and the lesser end; then they multiply the Content of this Square by the Length of the Piece." For round timber it will be only necessary to read "area of the circle" about the middle of the piece, for the "sides of the square," &c. Mandey then calculates the content of a log 20ft. long, 20in. square at the greater end, and 12in. square at the lesser end, by the true way it is 36ft. 3in. 6 parts 8 seconds. Calculated by the usual, but false, way, it produces 35ft. 6in. 8 parts, "which Content is less than the true content by about three-quarters of a Solid Foot, which in measuring of a great quantity of Taper-grown Timber would be considerable."

Writing about the same time, William Hawney, "Philomath," said: "The usual Way to measure round Timber-Trees is to girth them about the middle with a String, and take the fourth Part of that girth for the Side of a Square, by which they measure the Piece of Timber as if it was a Square. But that this is an error, I shall make appear as follows: If the Circumference of a Circle is 1, the Area will be .7958; then the fourth Part of 1 is .25, which squared make .0625; this they take for a mean Area instead of .7958; therefore, the true content always bears such Proportion to the Content found by the aforesaid Customary false Way, as .0625 to .0625; which is nearly as 23 to 18; so that in measuring by that customary false Way, there is above the one-fifth Part lost of what the true content ought to be. This Error, tho' it has been so often confuted, yet it is Grown so Customary in all Places that there is little hopes of my prevailing with men that are so wedded to it to embrace the Truth." Hawney here refers to the measurement of timber which is cylindrical—that is, to logs the ends of which are equal—and he gives an example of how the true, and customary false, contents of a log are ascertained, the latter being in this case 72ft., as against 91.67ft., the true content. Speaking of the measurement of round timber whose bases are unequal, he says:—"The usual way to Measure round Timber (as I said before) is to take a fourth Part of the Girth in the Middle of the Piece for the side of a mean Square. But this way I have prov'd to be erroneous in Timber that is all the Way of equal Thickness, and it must be made more so in Timber that is tapering, and the more tapering it is the greater is the Error. For to the Error in the last Section there is added the Error in the third section; therefore to measure all such Timber according to Art and Truth, such a piece ought to be considered as a Frustum

of a Cone, and should be measur'd accordingly." Hawney's rule for obtaining the solid content of the frustum of a cone is expressed in this way: "To the Rectangle of the Diameters of the two Bases add the squares of the said Diameters, and multiply the same by .7854, the Product will be the Triple of a mean area; while, multiplied by one-third of the perpendicular height, that Product will be the solid Content." This is practically rule No. 1 of last article. He also gives this rule: "To the Rectangle of the greater and lesser Diameters add the third Part of the square of their Difference, and multiply the same by .7854, the Product is a mean Area; which multiplied by the perpendicular height, the Product is the solidity." Stated as a formula, the rule would be like this—

$$D \times d + \frac{(D-d)^2}{3} \times .7854 \times H = S.$$

In the "Builder's Dictionary," by Richard Neve, "Philomath" (1726), the customary way of measuring round timber is stated to be by quarter-girth. The tree is girded about "in the middle of the length, and folding the line twice (to take a quarter of it), they account that for the true side of the square," which of course it is not; "then for the length, it is counted from the Butt end of the Tree so far up as the Tree will hold half a foot girt." The quarter-girth being squared and multiplied by the length the content is not obtained. In measuring oak for sale an inch was always cast out of the square for the bark, that is, "if a tree be 10in. square, they measure him as if he were true 9in.; but for Ash, Elm, and Beech an inch is too much to be allowed for Bark." Neve adds that this way of taking quarter of the circumference for the true square is erroneous, for it always gives the solidity less than the truth by about a fifth part. A very peculiar way of measuring hewn unequal-sided squared timber was common about the end of the 17th century: the width and depth of each piece was taken by caliper measures, these dimensions were added together, and half their sums was taken for the side of the equivalent square, this method of measuring always gave the content more than the truth, and the greater the difference of the sides the greater was the error. Neve says that in his time, though the method of taking the dimensions of square and round timber was erroneous, custom had made them current. John Darling wrote a book on measuring in 1738, called "The Carpenter's Rule Made Easy," and in it he notices the common errors made in measuring timber both square and round. He prefaces his rules for ascertaining the content of timber by explaining the "errors many men, who undertake to measure timber, fall into," these are the "squaring" of rectangular hewn timber by taking half the sum of the unequal sides, and for round timber, taking "girth measure," he makes the following quaint remarks about quarter-girth measure, "I have heard some carpenters say that they did believe there was something more in a round piece of Timber so measured as before. But they say by the time we have paid for squaring of the piece, we find but little profit in buying it round. For all we hew off according to your measuring is a loss of so much timber as we pay for." Darling's rule for finding the content of the frustum of a cone is stated in this way: "To the area of the semi sum of the diameters add one-third of the area of the semi difference of the diameters, multiply the sum by the depth, and you have the content." Here the expression, "Area of the semi sum of the diameters" is incorrect, for the diameters, being lines, can have no areas. Consequently the areas referred to are those of circles having diameters of the dimensions given. A. Fletcher ("Philomath") wrote his "Universal Measurer" in 1776, and he has a tilt at the customary mode of measuring round and square timber. After describing how the quarter-girth is taken, and squared, he says, "this is the method generally practised, because of its ease and expedition; but it always gives the contents too little, so those that buy round timber by this measure have nearly one-fifth part allowed for chips, and more if the timber be tapering." Fletcher points out that if the diameter of a circle is 12in. its area is 113.0976in.; but he does not point out the use of this sum as a divisor for ascertaining the contents of timber, as Mr. Burt (chief measurer at the Surrey Commercial Docks) does in his "Standard Timber Measurer"; probably because custom was so much in favour of erroneous methods it was useless to offer any

other. Hutton's "Mensuration, both in Theory and Practice," published in 1770, gives correct rules for measuring the frustum of a cone, some of which, as they are already given above, need not be repeated here; one, however, that has not been stated may be of use: it is this—

"Multiply .2618 ($\frac{.7854}{3}$) by the height, and

the product by the quotient arising from the division of the difference of the cubes of the diameters by the difference of the diameters." It need scarcely be said that all rules for finding the content of the frustum of a cone are derived from that for finding the content of a pyramid which is the arc of the base multiplied by one third the perpendicular height. Hutton gives a rule for finding the content of round timber "extremely near the truth." It is this: "Multiply the square of one-fifth of the girth by twice the length." He also says: "Multiply the square of the quarter-girth by the length, and the product will be the content, but not near the truth." Referring to these two rules, Hutton says: "The second rule is that which is commonly used, although it differs from the truth about $\frac{1}{5}$ of its content; but the first rule, which is a new one, is about 50 times nearer the truth than the other, it differing from the truth by only 1ft. in 190, and as it is full as easy in practice as the latter, it ought to be brought into general use by measurers of timber, who should certainly prefer the truth to such gross errors as are always introduced by the other method." It is over 150 years since this was written, yet some measurers of timber will still use the quarter-girth method for ascertaining its content; in fact, the "trade" knows of no other method, for timber merchants find it more profitable in every way to use it, as it pays to prefer "gross error" to truth. The absurdity of the quarter-girth, a common method of measuring, is exposed by Hutton in three "Problems," which he states in this way:—(1) To find where a piece of tapering timber must be cut, so that the two parts measured separately shall produce a greater solidity than when cut in any other part, and greater than the whole. (2) To find where a tree must be cut, so that the part next the greater end may measure to the most possible. (3) To cut a tree so as that the part next the greater end may measure to exactly the same quantity as the whole measures to. It is, therefore, possible, to cut off as much as one-third the length of a tapering tree trunk or branch without lessening the cubic content of that trunk; in other words, the content of the whole tree will measure no more than that of the greater part cut off, even though more than one-third of its length has been removed. In the "Young Measurer's Complete Guide," by D. Fenning, 1779, rules are given in a series of dialogues between "Philo, a master," and "Discipulus, a scholar." After Philo gives the correct method for finding the content of round timber, Discipulus observes: "I perceive there is no difficulty in finding the solidity of any piece of round timber, provided the dimensions are given; but I should be glad to know what method is taken by practical measurers to find the circumference." Philo: "The method is very easy, being nothing more than this:—They girth the piece round with a string, double the string twice, and measure it on a rule, by which means they obtain one quarter of the girth, which they consider as the side of a square whose area is equal to the area of the circular base." Discipulus: "But is this method true?" Philo: "No, it is very erroneous; for the fourth part of the circumference of a circle is not equal to the side of a square whose area is equal to the area of the circle." Discipulus: "Why, then, is it practised?" Philo: "It was first introduced by ignorance, and continued because it is somewhat easier than the other, till custom fixed it so firmly that all the demonstration in the world will not be able to banish it from general practice." Philo, however, misses the real reason, which is that under the incorrect method of measuring the merchant pays for 130c.ft. and gets 150c.ft. or more, and as the methods of measuring are practically under the control of the trade, it is not at all likely that purchasers will consent to have a correct content given, when one that is incorrect is profitable to them in every way. Bonycastle's "Mensuration," published in 1787, gives a rule similar to the last referred to by Hutton (given above) for the correct content, and he gives the quarter-girth method as being "according to common practice," showing at the same time by an example that this is

	A	B	C	D	E	F	G
GIRT-----	9'425	8'815	8'206	7'596	6'984	6'371	5'762
QUARTER GIRT	2'356	2'204	2'051	1'899	1'746	1'593	1'440
DIAMETER----	3'000	2'806	2'612	2'418	2'223	2'028	1'834
AREA-----	7'068	6'184	5'358	4'592	3'881	3'230	2'639

"exceedingly erroneous." The only rule given by Dalby in his "Course of Mathematics" (1807) for finding the content of tapering round timber is one for finding the true content—the same, in fact, as Rule 3 in the last article. Gregory revised Hutton's "Mensuration." In the 1829 edition he says of the quarter-girt method:—"This rule, which is commonly used, gives the answer about one-fourth less than the true quantity of the tree, or nearly what the quantity would be after the tree is hewed square in the usual way: so that it seems intended to make an allowance for the squaring of the tree." He points out that curious problems relating to the cutting of timber so as to produce uncommon effects, arise out of the adoption of quarter-girt measurement. These have already been given in referring to Hutton's "Mensuration" published in 1770. Quarter-girt measurement was attacked by Davidson in his "System of Practical Mathematics," published in Edinburgh (1831). After giving the rule he says: "It is obvious that this rule must be very inaccurate in the case of tapering timbers, and even in the case of timber which does not taper; notwithstanding its inaccuracy the rule is universally used in practice. It seems to have been introduced in order to compensate the purchaser of round timber for the waste occasioned by the squaring of it, which must generally be done before it is fit for use. Davies amended "Hutton's Mathematics" by Gregory, and in 1841 the twelfth edition of the book was published. Here the quarter-girt rule is given to find the solidity of round or unsquared timber, so that it has finally become an acknowledged method of finding the content of round timber, even by mathematicians. It is true an explanation is given which accounts for the deficiency in content by saying it is an allowance for squaring the tree. When the trunk of a tree is a frustum of a cone, having its bases parallel to each other, but unlike (they may be ellipses), then none of the rules already given will be applicable, and the following must be used:—To the longest diameter of the greater base add half the longest diameter of the lesser base, and multiply the sum by the shortest diameter of the greater base, and reserve the product. Then to the longest diameter of lesser base add half the longest diameter of the greater base, and multiply the sum by the shortest diameter of the lesser base, and add the product to the former reserved sum, and that sum will be the triple square of a mean diameter which, multiplied by .7854, and that product multiplied by a third part of the height, gives the solid content. The best living authority on timber measuring in this country is Mr. E. A. P. Burt, whose "Standard Timber Measures" every student, surveyor, and timber merchant should have by them for reference in all disputed cases of timber measurement. In the preface to the third edition of his book he says: "The simplicity of Hoppus's tables has enabled them to maintain their ground for more than a hundred years"; and he refers subsequently to the erroneous contents of round timber as given by Hoppus, comparing this measurement with what he calls "Custom House" measurement, which gives the true contents nearly. The outline of an imaginary log of tapering round timber is given in the accompanying sketch. To facilitate calculations, the girt, quarter-girt, diameter, and area at seven places are shown, these dimensions being all in feet and decimal parts of a foot. The lengths are in feet. The contents in feet are found as follows by Rule 1 (last

$$\frac{H}{3} (A + a + \sqrt{A \cdot a}) = \frac{30}{3} (7.068$$

$$+ 2.639 + \sqrt{7.068 \times 2.639}) = 10 (9.707 + 4.319) = 10 \times 14.026 = 140.26 \text{ cube feet. By Rule 2, } H \times .2618 (D^2 + d^2 + Dd) = 30 \times .2618 (3^2 +$$

$1.834^2 + 3 \times 1.834) = 7.854 (9 + 3.363556 + 3 \times 1.834) = 7.854 \times 17.865 = 140.32 \text{ cube feet. By Rule 3, } H \times .02652 (C^2 + c^2 + Cc) = 30 \times .02652 (9.425^2 + 5.762^2 + 9.425 \times 5.762) = .7956 (88.83 + 33.2 + 54.306) = .7956 \times 176.336 = 140.292. It will be seen from these calculations that the contents of the log are 140ft. 3½in. (the decimal parts of a foot vary from 26 to 32, because the decimals have been carried out to a greater extent in some calculations than in others). By these rules section X is found to contain 61'93ft., section Y 45'98ft., and section Z 32'38ft., in all 140ft. 3in. as before. According to Hoppus, section X contains 48ft. 9in. 2pts., section Y 35ft. 11in. 3pts., and section Z 25ft. 0in. 10pts., in all 109ft. 9in. 3pts.; but the singular thing is that the whole log, according to Hoppus, contains only 107ft. 9in. 10pts., or 2ft. less than the three logs of which it is composed, or about 32½ft. less than the true content. Burt's rule is to multiply the square of what he calls the "consistent" quarter-girt in inches, by the length in feet, and divide by 113; applied to the log sketched it works out in this way: consistent quarter-girt 1'899ft. = 22'788in., $22.788^2 = 519.29294$, this multiplied by 30 = 15578.7882, and divided by 113, gives 138'654ft. as the content, which is only 1½ft. under the true content. Hutton's approximate rule given above, the formula for which is$

$$\left(\frac{G}{5}\right)^2 2H = S \text{ (where } G \text{ is the girt) works out}$$

thus: $\left(\frac{7.596}{5}\right)^2 \times 2 \times 30 = 1.519^2 \times 2 \times 30 = 2.307361 \times 2 \times 30 = 138.441 \text{ cube feet, a result almost similar to that obtained by using the Burt 113 divisor. In measuring wainscot oak logs, the sides and crowns of which are straight, multiply the width by the mean depth (at the crown), and this by the length, 50ft. of this measurement is a load. In measuring the length, take up to quarters of feet, and the width and depth to quarters of an inch. The quotient must of course be divided by 114 to bring the contents to cubic feet. When the logs show irregular figures along the sides and humped crowns, as sketches in Articles XXXV., they must be measured in two or more sections, the exact number of which will be determined by the shape of each log. In measuring very irregular wainscot oak logs, the content obtained must necessarily be approximate only, the closeness of that approximation depending entirely on the skill of the measurer. Lathwood is measured by the fathom, a fathom being 6ft. by 6ft. by 6ft., or 216cu.ft. The purchaser should see that the pieces are closely packed; the vendor will, of course, see that they are packed as loosely as possible. A "frame" is usually built to measure lathwood, and a large quantity is described as being so many "frames" or cubic fathoms. The usual sectional forms of lathwood are shown in Article XXXVI. When mahogany logs are of irregular shape or "jagged," the whole length must be subdivided into as many separate parts as its form may demand; the content of the separate pieces added up to one gross sum will give the content of the whole. In measuring logs with defective angles—that is, such as are approximately octagonal, multiply the width by the depth in inches and subtract the square of the base of the defective angle, and multiply the remainder by the length in feet, dividing the product by 12, and 12 for the content in feet. The builder who wishes to find the number of St. Petersburg standards in any parcel of deals had better bring the deals into cubic feet, and divide by 165, the number of feet in a standard; when these areas of the deal-ends in inches are multiplied by the lengths of the deals in feet, divide by 11, 3, 5, 12, and 12. The whole system of correct timber measurement is based on theoretical mensuration; anyone acquainted with it can$

learn in a short time, and without any difficulty, its application in practice. Without a thorough knowledge of the mathematical foundation of the rules for obtaining the contents of surfaces and solids, no one need ever hope to become an expert and accurate timber measurer.

THE END.

PATTERN DESIGN.*

THE practical evolution of repeat in patterning ornament and the planning of decorative forms furnishes a wide and interesting subject for the graphic pen and pencil of Mr. Lewis F. Day, who ranks as one of the most capable and workmanlike ornamentalists of the day. He has, under the title of "Pattern Design," brought out a very attractive handbook for the decorator and student, which supersedes his previous volume, known as "The Anatomy of Patterns." Covering the same ground, and answering the same purpose, the new book is produced on the basis of the old one. Several of the illustrations we seem to remember; but the larger number of designs and diagrams are fresh, bringing the treatise up to date. The principles and the teaching are the same; but as the fashion in form changes, Mr. Day has included some of his later designs. The drawings throughout are excellent, and give as clear a notion of the subjects represented as can be done in black and white without colour. As a rule coloured illustrations in books on ornamental design are very unsatisfactory, and as the patterns have to be given to a reduced scale, the application of chromo-lithography is very misleading unless it is done in an exquisite and very costly way. Any book so produced is thus beyond the means of ordinary learners. We are not complaining, therefore, because colour is not attempted, but it occurs to us that some of the designs thus crisply delineated, as it were in silhouette, present a more harsh and liney effect than they actually would do, or in reality do when rendered in softened gradations, or, better still, in tender contrasts of colour. The chief purpose in view is, however, not so much to illustrate ornamental designs as to show how they are built up and constructed. In this process one of the chief considerations which should be kept in mind is not only the shape and curves of the ornament itself, but the shapes and proportions of the vacant spaces, which in a large number of instances assume more importance in the background than the foliations and forms on which so much ingenuity and time has been expended. In open metalwork design this is of more consequence still. We refer to the subject because in practice many forget its importance and fail accordingly. Mr. Day supplies a great variety of eminently practical advice, showing, too, how to set about producing a design. This is not to be accomplished by idly letting the pencil meander about on a sheet of paper, in the vague hope that something may come of it. To be practical, the designer starts with a notion of some definite sort—a happy thought, an image in his mind perhaps—or, if not that, the idea at least of the sort of thing he wants, the thought of certain lines or masses, or a combination of the two, which promise when repeated to make pattern. Geometric diapers in squares or other rectilinear forms or interlacing circles, diapers based upon scales, double diapers, straight-lined or curvilinear ones, produce almost endless varieties; zigzag lines and interlacing or counterchange arrangements display other developments, all of which come within Mr. Day's work. He also explains the "drop" repeat and the "false" drop, which seem so mysterious to

* Pattern Design. A Book for Students. By LEWIS F. DAY. London: B. T. Batsford. 7s. 6d. net.

the uninitiated. The unpractised in design assume that they have only to repeat at given intervals, no matter what study from nature, and make good the connection between the repetitions of it, and the trick is done. It is not quite so easy as that. Mr. Day shows how and why, thus helping to make the learner's essay as easy as possible by giving the reader the benefit of his own methods and experience. His work is connected with painted, woven, or flat ornament, such as in mosaics and pavings, rather than in architectural enrichment. In this way his work is good, and within the limitations he has adopted. Mr. Batsford, who is responsible for the issue, has spared no endeavour to supplement Mr. Day's care and thought, therefore the book does both author and publisher ample justice. It will be welcomed by many a fellow-worker, and cannot fail to be of much use to the student who is learning to design and draw well. There are nearly 300 illustrations in the volume.

A COMBINATION SAW.

A MACHINE which is in itself almost a complete workshop cannot but commend itself to carpenters, cabinet makers, and woodworkers generally. We have no hesitation, therefore, in directing the attention of readers to the Union No. 5 Combination Rip and Cross-Cut Saw and Attachments. This machine, which is shown in our illustration, has a strong and rigid iron frame,

cold rolled steel shafts, with hand-scraped Babbitt metal-lined boxes, adjustable to take up the wear. The combination wood and iron table-top is 28in. wide by 36in. long; the middle portion (10in. by 36in.) is of iron, planed perfectly true. The table is hinged at the back, and can be adjusted up or down by hand-screw in front for rabbeting, grooving, dadoing, &c. The self-feed ripping device is self-adjusting for all thicknesses of wood, is positive in its action, power being transmitted by gears. The self-feed has three changes of speed. This device is easily detached, leaving the table free for cross-cutting, &c. The extension rolls increase the length of the table to 7ft., making it valuable for cutting long stuff. They can be instantly folded down out of the way when not in use. It is provided with two hand powers, both arranged to allow the operator a natural, upright, and easy position. The hand power (for one or two cranks) at the rear of machine leaves an entirely free table for cross-cutting (any length), dadoing, &c., which we would consider an important feature. The foot power has a powerful walking motion. Power is transmitted entirely by automatic machine-cut gears and chain belts, doing away with slip or lost motion, and runs smoothly. It is claimed that with this machine one man can easily rip soft wood up to 3½in. thick, and hard wood to 2in., doing the work of four men with common handsaws, and that it is equally valuable for cross-cutting, mitring, &c.

The "Union" boring attachment can be adjusted to the machine as quickly as changing a saw. It has an adjustable sliding table and stop to gauge the depth of hole. The steel spindle has a socket for ½in. round straight-shank machine-bits. It is driven entirely by gears, and is powerful in its action.

The "Union" scroll-saw attachment can be quickly placed in position on the machine, making

a strong and serviceable scroll-saw with large capacity. It will cut up to 3in. thick, and swing 24in. It has adjustable saw-clamps, and the wooden arms are mounted on pivot rocker-plates.

The "Union" moulding attachment is designed for edge-moulding, beading, &c., on either straight, curved, or irregular work. The spindle has a vertical adjustment for different thicknesses of work, and is made to rotate in either direction to suit the grain of the wood.

Space prevents us from giving illustrations of the various attachments; but a complete description of the "Union" machine, which will be found valuable to every woodworker, will be found in Catalogue "A" of the Seneca Falls Manufacturing Co., 559, Water-street, Seneca Falls, N.Y., which also describes a complete line of foot, hand, and light power wood-working machinery.

IRISH BUILDING STONES.

DRIFT, GENERALLY.

THE great central plain of Ireland, which has a general level of from 100ft. to 300ft. above the sea, is everywhere bottomed by Carboniferous Limestone. A series of rocks found in England above this limestone, and which represent in time a lapse of several hundred million years, have, at present, no representatives here. Over the whole area of this plain is strewn a mass of drift con-

sisting of clay, in which are imbedded pebbles and boulders, and layers of sand and gravel in regular beds, stratified like the the older formations. This drift rises from the plains up the sides of the hills and mountains to a height of from 2,000ft. to 3,000ft. above the sea-level in many places. The materials of the drift are used for making bricks, mortar, and concrete. As they are not derived directly from any of the solid rocks of the older formations, a short notice of their origin, mode of occurrence, and the natural forces which produced them will be given here, as applying to the whole country generally, and in this way save special reference being made to them under the heading of each separate county. When builders see such materials lying in nearly horizontal and parallel layers in any clay or gravel pit, it seldom occurs to them that they were at one time solid rock, and that they were not "created" clays, sands, and gravels as they are now seen to be. Yet, that it is so is an undoubted fact, and the blocks from which they were derived have—everyone—been quarried, crushed, rolled, sifted, washed, and carried to where they are now found by moving ice and running water. Every particle of limestone, gravel, or sand formed at some time part of a solid bed of limestone rock; every grain of silicious sand was cemented to other grains in a mass of sandstone, and the finest clays were all derived from the waste of granite and other hard rocks. The magnitude of the work done by these natural agents in this pulverising and washing process may be judged from the fact that the well-known Curragh of Kildare, a small patch only of the plain, is a bed of limestone gravel 150ft. thick, derived from the destruction of solid strata which once occupied this same place. As carrying agents ice and water are unequalled. A block of limestone, 140 tons weight, was found in the Coal Measures of Killenalea; one 21ft. by

9ft. by 7ft. rests on Silurian strata near Money-fall at a height of 800ft. above the sea; and one found resting on Old Red Sandstone near Kenmare measured 26ft. by 16ft. by 15ft., and it consequently weighed over 470 tons. Other blocks are found scattered about the country in places where there are no limestone rocks *in situ*. All these have been carried for miles across the country and up the hillsides, and the work can only have been done by water transport. As the whole surface of Ireland, except the top of the highest mountains, was at one time covered with a thick deposit of Drift, and as there are several areas entirely free from it at present, an enormous quantity must have been removed since Ireland last rose from the sea, and this must have been effected by the brooks, streams, and rivers which have been running unceasingly since. A block of Leinster granite 27ft. by 15ft. by 11ft. was found in a field six miles from the nearest granite *in situ*, and on ground 620ft. above the sea; blocks of Galway granite are scattered over the counties of Clare and Limerick, and some are found as far south as Mallow in Cork, a distance of over 100 miles as the crow flies. The largest boulders and blocks are found lying on the drift, and not buried in it. So that ice must have floated them across the sea and dropped them on the drift which lay on the bottom. The largest local accumulation of drift found in Ireland commences at the foot of the hills near Millstreet, in Cork County; it completely covers all the solid rocks for a distance of 20 miles, reaching to Mangerton in Kerry. The whole of this deposit, which is from 100 to 300ft. thick, is a vast rubbish tip, the materials for it having been derived from the hills on the south and west sides. Blocks of granite are found scattered over the basalt of Antrim, and the Antrim hard chalk, with its accompanying flints, is found in the drift of Dublin and Wicklow, and as far south as Ballycotton Bay on the east coast of Cork. When all this work was done, and Ireland submerged, it is not possible to say in terms of A.D., but in geological time it was only yesterday.

Much gravel and sand are dug from Eskers; they are long embankments formed of the water-worn waste of limestone rocks which rise to heights varying from about 20ft. to 150ft. above the level of the surrounding country. The shape of these Eskers is very irregular, and they are of widely different areas in transverse section. The tops are rounded, and the sides sloping or precipitous, or sloping on one side and precipitous on the other. They are characteristic of the Great Central Plain, across which one of them extends for a distance of more than 100 miles, with a base width in section of 500 yards in some places. The Great Southern and Western Railway passes through an Esker a few miles north of Kildare, where the railway company has a ballast siding. The railway passes through the same Esker at the Arden Hills, in the King's County; both cuttings afford admirable sections of this natural embankment. All the Drift deposits described above may be classed as Glacial Boulder clay in two divisions, a Lower and Upper, separated by Inter-glacial beds of sand and gravel; marine, estuarine, lacustrine, and fluvial Drift, and meteoric or blown Drift. During the Glacial Period Ireland was covered with a huge ice sheet over 1,000ft. thick, whose longest flows on the land surface were towards the south-east, prominent centres of dispersion being in Fermanagh, Donegal, Galway, and Kerry, but none in the mountains of Dublin, Wicklow, or Wexford. The direction of the main ice flows is distinctly seen on the hard limestones of the central plain where they are cleared of drift, for here the surface of the rocks is polished, scratched, and striated by fragments of rocks held in the ice which moved slowly over it. The boulder clays, sands, and gravels were all formed by the agency of ice sheets which were forced over the dry land; the erratic blocks were thrown down from icebergs which floated over the land when it was submerged, though some of the smallest may have been moved by ocean currents. The true layers are built up with materials entirely different from those found in the Glacial Beds; they are of much more recent date, and were formed by cross-currents in an Esker sea, when the land was again submerged long after the Glacial Period had closed. In sinking foundations, getting out clay for bricks, digging sand or gravel, or breaking up erratic blocks, the builder will have some idea from the foregoing description, of the nature and

origin of the materials he is dealing with, and of their exact geological sequence.

In the northern counties of Tyrone, Fermanagh, and Cavan pit sand and gravel are obtained from gravel ridges called Eskers; but these are not of marine origin, like the Eskers of the central plain, which are due to conflicting tidal currents; they are evidently of glacial origin, for they are found at levels much above that of the Esker seas, and their contents also point to the same conclusion.

ANTRIM.

The rocks in this county are chalk with flints (275), Upper Greensand, Lower Lias, Rhaetic beds, Keuper marls and sandstones, conglomerates with gypsum, Permian beds, Lower Carboniferous shale with sandstones (279), coal seams and ironstone, Old Red sandstone and conglomerate, Lower Silurian altered rocks, Basalt (340), volcanic ash, and other Igneous rocks. Belfast is built on Alluvium and Keuper marl. Lisburn: Permian sandstone, Caradoc and Bala beds. Ballymoney: Basalt, Alluvium. Ballymena: Basalt. Larne: Lower Lias clay, Keuper marl, Upper greensand, Chalk, Basalt. The most recent rocks in this county—and they cover almost its entire surface—are solid Angitic lavas, which form the columnar basalt seen in the Giant's Causeway, Thane's Hill, near Larne, and along the north and north-east in many places. Denudation has removed a considerable portion of these rocks; but they still attain a maximum thickness of as much as 500ft. in some places. Basalt columns are usually found from 6in. to 18in. diameter, and in lengths of from 5ft. to 150ft. Joints are produced in rocks by the contraction of the masses during consolidation, and the prismatic joints which give rise to the columnar structure of basalt is common to greenstone and felsite; it has also been observed in the gypsum quarries of Montmartre, near Paris. If a block of basalt be melted, and allowed to cool slowly, it will return to its original stony condition; but the mass, instead of being homogeneous, will be found to have a columnar structure, the sides of the columns being hexagonal, and the "beds," flat, concave, or convex, according to the pressure on them. The columns in a mass of basalt are always at right angles to the surfaces of the mass, and in many basalt dykes the columns are separated in the middle, the beds of one set of columns resting on the joints of the opposite set. If basalt is melted and then cooled rapidly, it forms a coarse-looking glass which cannot be distinguished from "obsidian" or the volcanic glass of volcanic districts. The basalt of the Rowley Hills in Staffordshire has been melted in this way and cast into ornaments and mouldings for building purposes; but there is always a danger of such cast blocks weathering badly, on account of the numerous minute cracks which traverse the material in all directions. Underlying the columnar basalt in this county are beds of stratified volcanic ashes, with abundant remains of oak, pine, sequoia, and other trees. The presence of such beds between successive layers of volcanic lava proves incontestably that a lake must have existed here during some period of suspended volcanic activity, and on the bottom of this all these deposits were thrown down. Beds of iron ore, known locally as "bole," are commonly found accompanying the sedimentary deposits. This is a hydrated aluminium bisilicate, in which part of the alumina is replaced by ferrous oxide; it is, in fact, a poor, clayey ore. Limonite, known in the trade as "Belfast aluminous ore," is also found in lenticular bedded masses, on different horizons, in these volcanic rocks; this, and the other true ores are probably decomposition products of masses of trap rock. The sedimentary beds described rest on sheets of basalt and vesicular amygdaloidal trap, about 600ft. thick, the whole of which were erupted into the air from numerous craters scattered all over the county. The lowest series of volcanic rocks, and those which underlie the rocks just described, are the highly silicated and felspathic lavas which were poured out over a much-denuded and water-worn floor of chalk, or older rock where the chalk has been completely removed. There were three distinct periods of volcanic activity in this district, and the marked differences in the materials which form the successive beds of ejected matter, show that a considerable time must have elapsed between each active period. That the whole surface of the land which forms the present county of Antrim should at one time have been covered with molten rock is a startling statement;

yet it is undeniably true, and the exact geological time when this happened can be ascertained with tolerable certainty. It is not at present possible to convert geological time into ordinary time, and one million years are of as little account in geology as one million miles are in astronomy; hence the lava of Antrim was just as solid when the world was created, according to "Revelation," as it is at the present moment. It has been said that the first lava flow was over a floor of chalk; hence it is evident it must have occurred after that chalk was deposited on some sea-bottom, and subsequently upheaved as dry land. In many places an irregular bed of flint gravel, varying from a few inches to over 20ft. thick, is found between the basalt and the chalk, and as this gravel can only have been derived from chalk beds which originally existed here, a considerable lapse of time must be allowed for their removal by atmospheric and other influences. Consequently, the first volcanic outburst here must have taken place long after the deposition of the chalk formation. A key to the age of the basalts is found in the plant remains of the various interstratified leaf-beds, and these would seem to fix the time of the eruptions as later than the "London Clay," and therefore probably in the Miocene Period. If this is so, as there are no stratified rocks of this period in the British Isles, the Continental Miocene sandstones, shales, and limestones are represented here solely by the basalt of Antrim and the West of Scotland. The maximum thickness of all the lava-flows in this district is about 900ft., and the average thickness 545ft.; they cover an area of over 1,000 square miles. The principal basalt or whinstone quarries are: Whitehead, Belfast, Mr. C. W. Cooper (40 men); Whitewell, Belfast, Mr. W. Agnew (18 men); Smith's, Carnmoney Hill (5 men); Tardree, Mr. J. Coulter; Killybegh, Ballymena, Mr. S. Herbison; Glen Farm, Ligoniel, Mr. A. Clements; Drum, Ballymena, Mr. W. J. Meneely; Craighill, Ballyclare, Mr. H. Service; Deer Park, Glenarm, Mr. R. McAllister; Clougher, Bushmills, Arthur Brooks; Bank, Larne, Mr. H. Foster; and Aghalee, Lurgan, Mr. S. McKeon. The basalt is extensively used for road-metalling; the hard varieties are used for building, some of the quarries yielding good blocks of various sizes, which are easily hammered. The tabular, massive, and columnar rocks make good rubble walling, but the stone is usually difficult to work, and its very dark colour, almost black, makes it unsuitable for dressings, but it has sometimes been used for moulded work. A stone called "Tardree granite," which was obtained from a quarry five miles north of Antrim town, is found in nearly every public building in the county; it is "grey, granular, and durable," being really a granitic root of one of the great intrusive lava sheets of the district; it makes good sills, steps, quoins, and other dressings, and weathers well. There are tuffose rocks at Tardree, which look much like those that yield the well-known "Trass" of Germany, both being volcanic products. This trass was extensively used all over Europe and in the British Isles before the introduction of Portland cement, for converting ordinary lime into a hydraulic cement; the Tardree rocks have been tried in this way; but all attempts to convert any of the tuffs into hydraulic cement have hitherto failed. Slensish, Carrick-a-Rede, and Tardree were three important volcanic centres in this district; the Tardree volcano was probably one of the latest active volcanoes in Ireland, the lava from it having forced its way upwards through great thicknesses of overlying basalt. A trace of red elvan, found to the north of Cushendun cuts and polishes well, but the stone is much fractured and blocks of small size only can be obtained sound enough for building purposes. A very handsome bright red elvan is found north-east of Runabay. The columnar basalt of Aghnahot, Portglengone, was much used for building in quoins and copings, and for canal locks, weirs, and bridges, as much as 64,000 yards of rubble, and 78,500c.ft. of dressed stone having been worked in 1859; but this quarry does not now appear in any of the quarry lists of the country. The most recent stratified rock in the county is chalk, or "white limestone," as it is universally called here; it is always found underlying the basalt so fully described above, and chiefly around the edges of this great lava sheet quarries have been opened and are extensively worked to procure stone for making whitening, and for burning lime. This chalk is similar to the upper chalk of Norfolk and Kent

—that is, in its composition and age; but in texture it is wholly different, being hard, compact, and semi-crystalline, breaking with a conchoidal fracture. This change having been produced by the overlying basalts, the Antrim chalk is really a metamorphic rock, whilst the English chalk remains unchanged and as it were deposited as earthy, soft rock, without any tendency whatever to a crystalline structure. It is well known that if chalk, which is nearly pure calcium carbonate, be exposed to intense heat, it becomes decomposed, and parts with its carbon dioxide, the residue being ordinary quicklime; if, however, it is heated under such conditions that its carbon dioxide cannot pass off, the rock will not be decomposed, and when cooled it will be found unaltered chemically, though its texture will be completely changed, being no longer soft and earthy, but hard and crystalline. This is exactly what happened to the Antrim chalk. The successive sheets of molten basalt, which were poured out over it, supplied the heat necessary for calcining and converting the soft rock into lime; but the same covering effectually prevented the escape of any carbon dioxide. Hence the whole of the chalk here has been altered to a hard white limestone, altogether unlike the chalk as originally deposited, though its chemical composition remains unaltered. Owing to extensive erosion, the thickness of the chalk varies considerably; but in some places it is probably about 300ft. The white limestone is full of irregular cracks, and it cannot therefore be obtained in large sound blocks, neither is it suitable for dressings, though it can be, however, dressed and used for rough walling. One of the ablest geologists in Ireland, Professor Kinahan, remarked that "a house built of white limestone with quoins and dressings of black basalt has a clear but quaint appearance," which is certainly true; and he might have added that the contrast of walling and dressings would be startling—one being pure white, and the other almost black! The nearest approach to any work of this kind in England is to be seen at Selborne, in Hampshire, where a house in the square by the church is walled with a white chalky sandstone, the dressings being of red brick. But here the contrast, not being at all violent, is rather pleasing than otherwise, though the general effect is "quaint." The chief quarries in the white limestone are Criggan, Carnlough (145 men), Ballyvaddy, Carnlough (54 men), Fallow Vee (28 men), all worked by the Carnlough Lime Co., Ltd. Wee Park (7 men), Parisha (37 men), Demesne (14 men) Town (29 men), all worked by the Eglinton Limestone Co., Ltd.; Whitehead, Belfast, Mr. C. Cooper (40 men); Magheramorne, Mr. J. Adrian (60 men); Colin Well, Ballycolin, Mr. J. McQuillan (32 men); Whitewell, Belfast, Mr. W. Agnew (18 men); Kilwaghter, Mr. H. Baillie (23 men); Kileoan, Island Magee, Island Magee Limestone Co. (14 men); Rathlin Island, Rathlin Limestone Co. (20 men); Gleno, Larne, Messrs. Crawford (12 men). There are several other quarries, but they give employment to only 10 men and under. Lias beds are seen below the white limestone from the south of Colin Glen to White Head on the north side of the entrance to Belfast Lough. They are also found on the east coast of Island Magee, at Larne, Glenarm, Ballintoy, White Park Bay, and Portrush. At the latter place the Lias rocks are altered into hornstone where they are associated with volcanic rocks known as "Elvans." The Upper Greensand only is found in Antrim, where it forms the lower beds of the Cretaceous rocks, no representative of the walden beds. Lower greensand or Gault of England have been discovered in Ireland. Here the Upper Greensand is like the English rock, a soft, sandy chalk of greenish colour, the latter being due to the presence of small grains of silicate of iron. At Larne, where the rock is well exposed, the colour is red, but the prevailing colours are light and dark green. At Collin Glen, and at Waterloo near Larne, the greensand is from 10 to 20ft. thick; it does not furnish any building stone. The Lias rocks of Antrim afford no building stones. The clays may have furnished the material out of which the rude pottery was made which is found in the kitchen middens on the north coast. Rhaetic or Penarth beds are seen in Collin Glen, south-west of Belfast, where, as in England, they appear to be passage beds between New Red Sandstones and the Lias; their greatest thickness here is about 19ft., and they consist of dark coloured shales and limestones resting on shale clays and thin sandstones. Good sections of the rocks can

be seen along the coast near Larne, Glenarm, and Garron Point, where they are over 100ft. thick; they yield no building stones. Upper Bunter Sandstone, Lower Keuper Sandstone, and Keuper Marls form a long strip of Triassic rocks in the Lagan Valley. There is a continuous exposure of similar strata along the coast from Belfast to Ballycastle; in fact the beds generally are found encircling the great basaltic plateau, and in the lower grounds of river valleys, the outcrop being more in the nature of narrow bands than any great area of surface exposure. Near Carrickfergus the beds contain rocksalt, some of them being 88ft. thick, 95 per cent. of the rock being pure salt. Here the Lower Keuper Sandstones underlie the Salt Measures, and the thickness of the whole series of Triassic beds is estimated to be not less than 2,000ft. Gypsum has been found in the Keuper Marls of the Forth, Woodburn, and Lagan valleys; but none of the veins are thick enough to pay for working. The workmen call the New Red Sandstone of the north of Ireland "Red Free," and it may be said of it that even the best stone is very friable, and if it works freely it also weathers freely, so that although Belfast is built on the rock it imports its building sandstones from the adjoining county of Down, from Dumfries in Scotland, and from England. The "Red Free" changes colour on being exposed to the weather for a time, and it is therefore in this respect very unreliable. There are unimportant quarries at Red Bay, Bank Head, Newhaven, and along the Lagan Valley. The red marls of the Keuper division have been cut through by the railway from Carrickfergus to Larne, where they may be seen banded with irregular beds of gypsum. The Permian sandstones and magnesia limestones of England are represented in Ulster by a small exposure of brownish yellow magnesia limestone, which is seen resting as on red marls east of Cultra Pier, on the south shore of Belfast Lough, and in the Lagan valley, south-east of Moira, similar beds are found; but they yield no building stones anywhere in Ireland, and were formerly quarried solely for conversion into Epsom salts. Permian beds have not been identified with certainty in Antrim; but it must be recollected they are intimately connected with the Triassic rocks, and are only to be distinguished from them by their fossils. Lower Carboniferous rocks are worked in the Ballycastle coalfield for coals and sandstones. Though commonly called "Coal Measures," the strata really are a portion only of the Calp division of the Lower Carboniferous Limestone. The Calp of Ulster is similar to the English Coal Measures, but the rocks are on totally different geological horizons, and should not be confounded together. The principal quarry in the sandstones of the Ballycastle coalfield is that at Ballyvoy, and it is a celebrated one, or, rather, it was at one time celebrated, for at present the proprietor (Mr. H. M. McGildowney) works it with only three men. The quarry produces stone of two colours—pink and cream; a coarse-grained variety of the latter is strong and well suited for bridges, piers, and other weight-carrying work. It has been extensively used in the county; the Glendun Viaduct, where this stone has been built into all the more-exposed parts for dressings, shows no signs of decay. It is said that the finer stone can be edge-bedded without risk of failure; it works to a sharp arris, and is well suited for fine work. Other places in which this stone has been successfully used are Dover Hill, Londonderry, facings and dressings, 1785; spire of the Charitable Institute, Belfast, 1774; the portico of St. George's Church, Belfast, which was removed to this building from Lord Bristol's Palace at Ballyscullin. It was formerly used for tombstones, but Scotch and English sandstones have displaced it, though they are not anything like as good weather stones. One of the weaknesses of the Irish character is that anything brought from England or Scotland is much preferred to what is produced in Ireland, though the latter may be better suited in every way for the purpose in hand; hence Irishmen will persist in neglecting first-class building stones which may be quarried at their own doors, and import comparatively worthless soft stone from across the seas. Like almost every other building stone, that from the Ballyvoy quarry needs selection, for some of the fine-ground varieties are friable, whilst others are irregular in texture and iron spotted. The Old Red Sandstone is included with the Lower Carboniferous rocks of Ireland by Professor Kinahan, because in no place in Ireland

has it a defined upper boundary, the sandstones graduating into the Carboniferous beds. The Silurian sandstones and conglomerates of Cushendun have been quarried at Cavehouse for building in Belfast. The conglomerates can be raised in blocks suitable for heavy work, the finer sandstones being suitable for dressings. Though formerly much worked, these beds are now wholly neglected. Metamorphic rocks of Ordovician or Arenig Age occupy a considerable tract in the Ballycastle coalfield; but as they are hard grit and quartzite, none of them are suitable for dressed work, though they make good walling. Lime made from the white limestone of Antrim usually sells for 15s. per ton. The stone in its raw state is worth about 3s. 6d. per ton. The basalt is shipped to England. Crushed for macadam, it is worth 5s. 6d. on board vessels in Ireland, and about 10s. per ton in England. There are no less than 755 quarries shown on the Ordnance Maps of this county. At present only 58 are in work which exceed 20ft. in depth; this brings them under Government inspection.

BOOKS RECEIVED.

Saint Albans: the Cathedral and See. (London: George Bell and Sons). The latest volume in this excellent series of cathedral handbooks is a history of the Benedictine abbey church, since 1877 known as a cathedral, of St. Albans, by the Rev. THOMAS PERKINS, of Turnworth, who is also the author of the companion volumes on Manchester, Wimborne, Bath, Rouen, and Amiens. The reader naturally turns at once to see what view the writer takes of Lord Grimthorpe's reconstructions and new work; and general concurrence may be expressed in the tone of the criticisms. The new west front, although mildly described as "not altogether satisfactory" and "as good as most 19th-century work," is pronounced to be greatly superior in design to the work of the great Parliamentary counsel and clockmaker in the south and north transepts, where the feeble attempts at original treatment are justly condemned. Passing on to describe the highly-interesting older work, the length of the ritual nave, the flatness of the roofs, the fine vertical proportions of the elevations, and the massiveness of the arcades are pointed out in the western limb. The works of restoration carried out for Lord Grimthorpe in the Lady-chapel, and for Lord Aldenham (by Mr. Harry Hems) in the high altar screen, are spoken of with unqualified approval. The handbook will be found invaluable by those visiting or reading up the history of St. Albans, and is illustrated by fifty reproductions of photographs, some showing the condition of the building prior to the rebuildings of a quarter of a century since.

The formal reopening of the Lichfield Corn Exchange took place last week. The Exchange was founded and maintained for many years by a company, but some time ago it was acquired by the Corporation at a cost of £1,050. Some £300 additional has been spent on improvements and repairs.

The question of the erection of a new orphanage, which has been before the Primitive Methodist Connexion for some years, is approaching a practical settlement. The special committee intrusted by the Conference with the matter has had under consideration 41 sites recommended by the respective district authorities, and has decided in favour of one at Harrogate containing nearly eleven acres. The general committee at its last meeting approved of the site recommended, and authorised its purchase for £5,500.

In the case of the application for an order of discharge from bankruptcy made on behalf of Joseph William Elliott (described in the receiving order as Joseph N. Elliott), lately Bush Hill Park, Enfield, now Beddington, Surrey, builder, lately trading with John Hyne as Elliott and Hyne, the discharge has been suspended for two years, ending Sept. 14, 1905. In that on behalf of William Maxwell Gordon, Liverpool, timber merchant, discharge is to be suspended until a dividend of not less than 10s. in the pound has been paid.

It has been decided to erect a South African war memorial in Morrab Gardens, Penzance, and sketches have been prepared by Mr. Oliver Caldwell, F.R.I.B.A.

Good progress is being made with the extension of the county lunatic asylum at Bracebridge, near Lincoln, which will cost about £90,000. The contractors are Messrs. W. Brown and Sons, who have already received over £31,000 on account of the contract.

OBITUARY.

WE regret to hear that Mr. JAMES MARTIN BROOKS, A.R.I.B.A., of Orchard Cottage, Ashford, Middlesex, and 35, Wellington-street, Strand, eldest son of the late James Brooks, died on Saturday at his residence, aged 50 years. Mr. Brooks, who joined the R.I.B.A. as an Associate in 1881, has only survived his father, the well-known ecclesiastical architect and Royal Gold Medallist, by just two years. Mr. Martin Brooks was articled to his father, and joined him in partnership in 1886, Mr. G. H. Godsell being admitted as a member of the firm in July, 1901, and Mr. Groome at a more recent date. Among recent works carried out by the firm are the chapel at Tenbridge School, the churches of St. Peter, Hornsey, and St. Luke, Enfield. Mr. Brooks has left a widow and three children. The funeral took place at Ashford parish church on Tuesday afternoon.

MR. ERNEST BENNETT SINCLAIR SHEPHERD, M.A., who only a few months ago obtained an appointment on the Archaeological Survey Department of India, and late of Warwick-square, Kensington, died at Simla on Thursday, the 22nd inst., at the early age of 31 years. He was the elder son of the late Rev. F. Shepherd, and had practised as an architect, having been for several years a member of the London Architectural Association. He had for several years rendered valued help as president of an architectural and archaeological section at Morley College, and also of a similar club at the Borough Polytechnic, and frequently lectured on Medieval monuments and costumes, and kindred topics.

ALL lovers of old silver plate will regret the death of Mr. WILFRED JOSEPH CRIPPS, C.B., F.S.A., which occurred on Monday at Cirencester, at the age of 62. His chief publications were "Old English Plate" (1878), "Old French Plate" (1880), and "Corporation and College Plate" (1881). The result of the issue of these works, based on the researches of older collectors, including the late Octavius Morgan and the late Sir Augustus Franks, was to stimulate an interest in the ancient silver in the possession of churches and public bodies throughout the country, and to raise to an unexpected extent all well authenticated pieces of plate that came into the market. The great value of Mr. Cripps's books is that they form an authoritative guide to dates, places, and makers. Mr. Cripps was created a C.B. in 1889.

CHIPS.

There has just been erected in the parish church, Cortachy, N.B., a tablet of white Sicilian marble to the memory of the late Earl of Airlie, who fell at the head of his regiment, the 12th Royal Lancers, at Diamond Hill, South Africa, on June 11, 1900. An inscription to this effect is placed on the tablet.

The work of the Archbishop of Canterbury in his former diocese of Winchester is to be commemorated by the addition of his portrait to those of his predecessors which are hung in Farnham Castle. The subscription list having now been closed, the executive committee have commissioned Mr. Arthur Cope, A.R.A., to paint the portrait.

A new church of St. Peter, Wilfracombe, is approaching completion, and will be consecrated before the end of the year. It is being built at a cost of £6,000, from plans by Mr. G. H. Fellowes Prynne, F.R.I.B.A., of London. At some future date a tower is to be added.

Colonel Legard, of Welham Hall, is having a stained-glass window placed in the new church of St. Peter, Norton, Malton, in memory of the local men who went out to the Boer war. The window is to be shortly unveiled by the Bishop of Hull.

Mr. Ashton Bremner, of Oswestry, has been elected borough electrical engineer to the Burslem Town Council.

The Local Government Board have given their sanction to the application of the Seisdon Rural District Council for authority to borrow £14,000 to meet the expenditure involved in carrying out a system of sewage disposal for the township of Upper Penn. The site of the proposed works will be at Merry Hill, where the council has purchased 23 acres of land for £1,131. The sewage will be treated on the gravitation system, with septic tanks and continuous filters.

The foundation-stone of a new church was laid on Saturday afternoon in Timbercroft-lane, Plumstead. It is called the "Church of the Ascension." The architect is Mr. A. E. Habershon, and the builders are Messrs. Dorey and Co., of Brentford. The cost of the present section will be £2,500.

BLACKPOOL TECHNICAL SCHOOL.—FIRST PREMIATED DESIGN FOR TRAMWAY OFFICES, LIVERPOOL.—ST. ANDREW'S CHURCH, MUSWELL HILL.—A COUNTRY HOUSE.—MARYHILL LIBRARY, GLASGOW.—COTTAGES AT COOKHAM.—WOOD BRIDGE AT LUCERNE.—TRIUMPHAL ARCH AT VICENZA.—ATTRIBUTED TO PALLADIO.

Our Illustrations.

BLACKPOOL TECHNICAL SCHOOL: SELECTED DESIGN.

MESSRS. POTTS, SON, AND HENNINGS' design, which we illustrate to-day, was awarded the first premium in the recent competition held at Blackpool for this building. The plans and elevations explain the scheme, which is marked by a clock tower. It is to be built in brick and stone, but we have no detailed particulars from the architects other than those furnished by the drawings themselves.

LIVERPOOL TRAMWAY OFFICES: FIRST PREMIATED DESIGN.

This design, submitted by Messrs. Stones and Stones, architects, of Liverpool and Blackburn, was awarded the first premium in a recent open competition in accordance with the report of Sir William Emerson, past President of the Royal Institute of British Architects, the professional assessor appointed by the Liverpool City Council. The requirements of the corporation have changed since the competition was instituted, and consequently the scheme will not be carried out as at first intended.

ST. ANDREW'S CHURCH, ALEXANDRA PARK, MUSWELL HILL, N.

The church consists of nave, 91ft. by 27ft., north and south aisles, 12ft. wide, with gabled transepts, chancel, 40ft. by 25ft., morning chapel, 39ft. by 15ft. 3in., organ chamber and vestries, and a baptistery recess at west-end of nave. The arcades and arches generally are formed of moulded red bricks, with red Corsehill stone pillars, bases, and caps. The windows are of Bath stone, with splayed or moulded red brick jambs and arches. The walls are faced outside and inside with red bricks, relieved by Bath-stone bands and moulded brick string-courses. The roofs of nave and chancel are to be of arched form, divided by purlins and ribs into panels, and supported by curved and moulded principals, all of pitch-pine, with stone shafts and corbels to carry same, and covered with red tiles. The floors under seats are to be paved with wood blocks, the passages and chancel and eastern part of chapel with marble mosaic. Accommodation will be provided for 800 persons at a cost of about £8,000. The architect is Mr. J. S. Alder, of Arundel-street, Strand, W.C. The work is being carried out by Messrs. John Thompson and Co., builders, of Peterborough.

A COUNTRY HOUSE.

The house is to be built in South Bedfordshire. The plan has been arranged so as to get as much sunlight as possible into the principal rooms, and so that the hall can be used for billiards. Externally the bricks are local hand-made red bricks used in conjunction with hand-made tiles. The upper parts of the walls are covered with white plaster roughly swept on. Iron casements

with broad leads are used in the windows. The view given to-day was shown at the Royal Academy this year. Mr. Oswald P. Milne, of Chancery-lane, is the architect.

MARYHILL DISTRICT LIBRARY, GLASGOW.

WE illustrate to-day another of the three libraries which were won by Mr. J. R. Rhind, architect, Inverness, in December last. Mr. Horatio K. Bromhead, F.R.I.B.A., President of the Glasgow Institute of Architects, was referee in the competition. Estimates have been received which amount to about £6,000, the sum allowed, and the work is going on. It will be interesting to mention that Dr. Andrew Carnegie gave £100,000 to Glasgow to build libraries; about half this sum has been expended, so that there is still £50,000 further to be spent in libraries in Glasgow. Mr. Rhind has been further successful this year in winning two more Glasgow libraries—viz., one for Dennistoun and one for Bridgeton district.

COTTAGES AT COOKHAM.

THESE cottages were erected on the estate known as The Berries, Cookham-on-Thames, which was solely intended for private residences, so, although designed for the use of servants upon an estate in the vicinity, the buildings were required to be of such a character that they would not cause any detriment to the value of the surrounding houses. All available space has been utilised in the roofs, which supply a fourth bedroom and spacious storage cupboards. The walls up to the first floor level are built hollow, and the ground floor is raised well above the level of the highest known flood. Up to the first floor local red brick facings were used, with roughcast and tile hanging above; the roofs are covered with sand-faced tiles. The cottages were erected by Mr. George Lacey, of Cookham. The architects are Messrs. Edward Hyde and Son. The drawing given to-day was shown at the Royal Academy this year.

BRIDGE AT LUCERNE.

THE Spruer-Brücke, or Mühler-Brücke, as it is sometimes called, is one of the two covered bridges crossing the river Reuss at Lucerne. It was erected in the 16th century, and is decorated inside by illustrations of the "Dance Macabre." These paintings were at one time supposed to have been painted by Holbein; but are now known to be considerably later. The small building corbelled out from the pier in the centre of the bridge is a small chapel dedicated to the Virgin. The view was taken from the Arsenal. These drawings are by Mr. Edward L. Gaunt, A.R.I.B.A., of Bradford.

TRIUMPHAL ARCH AT VICENZA.

THE Triumphal Arch at Vicenza lies at the foot of the long flight of steps leading to the Pilgrimage Church on Monte Berico, about one mile from the town. It was at one time attributed to Palladio, and is built after his style. It is now known, however, to be of later date, and was probably erected some fifty years after his death.

The fine church tower of Happingburgh, on the east Norfolk Coast, and which rises to a height of 112ft., has recently shown ominous cracks and fissures, and is about to be restored in accordance with a report prepared by Mr. A. J. Lacey, architect, of Norwich. The contractors are Messrs. John Batchelor and Sons, of Stalham.

The building of the new tower of Beckenham parish church is nearing completion; the bells have been recast and are now about to be rehung. Formerly they were six in number, the oldest bearing the date of 1624; but they have now been increased to eight. The bells and the new tower will be dedicated by the Archbishop of Canterbury on Saturday, Nov. 14.

The Baptist chapel in Abingdon-street, Blackpool, has been acquired for £10,000, by H.M. Office of Works, for conversion into a post-office.

The Church of the Ascension at Malvern has just been erected by Messrs. Stephens and Bastow, of Bristol, from the designs of Mr. W. J. Tapper, of London. The building consists of nave and choir, without aisles, seats 300 people, and has cost £10,000.

The new Cambridge and County School for Boys was opened on Saturday by Lord Avebury. The freehold and buildings have cost £10,200.

After a long delay, the construction of the new Wilmslow - to - Levenshulme line of railway has actually been commenced at Wilmslow.

COMPETITIONS.

ENFIELD.—Early in the year some ten architects were invited to compete for a new church for 600 worshippers, at a cost of £12,000, to be built at Bush Hill Park, Enfield. Designs were sent in on July 1. The committee has not yet announced its decision. The designs will be exhibited in the Estate Office, immediately opposite Bush Hill Park Station, G.E.R., this afternoon and to-morrow (Saturday) up to 4 p.m.

SWANSEA.—At a meeting of the Swansea Town Council it was decided to award Mr. Glendinning Moxham, architect, Swansea, the premium of 10gs. for the best set of plans for artisan houses. Sixty-three sets of designs were sent in.

TAMWORTH.—At the last meeting of the town council the General Purposes Committee reported that 266 applications for particulars of the competition for the proposed Carnegie Free Library had been received, the first premium for which was £20, the second £10, and the third £5. Mr. J. A. Cossins, Colmore-row, Birmingham, was appointed architectural assessor at a fee of twenty guineas. It was decided to apply to the Local Government Board for sanction to appropriate a portion of the vacant land on the north side of Corporation-street for the erection of the library.

CHIPS.

A new Methodist Church, built at Killylea, County Armagh, was opened for worship last week. Mr. Gilchrist was the architect, and the contractors were Messrs. Bright Brothers, of Portadown.

The Bristol Sanitary Committee received on Friday the report of the city engineer, in which he stated that he estimated the cost of the construction of the new road from Coronation-road to the south end of the swing bridge (work H in accordance with the Act of 1897) at £16,338, and the cost of constructing the new road from the north end of the swing bridge to the south side of Cumberland Basin, also in accordance with the Act, at £1,400. The report was adopted, and the city engineer was instructed to proceed with the preparation of drawings.

On Wednesday week, at Holy Saviour's Church, Hatherston, the Bishop of Shrewsbury dedicated a number of gifts which had been made to the church, including a carved reredos and altar and handsome sanctuary curtains.

At St. Andrew's Church, Newcastle-on-Tyne, a memorial chancel screen was dedicated on Sunday by the bishop of the diocese. The screen is 11ft. 2in. wide by 12ft. 6in. high, and is made of Austrian oak. It has been designed by Mr. W. Ellison Fenwick, of the firm of Dunn, Hanson, and Fenwick, architects, of Eldon-square.

A new Roman Catholic church at Clydebank was opened for public worship on Sunday. The new church is situated on the Glasgow-road, is Early English in style, and is faced with red sandstone. The architects were Messrs. Pugin and Pugin, of Westminster.

Walter Stiff, Emma Stiff (or Flood), and Emma Mary Flood were remanded on Monday at Bow-street Police-court, on a charge of conspiring to obtain £6,039 from the London County Council by fraudulent means. The male prisoner carried on a business as wax modeller in Goswell-road, and his premises were acquired by the County Council. He sent in a claim to the Council for over £7,247, and in the arbitration proceedings was awarded £1,208 only. It was now alleged that Stiff supported his claim by false and fraudulent books, showing the amount of his supposed turnover.

On Saturday the memorial erected at Low Fell to perpetuate the memory of five men who died in South Africa during the late war was unveiled. The work was carried out by Messrs. Morrison and McBean, monumental sculptors, Gateshead.

Mr. T. Taliesin Ræes, architect, of Birkenhead, has resigned his seat on the town council of that borough, as he is completing for that body the supervision of school buildings planned by him for the late school board, the duties of which have been taken over by the Corporation.

A Local Government Board inquiry has been held at Ashwell, Herts, into the application to borrow £5,038 for purposes of waterworks and sewerage and sewage disposal works, according to the schemes prepared by Messrs. Elliott and Brown, of Nottingham.

The Glanadda Schools, Bangor, North Wales, are being warmed and ventilated by means of Shorland's patent Manchester stoves and grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The parish church of Killyman was reopened last week, after repairs and redecoration, carried out by Messrs. Kimmett, builders, of Armagh.

Building Intelligence.

Barry Docks.—The foundation-stone of the new church of St. Mary, Holton-road, Barry Docks, was held on Wednesday in last week. The church consists of a nave and chancel 138ft. long, with side chapel, large organ-chamber, and vestries. When completed the church will seat about 1,000 adults, and the estimated total cost is £10,000. The tower will rise above the organ-chamber to the height of 113ft. The style is 15th-century English Gothic, and the design which is now being carried out was exhibited at the Royal Academy in 1901. The contract is being carried out by Mr. J. Cadwallader, of Cardiff, under the direction of Mr. G. E. Halliday, F.R.I.B.A., of Cardiff, Mr. R. Bennett being the clerk of works.

Blackheath and Charlton Cottage Hospital.—For the benefit of out-patients, a new dispensary, with medical consultation rooms, waiting rooms, &c., are being added to this hospital, which is in the Shooter's Hill-road, Blackheath, S.E. The addition will be, like the hospital itself, of red brick, with half-timbered gables and Broseley roofing tiles. The builders are Messrs. Garrett, of Balham Hill. The architect is Mr. Edward R. Robson, F.S.A., of Westminster.

Chatham.—Lord Roberts attended the consecration of the parish church at Chatham on Wednesday. Five churches are known to have been built on the site—a Saxon church, a Norman church built probably about 1200 A.D., the 14th-century church, which was destroyed by fire in 1786, the 18th-century church, and the present church, which has been built at a cost of upwards of £16,000, and on which there remains a debt of about £2,500. The new building has been carried out from designs by the late Sir Arthur W. Blomfield. In the tower, which was erected as a memorial of the Diamond Jubilee of the late Queen Victoria, is a fine Norman doorway, while let into the wall is a marble slab upon which is carved the figure of the Greek deity Euphrosyne. The goddess is seated upon a stool, and the head is gone, but the name is cut in Greek characters upon the marble. The slab was found imbedded in the Norman wall of the chapel which once stood where the south-west entrance is to-day. Immediately on the right of the Norman entrance is a Norman staircase, which was discovered when the west end of the 18th-century church was removed. The majority of the Norman remains are in the new baptistry designed by Mr. Charles Blomfield.

Dundee.—The annual report of Dundee University College, just issued, states that the adjacent grounds of Ellenbank have been purchased at a cost of £11,500 for the extension of the college, and plans for reconstructing the buildings have been prepared by Sir R. Rowand Anderson, LL.D., of Edinburgh, which have received the approval of the council and the teaching staff. It is proposed that the present frontage should be entirely replaced by a new structure almost co-extensive in length with it and standing 20ft. in advance. The total cost is estimated at about £30,000. A beginning will be made at the western end, where the present conditions are the most unsatisfactory, and the work carried out in three sections, each of which may be separately undertaken when means are available. A large addition to the separate department of chemistry will provide a new general laboratory for junior students, and will thus relieve the recent overcrowding. The estimated cost of the work is £2,500.

Edinburgh.—A special sub-committee of the Edinburgh Town Council, appointed to make arrangements for proceeding with the construction of the Usher Hall, has met, Sir James Steel, Bart., presiding. The sub-committee, after consideration, agreed to recommend that the council should exercise its powers of compulsory purchase to almost their full extent. The area, which is rectangular in form, and about 4,500 square yards in extent, includes not only the Synod Hall, but the lunc in the rear and certain property beyond it, including a few outhouses belonging to Lothian-road Public School. It was decided that it would not be necessary to buy the school itself. A house and studio on the other side of the school will be required for the purpose of affording better access. Discussion took place also as to whether the plans should be prepared by the city works department, or whether com-

petitive plans from independent architects should be invited. In the end the sub-committee unanimously agreed to recommend to the parent committee that the work should be intrusted to Mr. Morham, the city superintendent of works, and his staff. This report has been adopted by the committee.

Kensington Gore.—The church of the Holy Trinity was consecrated by the Bishop of London on Wednesday. The church, which is built of stone, externally and internally, is intended to hold about 800 people. In character it is an English treatment of 14th-century work. Eventually the fabric will comprise a wide nave, with a single aisle on the south side and a double aisle on the north, and spacious vestries. At present the nave, chancel, and the south aisle only are built, and the arches of the nave on the north side are temporarily blocked up with brickwork. The high arched roof is supported on slender columns. The wide roof of the nave is continuous, unbroken by a chancel arch, and it is intended to separate the chancel from the nave by a high but open screen of oak. The roof is treated with red ornamentation on a white ground. The building has been designed to occupy the whole of the available space, and when completed the breadth of the nave and the aisles will be 76ft. The architect is Mr. G. F. Bodley, R.A., and Messrs. Stephens and Bastow, of Bristol, are the builders. Much of the church furniture is still lacking.

Larne.—The cottage hospital in Victoria-road, built at the cost of Sir Hugh H. Smiley, Bart., has been opened this week. The building has a frontage of 140ft., and the central block has a depth of over 80ft. All the outside walls are built hollow, the lower portion being faced with Belfast red perforated bricks, and the upper portion pebble-dashed, with the gables in half-timber work. The roofs are covered with red Staffordshire tiles. The central block contains the administration department. The wards for male and female patients, each of which accommodates six adults, are situated on each side of the central block, and at the extreme ends of the building are day-rooms, which, in case of emergency, will each accommodate four additional beds. In connection with each ward, but cut off by corridors opening to the outer air, are bath-rooms, w.c.'s, &c. In the rear is the operating-room. On the first floor of the central block are three private wards and five bedrooms for nurses and servants, with two sets of baths, for patients and staff. In the rear of the building are a washhouse and laundry. Mr. James Ferris, of Larne, was the contractor. The parquet and terrazzo floors were by Mr. J. F. Ebner, of London. The work has been carried out from the designs and under the supervision of Mr. N. FitzSimons, A.R.I.B.A., of Belfast, with Mr. William Harpur as clerk of works.

Leeds.—The new hospital for women and children, which will be opened by Lady Mountgarret to-day (Friday), forms an extension of the old residence hitherto used. The new buildings, which have been designed by Messrs. Chorley, Connon, and Chorley, architects, Leeds, adjoin the old premises, and provide accommodation for an out-patients' department, a general hospital with accommodation for 48 beds, and also for a maternity department with four beds. The out-patients' department is in a semi-detached building independent of the general hospital, and contains an out-patients' hall, with registry-office, and isolation, dressing, consulting, operative, and examination rooms, as well as a dispensary. The general hospital provides for a hall, board-room, and secretary's office, and accommodation for the medical staff. On two floors there are two large wards with twenty beds each, two wards for three beds, and two single wards; together with kitchens, bath, and other rooms. There is a maternity department, with a lying-in ward and three smaller wards, with kitchens; whilst provision is made for a mortuary, with autopsy room and laboratory attached. The old hospital will henceforth be devoted to administrative purposes, and for the accommodation of the nursing and general staff. All the walls and ceilings of the patients' rooms are lined with granite silicon and plaster, and painted with ripolin. The floors are laid with terrazzo, with all the angles throughout the building rounded off. The drains are laid on concrete platforms, so as to avoid the risk of settlement, and all lines of pipes carried out in straight lines from manhole to manhole, so that

any pipe may be taken up or stopped without disturbing the surface soil. Provision has also been made for warming all incoming air, if necessary, whilst it is sought to avoid draughts by means of double windows. The cost of the buildings, which are of brick with terracotta dressings, will be about £20,000.

London County Council.—At Tuesday's meeting of this body the Parliamentary Committee were requested to advise in what form legislation might best be promoted next session for securing that the gardens in squares and similar plots of land in London should not be built upon, but preserved for ever as open spaces. A request from the City Corporation for a contribution from the Council towards the cost of widening from 40ft. to 50ft. the new street proposed to be formed across the site of Christ's Hospital was refused. Replying to various questions, Captain Hemphill said the Building Act Committee had power, where they thought proper, to refuse the plans for one-story shops. It was unfortunate that the Building Act Amendment Bill of last session was not properly understood, for there were provisions in it for safe-guarding such shops, and he hoped, when the matter was brought forward again, it would receive strong public support. It was announced that the electric tramways from the bridges to New Cross would be opened by the first week in January. Mr. John Alfred Gill Knight, A.R.I.B.A., of Godliman-street, E.C., was appointed district surveyor for South Fulham.

New London Fire Stations.—Mr. E. Smith, the chairman of the fire brigade committee of the London County Council, on Saturday afternoon opened a sub-fire station at Vauxhall. The station occupies a commanding position on the Albert Embankment, at a point near Vauxhall Cross, the Council having utilised for the site a piece of surplus land which remained over after the completion last year of the widening of the roadway on its southern side. The site is about 6,000 superficial feet in area, and its value (£2,835) has been charged to the fire brigade capital account. The station, which is lighted by electricity, has been erected by the Works Department of the Council, the estimate for the work being £8,400. The accommodation comprises an appliance room with front and back entrances, and with stables opening direct into it; watch and recreation-rooms; and accommodation for the staff of the station, consisting of one officer, five firemen, and a coachman.—Mr. Smith also opened on Saturday afternoon another new fire-station at Pageant's Wharf, Rotherhithe-street. The station is situated between the Surrey Commercial Docks and the river, and about a mile and a half from the old fire-station at Gomm-road, which originally served it. The new building has a frontage on the Thames of 92ft., and 84ft. to the street. The site cost £3,280. The station has accommodation for a station officer, six firemen, and a coachman, and possesses a reading-room and recreation-room.

Salford.—The church of St. Ignatius, which was consecrated by the Bishop of Manchester on Thursday in last week, has been built by Earl Egerton, of Tatton, in a new district. The site is a part of the ground originally belonging to the Tatton estate, occupied for many years by the Infantry Barracks, and sold by the War Office to the Salford Corporation, from whom it was purchased. It fronts Oxford-street, leading into Regent-road. The new church is about the same size as that built recently by Lord Egerton at Ordsal, and will seat 500 persons. Earl Egerton decided to adopt the round-arched Romanesque style. The material is brick, with terracotta dressings, and the nave columns are of mottled red Runcorn stone. The church has been built from the designs and under the superintendence of the architects, Messrs. Darbyshire and Smith, of Manchester. Its cost, with the furniture, is about £9,500.

The Bishop of Lichfield dedicated on Saturday last a new chancel to St. Peter's Church, Priors Leic Shropshire. The church, built a little over six years ago, consisted of plain brick nave, with tower. A new chancel of stock brick, with stone dressings has now been added at a cost of about £450.

Mr. W. A. Ducat, an inspector from the Local Government Board, held an inquiry at the Guild hall, Walsall, on Tuesday, with respect to an application by the town council for sanction to borrow £1,000 to defray the cost of purchasing land at the Pleck for a recreation ground and allotment

PROFESSIONAL AND TRADE SOCIETIES.

THE SOCIETY OF ARCHITECTS' QUALIFYING EXAMINATION.—At the recent examination to qualify for membership in the Society of Architects, one of the candidates, Mr. W. D. Jenkins, of 12, Frederick-road, Sparkhill, Birmingham, was successful in qualifying for a Special Certificate of Honours and the Gold Medal of the Society. Mr. Jenkins is the first to have attained this distinction, to obtain which it is necessary for the candidate to have passed in every subject of each section at one examination, and to have secured at least 80 per cent. of the obligatory marks.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—In anticipation of the opening meeting of the session 1903-4 of the Royal Institute of British Architects on Monday evening next, by a presidential address from Mr. Aston Webb, R.A., the new R.I.B.A. *Calendar* has just been published. It shows a further increase in bulk from 360 to 376 pages. The total membership is now 1,878, consisting of 640 Fellows, 16 Retired Fellows, 1,110 Associates, 8 Honorary Fellows, 41 Honorary Associates, and 63 Hon. Corresponding members. Last year the aggregate was 1,816, made up of 617 Fellows, 16 Retired Fellows, 1,069 Associates, 8 Honorary Fellows, 44 Honorary Associates, and 62 Hon. Corresponding members. The number of students has increased from 451 to 507. The following is the syllabus for the ensuing session:—

- Nov. 2.—1. President's Opening Address.
- Nov. 16.—2. "Le Trésor de Caude et les Monuments de l'Art Ionien à Delphes." By Monsieur J. T. Homolle.
- Nov. 30.—3. Business Meeting.
- Dec. 14.—4. "The Royal Victoria Hospital, Belfast: Its Inception, Design, and Equipment." By Messrs. Wm. Henman and Henry Lea, C.E.
- Jan. 4, 1904.—5. Business Meeting.
- Jan. 18.—6. Award of Prizes and Studentships. Paper: "Architecture in Lead." By Mr. J. Starkie Gardner.
- Feb. 1.—7. President's Address to Students. Presentation of Prizes.
- Feb. 15.—8. "The Bacteriological Disposal of Sewage from Isolated Buildings," by Professor Frank Clowes, D.Sc.
- Feb. 29.—9. Business Meeting: Election of Royal Gold Medalist.
- March 14.—10. "Plaster Decoration," by Mr. J. D. Crace.
- March 28.—11. "Electric Generating Stations," by Mr. C. Stanley Peach.
- April 18.—12. "The Statues of Wells Front, with Some Contemporary Foreign Examples of Sculpture," by Mr. E. S. Prior.
- May 2.—13. Annual General Meeting.
- May 16.—14. "The Planning of Collegiate Buildings," by the Rev. J. B. Lock, M.A., Bursar of Gonville and Caius Coll., Camb.
- June 6.—15. Business Meeting: Annual Elections.
- June 20.—16. Presentation of the Royal Gold Medal.

CHIPS.

Mr. George Scott, of Bank Buildings, Bothwell, N.B., and of Messrs. Scott and Rae, pavement and cement merchants, who died on April 6th last, has left personal estate valued at £26,705 6s. 8d., including £9,353 in the business of his firm.

Greenhill new school, Coatbridge, was formally opened on Friday by the late chairman of the Old Monkland School Board. The school has a frontage of 240ft., and will accommodate 750 pupils. The cost is estimated at £3,670.

Mr. Frank Windsor, architect, of Croydon, has been selected by the committee of the St. Augustine's parochial hall, Croydon, to carry out the work. Accommodation for about 450 persons is to be provided, with the usual offices.

At a county meeting held at St. Albans on Monday, convened by the Earl of Clarendon as Lord Lieutenant of Hertfordshire, it was decided to perpetuate the memory of the late Marquess of Salisbury and his connection with the county by the erection of a statue at Hatfield and the founding of a Science Scholarship to enable a student from any secondary school in the county to join any university in the world.

The Duchess of Albany laid, on Monday, the memorial-stone of the new Royal Waterloo Hospital, in the Waterloo Bridge-road. The new building, which is being erected from designs by Messrs. Waring and Nicholson, of Parliament-street, S.W., and is now being roofed in, was illustrated in our issue of July 17 last by a double-page perspective. For the section now in progress, at a cost of about £10,000, Messrs. Holliday and Greenwood are the contractors.

The Bishop of Winchester on Saturday consecrated the new church of St. George at Badshot Lea, a growing district situated between Aldershot and Farnham. The church, which is built of concrete and flints, with Bath-stone dressings, affords accommodation for 258 sittings, and has been erected at a cost of about £2,860.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAHO NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* * * Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

EDGAR J. SCARFE.—Inquire of B. T. Batsford, 94, High Holborn, W.C. He stocks books on all the subjects you name, and frequently at second-hand prices.

"BUILDING NEWS" DESIGNING CLUB.

SECOND LIST OF SUBJECTS.

B.—A Solicitor's Country House in stone, with stone slated roof, on a level site, surrounded by trees. The reception-rooms should face the south and south-east, with the principal entrance on the N.W. side of the house. The gardens are on the south side, below a terraced lawn. The accommodation is to be mainly on the ground and first floors, two servants' bedrooms and a bedroom on the second floor. No objection would be taken to a belvedere, lead-covered turret and flat; but this feature is optional. The dining-room is to be 25ft. by 15ft., exclusive of a bay, if any is provided; drawing-room is to be 18ft. by 15ft., and the library about 15ft. by 12ft., located conveniently for use as a business room. There must be a good roomy panelled entrance hall, say 10ft. square, with a 4ft. wide oak staircase beyond the hall and out of sight of the entrance to the house. The kitchen offices to be of a suitable kind, including a butler's pantry and housekeeper's little room fitted with store cupboards so placed as to be available for the use of the mistress also. A cloakroom and w.c. are required on the ground floor for gentlemen. Five bedrooms on the first floor, a w.c., h.m.c., and a bathroom. The cost of the house to be reckoned at 91. per foot cube to limit of £2,200. A cycle-house is not wanted, as a motor-house and stable will be built detached from the house, and need not be shown. Windows to be mullioned and lead glazed. The style based upon Tudor or Jacobean work is to be adapted to modern requirements in a simple and broad way with gables. The ground-floor rooms to be 9ft. 10in.

high, and the first-floor rooms 9ft. high. Scales to be 8ft. to the inch; two elevations, one section, and three plans. Drawings to reach the BUILDING NEWS Office not later than Nov. 30.

J. F., London.—(We can see no advantage in two competitors collaborating in submitting designs. In over twenty-one years' experience of the working of our Club, we have found the individuality of the contributors one of its leading merits, and think students should rely upon their own efforts.)

DRAWINGS RECEIVED.—"Young Michael," "Puck," "Quill," "Eagle," "An Old Scholar," "Zigzag," "Marcus," "Gwen," "Yew Tree," "Lyric," "Tudor," "Frena," "Sandy," "Adze," "Eurymedon," "St. Nicholas," "Cleddadyn," "White Heather," "Novocastria," "Sunny Jim," "Chin Chin," "Four-Point-Seven," and "Iuca."

Correspondence.

ST. GEORGE'S PLACE, KNIGHTSBRIDGE.

To the Editor of the BUILDING NEWS.

SIR,—My attention having been drawn to the illustration and article in your valuable journal of Aug. 28, describing the new buildings erected by the tenants on the freehold of the Ecclesiastical Commissioners in Knightsbridge, I feel sure you will permit me on behalf of those tenants to reply to what is evidently an *ex parte* and inspired notice of one of their officials, but, at the same time, an incorrect version.

Mention is made of the fact that friction has arisen with that "human equation," the tenants, some of whom have raised unnecessary difficulties, which have been only overcome by the insistence of the freeholders, whilst, it is said, "in some cases everything has worked most easily and satisfactorily." It is neither correct nor true to say that the difficulties have been overcome, or that in some cases *everything* has worked satisfactorily and most easily. The whole of the tenants have, either personally or through their architects and solicitors, strenuously resisted the unheard-of and unprecedented pretensions of the architect, who, not content with having a free hand (which he has used unsparingly in erecting these ornate and costly edifices at the expense of the tenants, and to which they have submitted) desires to dictate and impose upon them shop-fronts totally unsuited for their trades, thereby interfering with their just and legitimate rights to trade in a manner deemed by them, as practical men, the most attractive and remunerative, and so enable them to compete on equal terms with their fellow traders. To impose such conditions would be a restraint to trade of an insufferable character, more worthy of the feudal ages than of the 20th century.

The tenants do not believe the Commissioners themselves know of the extraordinary conditions sought to be effected by their official. A memorial has, therefore, been drawn up and signed by practically the whole body of tenants and building lessees, and it has been my duty to present it, not only formally to the Commission, but to send to every commissioner a copy, and we await the result of the memorial with every confidence, feeling assured that such a broad-minded body will carefully weigh the case brought to their notice, and render that consideration and justice for which they have hitherto been renowned to a loyal body of tenants, amongst whom are several firms of the highest standing representing important industries, whose names are household words in the commercial world. One and all deplore the friction which has been caused by the want of tact on the part of a doubtless well-meaning official, but one who, for the sake of a scheme or idea, and for architectural effect, would sacrifice the well-being and success of a large body of tenants, who have executed the work as specified, and who now desire to be allowed for the 79 years of the lease to enjoy the fruits of their capital and labour without undue restraint and interference.

At the abortive sale of the L.C.C. sites in Kingsway and Aldwych last week, the conditions were nothing like so onerous as those sought to be imposed by the architect at Knightsbridge, and yet they were scouted by a large body of representative men as being so unreasonable as not to be worthy of consideration or a bid.

It must not be forgotten the Knightsbridge land was a commercial site upon which commercial buildings were built by commercial men, and not, as stated in your article, with the object of securing monumental results—I presume to the architect.—I am, &c.,

J. J. CRIDLAN, Hon. Sec.

14, Bishop's-road, W., Oct. 22.

Intercommunication.

QUESTIONS.

[12018.]-**Certificate.**—In the event of an architect certifying for a larger amount than is due to a contractor during the progress of the works, what is the client's remedy?—**DOUTFUL.**

REPLIES.

[12013.]-**Old Coffins.**—Without a doubt, at very early periods in our country's history, coffins cut out of solid blocks of oak were used. An instance occurred not long ago, during some underpinning at the ancient church of St. Michael and All Angels in Brinkworth, near Chippenham, where, it was reported, near its porch were found some coffins cut out of solid oak butts, each laid due north and south. Considerably above them 11th century remains appear to have been discovered, suggesting that the wooden coffins dated from a still earlier period.—**HARRY HEMS.**

[12015.]-**Stove.**—We notice in your issue of Oct. 23, p. 566, under the heading of "Intercommunication," that a hot-water arrangement heated by gas is referred to. Probably this is our gas "Speedon" radiator, as illustrated in pamphlet herewith. We can recommend this radiator in every way, as it is both economical and efficient.—**THE COALBROOKDALE CO., LTD., Coalbrookdale, Shropshire.**

[12016.]-**Draughts.**—Your suggestions are not new, I think. Fancy grates have been made by many in London and provinces for warming air first and diffusing it through house, or by radiators. Inspection of the Building Exhibitions at Agricultural Hall at Islington, perhaps at Sanitary Museum, Mortimer-street, one or two of the museums at South Kensington, building journals weekly. Abridgments specifications stocked at Patent Office go to testify. Hood and Dye on "Warming Buildings" worth looking at.—**REGENT'S PARK.**

[12017.]-**Small Building.**—(1) Longman's "Notes" give corrugated sheet-iron as under, Birmingham wire gauge:—

No.	Thickness.	Weight per sq. in.	Width futes.
16	0.051 in.	880 lb.	5 in.
17	0.056	320	5 in.
18	0.049	280	5 in.
19	0.042	252	5 in.
20	0.035	224	5 in.
21	0.032	205	5 in.
22	0.020	195	5 in.
23	0.025	165	5 in.
24	0.022	150	5 in.
26	0.020	112	5 in.

(2), (3), and (4) See Laxton's Prices Book, on Timber Tables, cubical contents in floors, partitions. (5) Question of cartage, is it not, if old bricks are easily removed and sound? (6) Measure up quantities for chimney, and price it about so much per rod. If you multiply prime cost of bricks delivered by 5, it gives the value per rod, to which add price of lime and mortar. With all stocks it may be £17 to £18 per rod, or 30s. 4d. to 32s. 4d. per cubic yard. Concrete in foundations per foot cube from 10s. 3d. to 15s. (7) Pack the sashes in crates, and doors can be packed together with straw as protective if you fear damage in transit.—**REGENT'S PARK.**

In a letter to the *Times* Mr. Somers Clarke, F.S.A., draws attention to the discreditable and almost incredible condition in which the roads surrounding the Albert Hall still remain. Although that hall was opened nearly thirty years ago, Mr. Somers Clarke says that the thoroughfares inclosing and giving access to it are still neither properly made nor lighted, nor do they appear to be under the supervision and watching of the police.

An adjudication in bankruptcy is announced in the case of Harry Daniel Earl Earl, architect, of Worthing.

The Amersham Board of Guardians have instructed Mr. Belch, architect, Chesham, to prepare plans for a proposed new infirmary at the work-house, in accordance with the requirements of the L.G.B.

Princess Louise visited Croydon on Tuesday to unveil a memorial statue of Queen Victoria. The statue, the fund for which was raised by public subscription, has been erected on a site facing the town-hall and municipal buildings. It is the work of Mr. E. F. Williamson, of Esher, and represents Queen Victoria seated, wearing her crown and State robes, and the right hand holding the sceptre. The cost has been nearly £1,000.

The Duke of Norfolk is chairman of an influential committee which has been formed for the purpose of erecting a monument in Westminster Cathedral to the memory of the late Cardinal Vaughan.

Mr. Henry Wilson, J.P., timber merchant, South Shields, died on Sunday at his residence in Weston village, aged 84 years.

New premises, which have been built by the New Delaval and Newsham Workmen's Club, at Newsham, were opened on Saturday. The building is of red bricks, with stone facings, and has been erected by Mr. William Redford, contractor, from plans prepared by Mr. John Goulding, architect, Blyth. The contract price amounted to £2,030.

The parish church of Portsmouth is undergoing restoration, under the direction of Mr. T. G. Jackson, R.A.

ARCHÆOLOGICAL.

DUNFERMLINE ABBEY.—An interesting discovery has been made in Dunfermline Abbey. As workmen were employed last week removing part of the rough rubble-work, which filled a doorway in the south wall of the church, they disclosed a finely ornamented doorway of Norman architecture of the period and style of the ancient church. The arch of this doorway, which is 9 ft. higher than the floor of the church, is richly ornamented on the outer face and the inside of the vault with elaborate chevron or zigzag mouldings, similar in character to the Norman arcade work on the inside of the walls of the church. The Norman capitals are enriched with raised floriated scrollwork, and show the only examples of that kind of ornamentation in the church. The sides and lower parts of the doorway have been much mutilated, though the double capitals of those on each side are in good condition. Evidently at a later date than the formation of the Norman doorway a long flat stone had been laid across resting on the side capitals and forming underneath a shallow chamber or recess. This was found to be filled up with partly loose stones, among which, as in the space above, were a number of fine specimens of mouldings and of carved work. The abbey has been visited by Mr. W. Wybrow Robertson, architect for Scotland to H.M. Board of Works, who has stopped the preparations that were being made for the erection on the site of a South African War Memorial, which will now be erected elsewhere in the building.

CHIPS.

Ex-Bailie Robertson, of Leith, died at his residence, 1, Hawthornbank-terrace, Leith, on Monday. Mr. Robertson was born at Blair Atholl in 1830. He went to Leith in 1844, and ultimately entered and carried on successfully for over twenty years the business of carting contractor and builder. He was the "Father" of the town council.

Mr. J. H. Hughes, of Huddersfield, has been appointed resident engineer for the construction of the new reservoir in the Rhondda.

At Monday's meeting of the Edinburgh and Leith Gas Commissioners, it was reported that, in recognition of the services of Mr. Herring in connection with the erection of the new gas works at Granton, and the economies resulting therefrom and otherwise, a committee had resolved that his salary should be advanced to £1,500 on the understanding that he would undertake to continue as the commissioners' engineer for at least five years from that date. The report was adopted.

The War Memorial at Tynemouth, unveiled by the Hon. W. Brodrick last Friday, was designed by Mr. A. B. Plummer, F.R.I.B.A., of Newcastle.

The Marquess of Zetland opened on Tuesday the new east block of the Mount Vernon Hospital for Consumption and Diseases of the Chest, Hampstead. The present extension, which cost £16,000, in addition to providing accommodation for forty-five patients, also contains service and staff rooms. In order that patients may have the benefit of as much fresh air as possible, the south-west front has been constructed on the gallery principle. Only twenty-five of the forty-five beds now provided will be opened at present, as £10,000 is still needed to defray the cost of the extension and furnishing.

Archbishop Bourne opened on Sunday the new Roman Catholic Church which has been erected in Upper Kennington-lane, S.E. The building has cost about £9,000.

The Birmingham Corporation entered upon the first stage of reconstruction of tramways in the city on Monday, and workmen are engaged in pulling up the wood-paving in Steelhouse-lane preparatory to laying-down the tram lines from the corner of Snow-hill, to form a junction with the existing lines at Lancaster-street and Aston-street. This portion will be electrified in conjunction with the Aston route.

A Local Government Board inquiry was held at the Castle, Tonbridge, on Friday, before Mr. M. K. North, with regard to the applications of the Tonbridge Urban District Council for power to borrow £400 for the purposes of the Small Dwellings Act; and £130 to carry out a new scheme of surface water drainage in the St. Stephen's district.

Mr. Ritchie, M.P., laid on Tuesday the foundation-stone of a new harbour of refuge at Pwllheli, which is to cost £60,000, two-thirds of this amount being provided by the Treasury and the Cambrian Railways Company.

A large clock with Cambridge chimera has just been erected in Pen-y-fai Church, Glamorganshire, by John Smith and Sons, Midland Clock Works, Derby.

LEGAL INTELLIGENCE.

IN RE MRS. PORTER, NORWICH.—At the Norwich Bankruptcy Court last week the examination took place of Charlotte Porter, wife of Henry Searles Porter, residing at Park-lane, Norwich, brickmaker and building estate proprietor, carrying on business separately from her husband at Park-lane, Sprowston Brick Works, and Roman Hill Brick Works, Lowestoft. Gross liabilities, £49,046 12s. 2d. Expected to rank, £6,880 13s. Estimated surplus, £4,915 10s. 10d. In reply to the Official Receiver, the debtor said she commenced business in 1881. Her husband was Mr. H. S. Porter, an undischarged bankrupt, and it was in consequence of her husband being an undischarged bankrupt that she went into the business. All that she did was to lend her name and sign documents. She had little money of her own, and with the exception of £100 she brought nothing in. She kept no books of account, and the only record she had was kept in her letter book. She had never put figures together, and her husband never showed her a statement. She now knew that there would be a large claim against the estate for a deficiency on the mortgages. Instead of there being a surplus of £5,000 there would be a large deficiency, a deficiency of many thousands. The examination was closed.

IN RE F. REEVES, OLD KENT-ROAD, S.E.—A first meeting of creditors was held on Monday under the failure of Frederick Reeves, marble and granite merchant, of Bridge Wharf, Old Kent-road, S.E. Mr. Walter Boyle, assistant Official Receiver, presided. The debtor states that he traded under the name of Thomas Reeves, that of his father, from whom he took over the business in October, 1897. He attributes his insolvency to his inability to collect debts due to him and loss through an attempt to float a company to take over his business. The statement of affairs showed gross liabilities amounting to £12,248 14s. 1d., of which £11,265 9s. 8d. was expected to rank, and assets £2,708 7s. 5d. The debtor was adjudged bankrupt on the 15th inst. It was resolved that Mr. J. H. Merrett, chartered accountant, should be trustee of the estate, with a committee of inspection.

THE LONDON WATER ARBITRATION.—The Court of Arbitration appointed under the Act of last year to adjudicate upon the claims made by the eight Metropolitan water companies on the transfer of their undertakings to the Metropolitan Water Board opened their sittings on Monday at the Institution of Mechanical Engineers, Sir E. Fry presiding. The total claims of the companies, in addition to their debenture stocks, amounted to £47,435,000, against which a total amount is offered by the water board of £10,250,000. Counsel for the East London Water Company opened their case on Monday. The chief witnesses examined on Tuesday, Wednesday, and Thursday have been Mr. William B. Bryan, chief engineer, and Mr. Daniel Hill, one of the auditors to the East London Company.

CLAIM AGAINST ARCHITECTS.—At the Darwen County-court, Messrs. Dunkerley and Co., Limited, claimed from Messrs. Woods and Thackeray, architects, the sum of £32 18s. 6d. for iron goods delivered. Mr. J. Hindle, jun., for the defendants, denied liability on behalf of Mr. C. Woods, on the ground that the iron goods involved in the claim were ordered by Mr. Thackeray, the other partner, on his own private account, and not on behalf of the firm. The goods were delivered from Spring Vale Station to Mr. Bury, an ironfounder in Bury-street, to whom he owed money, and Mr. Thackeray was paid for them by Mr. Bury, less £15, the amount of the debt. Mr. Thackeray could give no explanation of the goods being ordered, and no bill had been rendered. He argued that the order, as placed by Mr. Thackeray, did not come within scope of the partnership. His Honour said the case involved a very nice and correct reading of the law. Mr. Woods said the partnership between himself and Mr. Thackeray was dissolved in July, and at that time he knew nothing at all of that account. Upon the dissolution of partnership witness asked Mr. Thackeray for his keys, but he declined to give them up until all outstanding accounts had been squared. Upon that witness put a fresh lock on the letter-box. A fortnight after the dissolution witness received an "account rendered" for the amount of the debt. Knowing nothing about it, he asked for particulars, and ascertained that the iron girders for which the money was owing had been delivered from Spring Vale Station to Mr. Bury, who had paid Mr. Thackeray for them as to £15 by settlement of the outstanding account. As a firm, Messrs. Woods and Thackeray had never dealt with Messrs. Dunkerley, although they had many times specified their goods. Mr. Thackeray had admitted his personal liability in respect to the goods to witness. Mr. Bury, ironfounder, said that Mr. Thackeray owed him £15 privately, and he had asked for payment many times. He had the debt in mind when he ordered the iron goods from Mr. Thackeray, and told him that the debt owing would be taken into account on the settlement. He never saw anyone other than Mr. Thackeray in the matter, and his transaction was not with the firm.

His Honour reserved his decision until the next Court, when he gave judgment for defendant, and upon the application of Mr. Hindle, who represented the defendant, costs were allowed against the plaintiffs and Mr. Thackeray.

CURIOUS LIGHT AND AIR APPEAL.—**RUSCOE V. GROUNDSELL.**—In the Court of Appeal, on Wednesday, Lord Chancellor, the Lord Chief Justice of England, and Lord Justice Cozens-Hardy, gave judgment in the case of *Ruscoe v. Groundsell*, an appeal by the plaintiff from the judgment of Mr. Justice Lawrence in an action tried before him at the Lincoln Assizes. Mr. Stewart Smith, K.C., for the appellant, said that his client was the owner of two cottages at Louth, in the county of Lincolnshire, and he brought his action against the respondent, who was the owner of the land on the western side of the cottages, to restrain him from interfering with the free access of light to the windows of the cottages. Each of the cottages had windows overlooking the respondent's land, which land had up to 1891, and for over fifty years before, been used as an open yard. But in 1891 the respondent had erected a shed at a distance of less than a foot from the windows of the cottages. That shed, which was 48ft. in length and 7ft. high, seriously obstructed the light to the windows. The respondent claimed that there had been an agreement in writing, within section 3 of the Prescription Act, which excluded the appellant from setting up a claim to ancient light, and, in support of that contention, he relied on a tablet set in the respondent's wall, on which was engraved as follows:—"1816. This stone is placed by John Atkin to perpetuate John Musgrave's right to build within nine inches of this and any other building." It was admitted that the cottages had been built before 1816. Mr. Justice Lawrence was of opinion that the tablet prevented the appellant from acquiring a right to light, and gave judgment for the defendant in the action. Counsel submitted that an agreement within section 3 must be such a one as would form part of the title to the property and one which a vendor would be bound to disclose. Further, this was not an agreement expressly made or given for the purpose of defeating the right to light. He referred to "*Mitchell v. Cantrell*" and "*Bewley and Atkinson*." The wording of the agreement left it so doubtful as to what it meant that it could not be said to be an agreement expressly made for the purpose of preventing the acquisition of a right by prescription to light. It might well be that the tablet had been put up to mark the boundary of the two properties, and the fact that 9in. was mentioned as the line up to which Musgrave might build rather pointed to the conclusion that the tablet was put up for that purpose. Mr. Etherington Smith, for the respondent, submitted that the fact that the stone was placed in the wall by John Atkin, was an acknowledgment by him that he was enjoying the light by the consent of Musgrave. The tablet must refer to the enjoyment of light, as it would be quite unnecessary to perpetuate the right of Musgrave to build on his property, which no one could dispute. The Lord Chancellor, in delivering judgment, said that, in his opinion, the appeal must succeed. Everything but one point in the case was covered by authority. The appellant had proved that the light to the windows of the cottages had been enjoyed for 50 years, and the onus fell on any one wishing to disturb that right to light to show that he had not acquired a right by prescription to a continuance of the same. Those who sought to do that must establish that a continuance of the right to light had been prevented by that which the Prescription Act, 2 and 3 William IV. c. 71, required to be done in order to defeat that right, namely, that the same was enjoyed by some consensual agreement expressly made or given for that purpose by deed or writing. He would assume that the tablet on which the respondent relied was an agreement in writing. The question remained whether it expressly reserved the right and was given for that purpose. Looking at the possible reasons why the parties might have agreed to put the writing there, he was unable to hold that it was in the minds of the parties to reserve to Musgrave the right to interfere with the access of light to the cottage windows. There might well be a number of reasons why the writing had been placed where it was, and looking at all the facts and especially to the mention of the 9in., he was wholly unable to come to the conclusion that it was a right expressly reserved for that purpose. The Lord Chief Justice and Lord Justice Cozens-Hardy concurred, and the appeal was allowed with costs.

The Sheffield Corporation are seeking the sanction of the Local Government Board to the borrowing of £27,740, the estimated cost of the erection of 126 artisans' dwellings at High Wincobank.

At St. Dunstan's parish church, Cranbrook, on Tuesday week, Viscount Goschen unveiled a South African War memorial to Weald of Kent Volunteers. It consists of a framework of porphyry surrounding a copper plate, bearing an inscription, and was designed by Mr. W. D. Caröe, diocesan architect.

Our Office Table.

The annual conversazione of the Architectural Association was held at the galleries of the Royal Institute of Painters in Water Colours on Wednesday evening, when about 620 members and guests attended, and were received by the President, Mr. Henry F. Hare, F.R.I.B.A., and Mrs. Hare. Mr. Hare was supported by the vice-presidents, Messrs. R. S. Balfour and Arnold Mitchell; the hon. secretaries, Messrs. Louis Ambler and Henry Tanner, jun., and by the members of the committee. Among those present were Messrs. S. H. Fellowes-Pryne and Leonard Stokes, past-presidents, W. E. Riley, T. R. Spence, Alex. Graham, M. B. Adams, A. Burnell Burnell, and G. Gilbert Scott. During the evening selections of music were rendered by Pitman's Viennese Orchestra, and vocal selections and recitations by Mr. F. Chester. The Oil Painters' Exhibition was on view, also the premediated and other drawings by students of the Architectural Association. The day-school students also exhibited some admirably executed specimens of their work, and many architectural photographs by members of the Camera and Cycling Club were hung on the screen, including some excellent illustrations of Fountains Abbey, the work of Mr. Gilbert H. Lovegrove and members of the recent A.A. Excursion.

LONDON is not, apparently, to have a monopoly of Building Trades' Exhibitions. We hear it is proposed to organise one at Sheffield, to be held in the spring of next year; and whilst wishing the promoters success, we fear that the manufacturer and merchant are getting a little tired of exhibitions, having found by experience that the amount spent on them, which is not inconsiderable, can be utilised to far more beneficial advantage in appealing direct to their prospective customers through the medium of the professional journals, which admittedly produce best results. There is comparatively little difficulty in getting exhibitions together; the trouble is to induce the right sort of public to visit them.

MR. CHARLES J. WELD-BLUNDELL, lord of the manor, has just commenced a costly scheme for the development of Amsdale-on-Sea, between Southport and Formby, on the Lancashire coast. A steel pier, a mile long, to cost £26,000, will be erected, and pleasure steamers will sail therefrom to the Isle of Man, Llandudno, &c. A double esplanade is being constructed, to extend to Formby on the one side and Southport on the other, which will be one of the finest marine drives in the world. There will be a hydro and villas built on the promenade facing the Irish Sea. There will also be an ornamental lake, spanned by bridges, while grounds are being laid out for golf, &c. Large sandhills which have taken centuries to accumulate have been levelled.

THE council of the Roads Improvements Association have discussed the report of the Departmental Committee on Highways. Great satisfaction was expressed with the recommendations of the committee, and it was resolved to take all possible steps to induce Parliament to legislate upon the lines of the report, and, in particular, it was agreed—(1) That the President of the Local Government Board should be asked to receive a deputation to urge the desirability of legislation during the next Session of Parliament; (2) that an epitome of the report should be sent to every member of Parliament with a suggestion that he should use his influence with the Government to induce them to introduce legislation on the lines laid down in the report; and (3) that pressure should be brought to bear upon Ministers seeking re-election to support the recommendations of the committee.

Colonel A. G. Durnford, R.E., Local Government Board inspector, held an inquiry last week at Hove with reference to the town council's application for sanction to borrow £15,000 for purposes of electric lighting.

At Liskeard parish church, on Friday, the vicar dedicated a new stained-glass window placed in the church. The fourlights are filled with large figures of martyrs—viz., Bishops Ridley and Latimer, Agnes Prest and Anne Askew—each standing amid the flames and carrying the Book of the Gospels. In the tracery openings are angels bearing scrolls.

The urban district council of Sevenoaks decided at their last meeting to raise the salary of Mr. S. Towson, their surveyor, from £200 to £250 per annum.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Opening Address by Aston Webb, R.A., F.S.A., President. 8 p.m.
Liverpool Architectural Society. "Street Architecture, Formal or Irregular," by W. Curtis Green.
Society of Engineers. "Bacterial Treatment of Sewage," by George Thudicum, F.I.C., Royal United Service Institution. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Address by the President, Sir William White, F.R.S. 8 p.m.

FRIDAY.—Architectural Association. "Modern Churches," by C. A. Nicholson. 7.30 p.m.
Glasgow Architectural Craftsmen's Society. "Santa Sophia, Constantinople," by Prof. Gourlay, B.Sc., A.R.I.B.A. 8 p.m.

CHIPS.

The International Fire Exhibition, organised under the auspices of the British Fire-Prevention Committee with the view of arousing public interest in fire prevention and fire protection generally, was closed on Saturday last, after a duration of about six months from the opening.

The Marquess of Londonderry opened on Wednesday a new wing of the Northern Polytechnic Institute, Holloway, which has been erected at the cost of £16,000 to meet the growing wants of the students. On the ground floor of the extension are workrooms for plasterers, masons, bricklayers, and painters, there being in the building trades section about 200 students.

At Wednesday's meeting of the Folkestone Corporation it was resolved, subject to the opinion of an expert and counsel, to accept the offer of the proprietors of the "G.B." Surface Contact Tramway System to lay down a tramway from the Harbour to the Cheriton boundary. The capital outlay will be just over £30,000 (exclusive of the cost of widening Cheriton-road). This will practically connect Shorncliffe Camp with the centre of Folkestone.

Lavender Lodge, a freehold estate of three acres, situate at St. John's-road, Clapham Junction, was sold at the Mart on Wednesday for £46,000. The property has frontages of 385ft. to St. John's-road, of about 217ft. to Lavender-sweep, and 328ft. to Limburg-road.

The life-work in water-colours of the President of the Royal Academy, and over 100 studies for his pictures in oil, will constitute the opening Exhibition of the Fine Art Society's season. Sir Edward Poynter's Exhibition is a fitting sequel to those of his predecessors in the Presidential chair—viz., Lord Leighton and Sir John Millais, both of whose studies were introduced to the public at these galleries. The Exhibition opens on Monday next.

The council of St. Michael's College, Aberdare, have unanimously accepted a site of two acres at Llandaff, offered by Mr. W. S. De Winton, and resolved to erect thereon college buildings. The cost is estimated at £200,000.

The church of St. David's, Tonyrefail, built at a cost of £3,500, was consecrated on Thursday in last week by the Bishop of Llandaff. The bishop, speaking after the ceremony, said that during his episcopate of twenty years he had consecrated 200 churches in the diocese, a large proportion of the number being in the Rhondda.

The restoration now in progress at All Saints' Church, Toynton, Lincolnshire, has brought to light some interesting features. On the south side of the nave wall is an arcade of four bays of Decorated character; two limestone pillars, octagonal in shape, but somewhat strangely standing on square bases, moulded capitals clearly cut, and 6ft. 6in. high, and 10ft. 6in. apart. In the north wall was found an arcade of five bays of about 9ft. each, three pillars and two half-pillars, Norman style, about 1150 A.D., or 200 years earlier than the south arcade. Traces of Norman painting may still be seen on the arches, but the whole of the north arcade is much damaged by fire.

The Castle Ward Rural District Council at their last meeting formally adopted the revised scheme for the sewerage and sewage disposal of Heddon-on-the-Wall, prepared by Mr. Harry W. Taylor, A.M.I.C.E. The Board of Trade required the sewage to be purified before its discharge into the tidal river Tyne, which has increased the cost. Application to the Local Government Board to borrow £2,600 will be made immediately.

The opening ceremony in connection with the Johnstone Constitutional Club at Johnstone, N.B., took place on the 22nd inst. The new club has been erected at a cost of £3,000. It is situated in the neighbourhood of the main square, has a frontage of 102ft., is two stories in height, and is faced with brick. It includes a large hall accommodating 300 people, committee-rooms, billiard-room, reading-room, games-room, and skittle alley. Mr. Watson is the architect.

LIST OF COMPETITIONS OPEN.

Skewen—Public Library (limit £2,000)	£10 10s.	Samuel Jones, Clerk, Old-road, Skewen, Neath	Nov. 9
Kilmarnock—Tenement of Shops and Workmen's Houses	£15 15s., £10 10s., £5 5s.	Robert Blackwood, Burgh Surveyor, Market Bridge, Kilmarnock	" 9
Newport, Mon.—Sewerage Scheme		T. S. Edwards, Clerk, 24, Stow Hill, Newport, Mon.	" 11
Sunderland—Additions to Town Hall	£100, £50, £25.	John W. Moncur, A.M.I.C.E., Borough Engineer, Sunderland	" 21
Bray—Pavilion and Winter Gardens	£30, £15, £10, and three of £5 5s.	Frank Bethell, Hon. Sec., Town Hall, Bray	" 31
Wakefield—Reconstructing Cattle Market	50gs. (merged), 25gs.	R. Ernest Langhorne, Solicitor, Wakefield	Dec. 1
Elgin—School (340 places)		Hugh Stewart, Clerk, Elgin	" 7
Selly Oak—Public Baths (Assessor)		A. W. Cross, A.M.I.C.E., 23, Valentine-road, King's Heath	" 7
Herne Hill, S.E.—Public Library		H. J. Smith, Clerk, Lambeth Town Hall, Kennington Green, S.E.	" 16
Windsor—Elevations for Police and Fire Brigade Stations	25gs.	E. A. Stickland, A.M.I.C.E., Borough Surveyor, Windsor	Jan. 15
Vienna—Machinery to Lift Boats	100,000, 75,000, and 50,000 kronen	The Austro-Hungarian Consulate-General, 22, Laurence-Pountney-lane, E.C.	Mar. 31

St. Austell—Waterworks	Urban District Council	T. H. Andrew, Engineer, 1, Trevanick Villas, St. Austell	" 4
Watford—Sewerage Works	Urban District Council	H. Morten Turner, Clerk, Council Offices, Watford	" 4

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2548.

FRIDAY, NOVEMBER 6, 1903.

PROFESSIONAL ENCROACHMENTS.

SEVERAL practical questions are before the profession just now. One of them is that of Education and Registration, which is being discussed with more or less keenness by nearly all the architectural societies, and has been made one of the subjects in the inaugural addresses. This question has been forced upon the profession by various considerations. Another question of equal interest is that the growing competition between the professions has been the cause of much overlapping, of members of one class interfering with the work of another. If we take the professions engaged in building and landed estates, a great deal of this overlapping or interference is taking place. The surveyor in a provincial town does not hesitate to prepare plans for buildings of an ordinary kind, and to undertake designs for houses, shops, and commercial premises, in addition to his more special duties of surveying, estate management and valuations. It must be admitted also that the architects by no means set a good example. Many of them in country towns undertake valuations of property, estate agency, quantity surveying, and are ready to enter into various matters which are not properly within their sphere. In the nature of things there is a law of reprisal. If one business or profession encroaches upon another, that other will defend itself by following the same example. When large drapery firms begin to sell jewelry and fancy articles in addition to their own business; when plumbing firms undertake general sanitary and ironmongery business, and when decorators go in for plumbing and other trades, we are not surprised if the professions suffer from the same encroachments. Nothing can be more destructive to the growth and progress of craftsmanship, than this indiscriminate interference of one trade with that of another. In the building trades it has been productive of considerable mischief and harm to the efficient tradesman and skilled mechanic. The mason complains of the bricklayer undertaking stonework, the skilled slater complains of the tiler's interference in laying slates, the competent plumber protests against the ironmonger tendering for plumbers' work and fittings, and the competent painter of various other trades interfering with his own. But the evil does not stop here: the public and the building owner suffer. The competent tradesman would be perfectly safe if his employers were able to distinguish between good and bad workmanship; unfortunately, they are not in many instances. The tests of good workmanship are not always visible, and they are apparent only to the eye of the practised builder. How much passes muster in brickwork, tile-hanging, slating, plumbing, and plastering which would not bear examination if the proper tests were applied! Then the cheaper competitors for work who carry on other trades besides their own can make an easier bargain with contractors: they are unrestricted, the rules of unions do not apply. These causes are injurious to the skilled tradesmen, and they are gradually undermining the standards of good work; the untrained hands, those who have not been apprenticed to the trade, are gradually ousting the skilled craftsman. Mr. Thomas Winder, the President of the Sheffield Society of Architects and Surveyors, in his opening address, spoke of the encroachments taking place among professional men, and the measures taken by the Surveyors' Institution

which amounted to making surveying a closed profession. He said, "Sooner or later the question would have to be faced both by surveyors and architects in consequence of the action of members of another profession. No architect or surveyor of standing would dream of drawing up legal documents, or of interfering with legal questions, and it was greatly to be regretted that members of the legal profession were abandoning professional traditions and encroaching seriously upon the duties of the surveyor, the valuer, and the land agent. Large numbers of plans were being drawn upon legal documents, often most incorrectly, by irresponsible junior clerks in solicitors' offices, and drawn with but little understanding of the meaning of the work or ability to make a correct plan. These plans were charged for, and this was unfair to clients, and would prove a fruitful source of litigation. Solicitors were also computing areas of plots, subdividing leaseholds, negotiating sales (including valuation), and, wherever possible, absorbing the duties and emoluments of surveyors and land agents. This was but another phase of the curious system by which one went to the draper for plumbing repairs, and to the chemist for stationery and literature, and it had been greatly stimulated by the issue of that most misleading publication the 4 to 1 in. Ordnance Map." We do not share the opinion as to the large-scale map, which has been found of great use by the professional surveyor; but the interference of the legal firm with estate matters and valuations and the drawing of plans is strongly to be deprecated as encroaching on the emoluments of the surveyor and estate agent. We cannot wonder that the Surveyors' Institution should have adopted alterations to their rules, and have taken steps in the direction of closing the profession. There is nothing now to prevent a solicitor from drawing his own plans of properties on deeds, of making valuations, computing areas, negotiating the sale of property, and doing many things that properly belong to the province of the surveyor and valuer. The junior law clerk, if he can draw, is often employed to put plans on documents and to make drawings which, properly, should be done by the architect or surveyor. Registration will, by rendering all services done by registered practitioners legally chargeable, render such outside interference of less value. Only the qualified practitioner will be held responsible to the client, and it is in this way only that the interference of legal practitioners and others in the manner mentioned can be prevented. There are many duties done by the professions of surveyor and architect which have become more or less common property. The drawing of plots of land to scale, negotiations relating to valuation and compensation, even the valuation of property, can be easily learned by the solicitor or his clerks, and when they have acquired such knowledge they are inclined to make use of it, especially if by such devices they can increase their remuneration and fees. There is always this risk attached to occupations that are within the grasp of the average man. They are likely to be invaded by people who have a general knowledge, so it is that the architect's vocation is so often considered to be "good game" for amateurs and others who have a smattering of building or art, and many a man of business thinks he is quite competent to conduct his own negotiations for acquiring property, buying houses, making valuations, and the like. We have even known men of this kind become their own architects and builders, in defiance of the good old adage that a man who is his own lawyer has a fool for his client. There are people in the same way who discuss political or theological questions with all the confidence of experienced statesmen and theologians. They imagine because the subject appears easy to them they

are at full liberty to pronounce an opinion; so with men who have a smattering of architecture; they can talk with composure on the design of the latest building and criticise architects' work. But though certain vocations appear easy, and the instrumental agencies employed by the professional man are simple in themselves, it by no means follows that the opinion or the design, whichever it is, is worth anything. The vocation of the architect and surveyor can only be acquired after long study and experience. Such an exercise of thought as a plan or a valuation entails cannot be so readily undertaken as the average man imagines, and any attempt to do so must end in disappointment or failure. The most disastrous interferences have been caused by tradesmen and others who have interfered with the designs and intentions of professional experts. We can imagine what the result would be in the case of medical advice or surgery, or in legal questions. But in any of these cases no amateur would dare to interfere. If he did it would be to his own risk and peril. When so many professions and not a few other vocations are protected by statute, it becomes harder for those who have not the same advantage to tolerate the injustice of interference. The plumbers were exposed to the same grievance before they adopted registration. All sorts of trades: ironmongers, painters, furnishers, and others undertook the sanitary fitting-up of houses, and the result was disaster and risk to public health.

A great deal can be done to stop this grievance if the profession would reconsider their position. One of the first steps is to make themselves masters of their business. There are many of the younger men in the profession who have never equipped themselves in matters which concern their business. We know of men who are in the habit of asking advice on sundry questions of law, which they ought to know, matters affecting building operations, sanitary regulations, points bearing on construction with which they are unacquainted, who get tradesmen to give them advice, furnish designs and estimates for work they have not mastered, such as steel construction of floors and roofs, heating and ventilating arrangements, and even decorative trades like those connected with terracotta or faience, lead-glazing, electric-light installations, and metalwork. The result is demoralising: it disorganises the relations between the profession and the trades; the latter are inclined to take advantage, and the evils of overlapping and underbidding follow. There are also men in the profession who are glad to delegate a portion of their work to engineers and manufacturers, with the result that they give their profession away.

There is a want of loyalty amongst architects; we should say one of their first duties was to jealously guard any encroachment upon those trades which largely affect design, not to throw willingly into the hands of the engineer anything which rightly belongs to the architect—such, for example, as the arrangement of iron pillars, their details, the general form and profile of iron or steel roofs; not to allow the manufacturer to undertake the arrangement of tile pavements, or decorative faience, or leaded lights; nor to give the decorative artist a free hand to select his own designs for walls and ceilings. The costly and elaborately got up trade catalogue is rather an evidence of the transference of design for sundry trades from the architect's office or studio to the show-room. Many in the profession do not scruple to select patterns for decorative plaster, ironmongery, tilework, woodwork, terracotta, &c., and they may do worse, for unless they are proficient in technical knowledge their own designs may be faulty. The profession may, however, seriously lose its prestige and influence by neglecting the study of these

trades and by recommending their clients to choose their own grates, wall, and ceiling decoration, and tile pavements or wall hangings from the catalogues of firms without any instruction or guidance. Can we imagine anything more detrimental to architecture than to allow Mr. or Mrs. Jones or Brown to determine the kind of pattern or colour which should go into a certain room of their house. Possibly they select something which is at complete variance with the architect's design, a style which does not agree with that of the exterior, &c.; a colour which is quite out of accord with the size and aspect or light of the room. The evil of this complacency does not stop here. Next time Mr. Jones or Mr. Brown wants a house built or decorated he goes straightway to the trade firm and gets them to furnish designs and estimates. The example spreads. Mr. So-and-So finds out that Mr. Smith, the builder, prepares designs and estimates for buildings, or that the most elaborate and artistic designs for decoration are furnished by a large firm who do many architects' work and supply them with designs. The conviction takes root that these large trading firms can make their own designs, and that their direct employment saves the architect's fees. We do not say the educated refined client follows such an example, but there are hundreds of the public who do, who cannot make any distinction between ready-made stock designs and those which are the result of thoughtful study of the actual conditions, and a wide experience in design to be acquired only by special education. To raise the standard of education amongst architects, so that they may more jealously guard their own interests as professional advisers, is one of the chief ways to combat the threatened invasion of the rights of the profession. Men enter the ranks every day with only a very vague conception of the duties and responsibilities of the vocation; with imperfect views of the influence of architecture on the subsidiary arts and crafts. Only by defining the boundary and outworks of the profession by a course of study which shall take in all the side and by-paths can we hope to show the extent of the architect's vocation, and make the young practitioner realise his true position. The public, too, need to be informed. So long as they imagine the builder, or the estate agent, and decorator can furnish designs for houses, or that the firms of manufacturers can supply them with designs in the latest and best art fashion, they do not trouble to inquire into the vocation of the architect.

The kind of instruction required to raise the standard of the profession is one that will grasp the essentials of practical work in various branches. The architect must be taught to develop the powers of his mind so as to be capable of meeting contingencies whenever they arise. The mere acquisition of facts and book knowledge will not do this. He must know how to bring his mind to bear on the practical wants of building, be able to tackle any problem in construction, iron and steel; the details of terracotta; know sufficiently the principles of such things as plumbing, hot-water and steam-heating, ventilation, metal and woodwork, of ornamental design as applied to various trades, so as to be able to control and supervise them, and to determine their limits without having recourse to the opinions of others. Wherever the guidance of principles forsake him, he falls back on the extraneous aid of others to help him over the difficulty, and to furnish him with designs which are often without a true motive or logical basis.

BUSH HILL PARK CHURCH COMPETITION DESIGNS.

IN the rapidly developing and semi-rural neighbourhood of Bush Hill Park, near Enfield, a new church has been in contemplation to take the place of a temporary

structure which at present does duty. An excellent corner site between two roads—Village-road and Park-avenue—has been selected, and designs were sent in last July for the new edifice. Ten architects were invited to compete, and the results of their labours were on view last week at the estate office. The conditions were simple: the church was to seat 600 worshippers at a cost of £12,000, the material was to be either brick or stone—preferably the latter. As the competitors were not hampered as to site or as to style, a good opportunity was presented. Considerable talent and labour have been expended on the designs as a whole, and some of the drawings are finished with much care, and have highly-coloured perspectives. As usual, there is much wasted effort and misapplication of study in style, and only three or four of the designs can be seriously considered in regard to either plan or cost. Mr. W. D. Carie, F.R.I.B.A., the assessor, has selected three out of the ten designs, and has reported to the committee on their merits. This document is not made public, though we should have liked to have seen the grounds of the decision. Consideration of cost, no doubt, was chiefly uppermost in the mind of the assessor, in which case he had no alternative but to select a design which was simple in plan and treatment. The others have not the claim of simplicity to an equal extent, though they are well studied. One certainly has merit both in plan and detail. The design placed first by the assessor does not appear to have given satisfaction. The committee, at least, have made their decision, and have selected the third to be carried out, with apparently the consent of the assessor. The design first chosen is, it must be admitted, roughly drawn and inadequately shown, and there is no attempt at finish, and not a few of the competitors have expressed their astonishment at the decision. One of the competitors, a gentleman of some experience in church building, has indeed said that the award has, for him, taken away the bitterness of the disappointment. Be this as it may, there is a certain simplicity of treatment and quaintness in design which commends it to the artist, though these qualities will, with many, scarcely compensate for the roughness and unfinished appearance of the drawings. Draughtsmanship is certainly no indication of merit of design, though it may be an indication of personal interest. In the matter of style a church for a rural or semi-rural district as this is should certainly be treated in a less formal and dignified manner than would be proper to a town or suburban district. In Bush Hill Park it will not have to compete with lofty houses and buildings, but with villas mainly of two stories. We are not sure that this point has been taken into consideration. Nor is a very ornate style the most suitable for a rural parish. Two or three of the designs submitted are pretentious in style and their detail very elaborate. They have large and lofty towers with spires, while there are other designs which show very small and feeble apologies for them, which a church is better without, and cost more than their significance justifies.

The design placed first by the assessor, by Messrs. J. O. Scett and Son, "B. B.," comes with a good name; it has the merit of being in plan a simple solution, and avoiding all external breaks, which invariably add to the cost of building; the outer walls run through from end to end, only broken by the tower at the south-west corner, which stops the aisle. (We are here using the points of the usual Orientation.) The nave is four bays in length, the aisles are gabled, which supersedes a clerestory arrangement, and therefore any great height in the nave. The font is at the west end of nave. The vestries are at the north-east corner; the choir vestry projects beyond the aisle wall, and has an entrance externally

for the choir, as well as internally. It adjoins the clergy vestry, and the entrance from sanctuary is between the organ-chamber and the latter. A straight passageway from the choir vestry to the morning chapel is thus formed without steps. The chapel on south side is contained within the boundary of the south aisle wall, and has thirty-eight seats. The choir and sanctuary arrangements appear to be good. There are six steps to the foot-pace of altar, and a large five-light window is placed above the altar; the end of sanctuary projects a little beyond the morning chapel, and both have square ends externally. As a whole, the plan is a simple basilican type of arrangement, without transepts or projections of any kind. Externally, the treatment is plain almost to a fault, the gabled ends are very simply treated, and the tower is massive, the upper stage being octagonal, with indented parapet and buttress on each alternate side, springing from a broach, above which rises a slim shingle spire, such as one often sees in Sussex and Kent. The effect is picturesque. A full-proportioned tower and spire is not always desirable, as it is not an indispensable adjunct. As one authority on church building has said: "If a good tower cannot be had, it is better to leave it to be added afterwards, and the money which would build a poor tower is better spent in thickening the walls or improving the fittings." Internally the arcades are supported by square-shaped piers, from which spring obtuse-pointed arches. There is a plain series of lancets under one arch at the west end. There is a well-designed doorway on the west side of tower. The roof is boarded and "waggon" shape. The design the assessor placed second, under the motto "Virtute non Astutia" (W. O. Milne) is well grouped. The nave and chancel roofs are on same level throughout, the tower is at the south-west corner, with a narthex between tower and porch on the north side. These terminate the aisles. The plan is economical. The chancel, a square-ended termination, is the whole width of nave; there is a chapel next it on the south side, apsidal-ended, a little shorter than the sanctuary, and on the south side, projecting from the chapel, is a porch and baptistery. The position of the font here is objectionable, being too far from the west-end. With this exception, and the three steps down from chancel level to chapel, there is not much to find fault with. These steps occur on the north side of chancel to clergy and choir vestries. The vestries are well placed, and slightly project northwards. The nave has five bays of arches, and has an open timber hammer-beam roof. The length given in the plan indicates a narthex of 8ft., a nave 72ft. 3in. by 25ft. 8in., and 32ft. length of chancel and sacrum. The aisles are 11ft. 8in. wide. The tower is massively treated and of good height, crowned by a spire of moderate proportions, though of sufficient height. A well-drawn coloured perspective taken from the eastern end of church accompanies the plan and elevations, which are neatly executed and fully detailed. It would have been better if the steps to the chancel were mainly placed inside instead of outside the altar rail. For ordinary churches there may be one step at the entrance to chancel, and a second one at the entrance to sanctuary, the others within the latter.

The design placed third and since selected by the committee certainly shows ability; it is by Mr. J. S. Alder. The church has its axis rather north-east and south-west, and therefore does not orientate, one side being parallel to Village-road. The plan forms, as in the last, a parallelogram, except that the tower at the west end of south aisle (we are using the customary points of the compass in an ecclesiastical sense) and the corresponding porch on the north side break the line and project. There is a small semicircular baptistery at the west end of nave, which

has four bays of arches to the chancel. The clergy vestry and adjoining porch project also on the north side, while the choir vestry adjoins the sanctuary. This is questionable; the former vestry, at least, should communicate directly with the sanctuary. The morning chapel on the south side of choir and sanctuary does not project beyond the wall lines as in other plans, and the eastern wall is almost in a line with that of the sanctuary; but a porch projects on the south side of aisle next the chapel. The ritual arrangements on the whole are good. The nave accommodates 330, and the aisles 90 and 50 persons, the chancel 50, and the chapel 50—including other parts, 600 persons. From an architectural point of view the design of Mr. Alder holds its own; the proportions of the building are pleasing. The author has selected a rather late phase of the Decorated—perhaps a little more elaborate than necessary, but we should say within the amount likely to be expended. There is a slight transeptal break at the chancel externally; the aisle windows have traceried heads, and the clerestory lights are in pairs in each bay. The spire is of commanding proportions, and the base is surrounded by pinnacles, which rise vertically at each of the eight corners of the spire, connected by a cornice at the top. This octagonal base forms an agreeable transition between the tower and raking lines of spire. The belfry windows are certainly too low down, a point mentioned by the assessor in his report; but this is a detail. Internally the roof of nave is boarded in pine, and is of the "barrel" type, divided by ribs and purlins into panels. The effect is shown in a firmly-drawn ink perspective. The external view of church, shaded in Indian ink, is rather laboured. We hope to illustrate the design shortly.

"Experto Crede," by Mr. H. Roumieu Gough, is decidedly one of the best plans. The church is well grouped, and the nave and aisles are of good proportion. The dimensions given are the following: Nave, 94ft. 6in.; choir and sanctuary, 44ft. 3in. by 23ft. 9in. wide; aisles, 10ft. in width; and there are five bays in nave. The organ-gallery is placed at the west end, and there is a baptistery at the south-west corner; and next it the tower projects independently from the south aisle. There is a long morning chapel, 40ft. 4in. by 17ft., with apsidal end, with a lobby entrance at end of south aisle. The clergy vestry is next the sanctuary on the north side, with a door communicating into choir-vestry, which latter has an independent door for organist and choir. A lobby at end of north aisle corresponds with the south one. The site plan shows that the author has duly observed the orientation, the axis of church running exactly east and west, which brings the building across the corner between the two roads. Externally the style is of an Early English character, with plain lancets lighting nave and chancel clerestory, with small coupled lancets to the aisles. At the west end the gable is pierced by three lancets. The tower and spire are of dignified proportions and height, with corner pinnacles at base which look rather heavy. The nave and chancel roof is unbroken in level throughout, which gives dignity to the sanctuary end. The plans show a knowledge of church planning and ritual arrangement. Internally the roof is of timber, with plaster between ribs of nave; there is a metal screen between nave and chancel, and the latter has a close-boarded, barrel-shaped roof. The drawings indicate stone as the material throughout.

"Lux" (Mr. H. O. Ellis) shows a plan with tower rising from centre of west end, forming baptistery below, north and south aisles with porches. The chapel projects from south aisle, and has an apsidal termination. The clergy and choir vestries are on the north side of chancel. An elaborate

coloured perspective shows a Late Gothic treatment with flat arches, and internally the roof over nave has a flat panelled wooden ceiling, with principals forming a flattish curved rib of elliptical shape, springing from wall shafts, the spandrels pierced with upright cusped openings. The drawings are cleverly executed. "Early English" (Mr. J. W. Cooksey) shows a plan correctly orientated, as in the design of "Experto Crede." The author adopts passage-aisles, with wide nave and transepts, the south one being occupied by the morning chapel, with apsidal end. The author's west elevation is somewhat spoiled by the flat-topped wings which terminate the aisles, which, with the gable in the centre, is rather uncommon. A tower and spire projects from south aisle. There is a very elaborate and artistically coloured interior, and the drawings show skilful detail and finish, but are coloured a dark muddy brown. "Experientia" (Messrs. Newman and Newman) also adopt passage aisles and wide nave; the church is rather too long in proportion. The building is of red brick; the arches are abrupt, and the spire is square in plan and of stone, springing from a rather squat tower; the nave roof is boarded, and forms a flat "barrel" shape in five bays. "San Esteban" (Messrs. Paine and Hide) is the motto of a clever set of drawings and perspective shaded in ink. The nave is 91ft. long, of six bays; a baptistery projects at the west end, and the tower rises outside of south aisle and forms porch; there is also a north porch on the other side. There is an outside entrance to choir vestry, which is desirable, and the chapel is placed on south side, with porch at end of south aisle. Two designs are submitted. Design B is of red brick and slate, and has a lead spire, rather low; while Design A represents a stone church and red-tile roof.

"St. Stephen" (by Mr. W. Gilbee Scott, A.R.I.B.A.), is an elaborate and carefully-executed set of drawings, with a plan intended to afford a large congregational area in the nave. The aisles are widened out like transepts at the eastern end; there are passage aisles and a low tower and spire at the west end of south aisle. The baptistery forms a low gabled story at the west end, and includes a porch at north side which abuts against the tower. The interior shows an arcade of segmental arches, with clerestory over, and a ribbed, boarded roof of elliptical shape over nave. The walls are of stone, and the roof-covering tile. A cleverly-tinted perspective shows a turret or large ventilator over the nave at the eastern end. Although there is ability, the details are unsatisfactory.

"Maltese Cross in Circle," by Mr. E. B. Ellis, is a very ornate design in a florid Late Gothic, with crocketed spire and other ornate details. The plan shows passage-aisles, a squat-proportioned chapel, and the east end is not well adapted. There is a flat-timbered roof, with tie-beam and ornamental braces. The drawings are artistically executed.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting for the new session of the Royal Institute of British Architects was held at 9, Conduit-street, W., on Monday evening, when there was an overflowing attendance, the visitors present including many ladies. Upon taking his seat, the President, Mr. Aston Webb, R.A., F.S.A., was greeted with an outburst of hearty cheering.

Mr. ALEXANDER GRAHAM, F.S.A., the hon. secretary, announced the deaths of several members, including Mr. H. W. Brewer, Hon. Associate, whose imaginative ability and skill as an architectural draughtsman displayed the results of his deep research and intimate knowledge of English and Continental architecture of the Mediaeval period in a manner that had given delight to architects during the past two generations. It was hoped that an exhibition of his

drawings would be held at the Institute. Other recent losses by death had been those of Professor W. H. Corfield, the eminent humanitarian, Hon. Associate; Mr. Herbert Ford, Fellow; and Messrs. Arthur Edward Bartlett and James Martin Brooks, Associates. A vote of condolence with the relatives of these five deceased members was passed in silence.

THE OPENING ADDRESS

was then read by the PRESIDENT. He remarked that as regards our membership, 97 new members have been elected during the year, and we have lost 55 by death or resignation. Of our new members 26 are Fellows and 71 Associates, and, in addition, 13 Associates have been elected to the rank of Fellow. All this, the President continued, is satisfactory, as far as it goes, but it does not go nearly far enough; and we must not be content until this Institute includes among its members all reputable practising architects, &c. at any rate, until we are satisfied that we have thoroughly investigated and removed, as far as is possible, all reasons for this not being so. One matter concerning the affairs of this Institute which must shortly be dealt with is the question of

THE ELECTION OF FELLOWS,

which, under existing rules, can hardly be said to meet the views of anybody. It is not very satisfactory to the Fellows on account of its indefiniteness and uncertainty; and it is even less so to Associates, who, not unnaturally, object to find admission to Fellowship less difficult than entrance to Associateship. And yet it is by no means easy to devise a remedy for this state of things. It is easy to say that everyone wishing to join the Institute must do so as an Associate but under our charter everyone desirous of becoming an Associate must first pass an examination, while there are, admittedly, many whom we should like to join us, who, from their age or standing, or want of leisure, could hardly be asked to submit themselves to the examination qualifying for Associateship. How is this difficulty to be overcome? The only way that occurs to me is to do as was done in the case of Associates; and fix a date, say four or five years hence, after which, except in very exceptional circumstances, entrance to Fellowship otherwise than through the Associateship is absolutely closed. The fact that this would make the Fellowship somewhat more difficult to attain would increase its value in the eyes of the profession and the public, and would, in my opinion, rather attract than discourage membership. It was distinctly so in the case of the Associateship, and I believe would prove to be the same in the higher grade. But, if this were done, it would be necessary, during the intervening period, to open the doors to the Fellowship wider than at present, so that no reputable practising architect desiring to join us should be debarred from doing so. This is a question for the members of the Institute themselves to settle, and the Council would be glad to hear a full expression of opinion on a subject that must affect the future welfare of the Institute.

THE A.A. AND THE R.I.B.A.

An event in which this Institute has taken a keen interest is the acquisition of a permanent home by the Architectural Association. It is a striking testimony to the high appreciation in which the work done by the Architectural Association is held that the Architectural Museum buildings and their contents should have been handed over to the Association as a free gift by the unanimous wish of the subscribers to the museum, accompanied by the full approval of all members of the profession. But the Association have a serious work in hand to adapt the premises to their present and future requirements, involving them in an outlay far beyond the means at present at their disposal. Your Council felt sure they were interpreting your desire to show the interest of the Institute in the work, and have voted a sum of £500 towards the building fund. The day-school so successfully started by the Association seems destined in its new premises to work almost a revolution in our architectural education (or want of it); but as I went through the spacious courts of the Ecole des Beaux Arts the other day, with their full-size models of columns and entablatures, together with examples of Renaissance and Mediaeval work, I said to myself: the Architectural Association are only at the commencement of their work; they cannot stop, but must go on, and when they have completed their schools must complete and extend their museum, and we older architects must take care

to see them through with it. It has been a pleasure to the Institute for many years to lend this room to the Association for their meetings, and we shall miss them when they go; but we hope often to have their presence amongst us, for we need the energy and initiative of the younger men. In this connection I may briefly refer to the question of our own premises, mentioned in my last address. I then ventured to express my own opinion that this question of premises, though very important, could hardly be considered an immediately pressing one; and the question of a joint building has now been solved by the gift of premises to the Association. At the same time, your Council and officers have not lost sight of the matter, and it is possible they may have some proposals to lay before you in connection with this subject later in the session.

CONDITIONS OF CONTRACT.

Another event must be noted—i.e., the adoption and issue of a form of conditions of contract, which has been accepted both by the Institute of Builders and ourselves. (It is some indication of the importance of this document, and the complicated nature of some of an architect's work outside his art, that this result has taken some eight years to arrive at.) This contract, while recognising the absolute authority of the architect over the workmanship and materials used on the works, has defined, as far as is possible, the relative responsibilities and duties of the client, the architect, and the contractor; and though it is, of course, too much to expect that any document could be drawn that would meet every case that may arise, we believe it will be found of great use to all engaged in building operations. The last Council election was made the occasion of bringing before us again very prominently the question of

THE COMPULSORY REGISTRATION OF ARCHITECTS.

As stated in a circular sent round to members of the profession, it is some sixteen years since this matter was first formally brought forward and a bill prepared; but in reality the subject was mooted by members of the Institute as long ago as 1854, and brought up in subsequent years, without, however, any action being taken. I mention these dates to show that inaction on the part of this Institute has been deliberate and intentional, and does not arise from any want of due consideration of so important a matter. For myself, I was honorary secretary of this Institute from 1889 to 1892, when the question of registration was brought most prominently forward, and thus became well acquainted with the details of the proposals and the arguments for and against them. Those arguments appear to me to remain much the same to-day, on both sides, as they were then. Then, as now, there was a considerable body of opinion in favour of the proposal, and I certainly do not wish in any way to minimise the amount of it. Then, as now, there was a considerable body of opinion strongly against it, and under these circumstances, I venture to say, the thing for the moment is outside the realm of practical politics; for any experienced politician will tell you that Parliament would never grant compulsory powers of the sort proposed, except at the general request of the members of the profession interested, and at present there can be no doubt that the profession is sharply divided on the point. I think I ought to say to you quite frankly, as your President, that personally I am not a supporter of the proposal at the present time, though I agree that the large body of opinion in favour of it cannot and must not be ignored. Evils there undoubtedly are, which should be removed; but, personally, I would try every possible alternative before applying such drastic remedies as those proposed by this compulsory registration, which, I believe, must be repugnant to every artist, whether a supporter of the proposal or not.

ARCHITECTURAL EDUCATION A FORWARD MOVEMENT.

I am reminded of a story you will probably all remember, told by the late Bishop of London at one of our dinners, of an Oxford Don leaning over a wall and watching two undergraduates trying to induce a tortoise to put his head out of his shell by holding out some tempting bait, but without result; and at last the Don quietly saying to those undergraduates, "Don't you think, gentlemen, you had better try the other end?" And I would venture to say to you, gentlemen, don't you think we had better try the other end?

If, as I think, there is no probability of getting what we all want—a higher appreciation of architecture—by legislation at the present time, would it not be better to redouble our efforts to gain the same results by raising the standard of architecture amongst ourselves, by encouraging the higher education of our young men, so that in time superior attainments may make membership of this Institute a recognised qualification in the eyes of the public, as I believe is the case already to a great extent, not only at home but in the colonies also? Professor Kerr, in a very interesting address on registration, said it was open to question whether, when this Institute started standing committees on Art, Literature, Practice, and Science, it should not have added a fifth on Education; and I think he was right. Education is everywhere the cry, and if this Institute is to take a more prominent part in architectural education, it will be necessary to depart, to some extent, from the position it has taken in this matter up to the present time. Up to the present we have been satisfied, and I think rightly so, by endeavouring to suggest a standard of architectural education by means of our examinations, leaving the preparation and education of students to others. During the last session your Council had laid before them for their consideration certain draft proposals on architectural education, drawn up by a body of well-known architects interested in this question, though not at present members of this Institute, including such well-known names as Mr. Reginald Blomfield, Professor Lethaby, Mr. Mervyn Macartney, and Mr. Halsey Ricardo. These proposals set forth the proposition that neither the system of articulated pupilage, nor the training in polytechnics and art schools, had proved satisfactory, and that a combination of the two systems was desirable; that architectural education at present suffers from want of organisation, and should be taken up by a representative body of architects—such as this Institute—which shall be accepted by the public and profession as authoritative. The proposals suggested a preliminary course of training in schools and workshops, and a subsequent course in the office of a practising architect, an endeavour being made to co-ordinate and bring into line existing institutions by the adoption, in conjunction with these institutions, of a uniform system with a central body such as this Institute at the head. This, omitting all details, which are, of course, important, gives a fair idea of the proposals, and commended itself to the Council as not only a desirable proposal, but also an eminently practicable one. The Council having ascertained that the authors of these proposals would be willing to assist the Institute in working them out, by appointing some of their number to act on a committee, the Council have appointed an education committee; and amongst them outside the Institute who have accepted an invitation to join our deliberations are Sir Arthur Rickard, Principal of London University; Mr. T. G. Jackson, treasurer of the Royal Academy; Mr. Sidney Webb, L.C.C.; Professor Perry, of the Board of Education; and Mr. Basil Champneys; while the authors of the draft proposals nominated Mr. Reginald Blomfield, Professor Lethaby, Mr. Halsey Ricardo, and Mr. Macartney. This committee has met and discussed the matter, and, with the aid of a sub-committee, has drawn up and adopted a report which is now under the consideration of the Council, and I am not, therefore, in a position to bring it before you, though I hope to be able to do so early in the course of the present session. We are encouraged to hope that we may be enabled to obtain the co-operation of the various teaching bodies in London in the scheme, and in course of time to extend our operations to the chief cities of the kingdom. We also hope to constitute a board of architectural education, bringing upon it distinguished men interested in the subject, whether members of the Institute or not, its main duties being those of an advisory board on the courses of architectural studies in the various schools and their examinations. As the scheme develops we hope to have the assistance of our allied societies, and to offer facilities to their members to participate in the advantages of these improved methods of education; and first and foremost we hope to unite in one great effort for the improvement of the education of our younger brethren, and give them advantages we sorely miss ourselves.

The President then reviewed some of the principal buildings and architectural events of the year, and proceeded to discuss

GOVERNMENT CONTROL OVER PUBLIC IMPROVEMENTS IN AMERICA AND FRANCE.

The visit of Mr. McKim last summer naturally brought into prominence American practice in matters connected with our art, and especially with the control exercised in America over public improvements, and he left in our library a book containing a report which deals with the improvement of Washington by laying it out on a large and comprehensive scale. I commend a study of this book to all interested (and what architect is not) in the laying-out and improvement of our great cities. This book recounts how a small body of experts were appointed to prepare and submit a general plan for the development of the entire Park system of the district. This committee, I understand, virtually put aside their large and profitable private work for nearly a year, and devoted their time and experience to the service of the nation, a sacrifice made without any pecuniary reward. The committee consisted of two architects—Mr. Burnham and Mr. McKim—a leading sculptor, Mr. St. Gaudens, and Mr. Olmsted, whose name is identified with what is best in garden architecture in America. For the proceedings of this committee I must refer you to their report, merely stating here that a short tour to the principal capitals of Europe was made, and then a comprehensive plan for the laying-out of Washington was produced, and laid down on the noblest and grandest lines, fully illustrated by drawings and models. The committee describe the realisation of the scheme as a stupendous task, much greater than any one generation can hope to accomplish; but they add that the hearty and intelligent co-operation with which the plans have been received by the officers of the Government, the committees of Congress, and the public generally, makes it practically certain that the development of the national capital will be prosecuted on the lines proposed. Since this was written a large sum has been voted, which will enable a substantial start to be made. Again, at our annual dinner I ventured to give some particulars of a commission appointed under the Charter of New York, composed of experts, who also act without fee, to advise in all art matters in connection with New York. This is carrying out to some extent the more complete system in existence in France, where the care of all public buildings in Paris is intrusted to (1) the Minister of Public Instruction and Fine Arts; (2) the Minister of Justice and Public Worship; (3) the Prefect of the Seine; and (4) the Prefect of Police. Each of these ministers is advised by a council, mainly formed of architects of distinction. The duties and constitution of these councils are very fully set out in a book by our late secretary, William H. White, entitled *Architecture and Public Buildings*, published in 1884, which contains a great deal of most interesting information on this subject. It is under this direction that Paris as we see it to-day has been produced, and the same system is followed all over France. As the author says: "None, having an understanding of these matters, can traverse Paris without feeling that the authority which initiates and controls the great works of architecture in that capital is a real and competent authority, to which the State turns for guidance and on whose judgment the Parisians rely." Every public building throughout France, great or small, has an architect attached to it, and, where necessary, an assistant architect, who, commencing in some humble capacity at the Council of Civil Buildings, in due time is admitted as assistant to this Board, or Council, which gives him right of presentation to a public building in course of construction, as subordinate to the architect who is carrying it out, spends his days on the works, and may rise, if he conducts himself well, to be assistant architect or joint architect to a building, and ultimately architect-in-chief. In course of time he is summoned to take the place of councillor on one of the various Boards, and ultimately the Academy of Fine Arts, who educated him, will hear of him again, and finally elect him to their body. Thus the State not only assists in providing an efficient system of architectural education, but also provides itself with an efficient body of trained architects to undertake its public buildings, all working on a well-defined tradition, and producing works of great excellence, which we cannot but admire. I do not propose to compare these systems with the course adopted in this country, partly because you are all well aware what that is, and also because I am afraid the comparison

could hardly be in favour of this country. Not that I mean for a moment that the French system in its entirety would be suitable here; it tends no doubt to a loss of individuality, which would hardly be tolerated here, for though we talk a good deal of working on traditional lines, I am not sure whether we have yet learnt the lesson of sinking our own individuality sufficiently to do so.

WANTED, AN EDILE OF PUBLIC BUILDINGS.

I have mentioned these systems in force in France and America to draw attention oncemore, as I ventured to do last year, to the pressing need there seems to be in Great Britain; and which, I think, most of us feel, for some authority to whom schemes of public improvements should be submitted, not necessarily for sanction, but for consultation and advice. The work could hardly be intrusted to any single individual, but there would surely be no difficulty in finding men of skill, taste, and authority enough, and with patriotism enough, to form such a commission as that established in New York, and on the same terms, if asked to do so by His Majesty's Government. The public are singularly apathetic in the matter. We have so long preached to them the beauty of old work that they have apparently taken our view and regard modern work with comparative indifference. They resent, and no doubt in many cases rightly, the least interference with ancient buildings, but treat with unconcern the vast modern changes now taking place in our cities.

THE STUDY OF THE PAST,

invaluable to the student, delightful for instruction, and refreshment to all of us, must not take the place—for us at least—of the all-absorbing present and future. Last century was spent by us in research and retrospection; let us now show the result of our studies and spend this one in action and progress. Let us see that our buildings are beautiful, as beautiful as we can make them, and with a beauty that tells of our time—not original, perhaps, but at least distinctive; let us see that they meet the present complicated requirements, that they are well placed for sun and air, cheerful, wholesome, gladdening; that we put something of ourselves into them, in order that they may give out something to others, and let us remember how great a responsibility rests upon us architects in our work. Ruskin, addressing the Architectural Association, once said: "What a peculiar importance and responsibility are attached to your work when you consider its permanence and the multitudes to whom it is addressed. We frequently are led by wise people to consider what responsibility may sometimes attach to words which yet, the chance is, will be heard by few and forgotten as soon as heard. But none of your words will be heard by few and none will be forgotten for five or six hundred years, if you build well. You will talk to all who pass by; . . . all those little sympathies, those freaks of fancy, those jests in stone, will occupy mind after mind of utterly countless multitudes long after you are gone; you have, not like authors, to plead for a hearing or to fear oblivion. Do but build large enough and carve boldly enough, and all the world will hear you; they cannot choose but look." Let us, then, resolve that we will go straight forward, adding our little something to the great story of our noble art.

Guests of the ages at to-morrow's door.
Why shrink we? The long track behind us lies,
The lamps gleam, and the music throbs before
Bidding us enter; and I count him wise
Who loves so well man's noble memories:
He needs must love man's nobler hopes yet more.

LORD WINDSOR, the First Commissioner of Works, in moving a vote of thanks to the President for his remarkable and suggestive address, observed that Mr. Aston Webb had dealt with matters which did not affect that Institute alone, but very deeply affected the welfare and amenity of the whole population of the kingdom, who had their own share and interest in the architectural appearance of our great towns and cities. With reference to the advantages and importance of having some recognised body of competent persons who would advise those responsible for obtaining designs for great public buildings in this country, he did not doubt for one moment that the artists who were foremost in all branches in this country could not hesitate to give their services to the State for such honourable work, and there were few of them who could doubt that London in the past had suffered terribly from the want of a broad view of what the designs should be which should regulate the chief architectural works which

should make the Metropolis a magnificent city. The instances of what was being done at Washington by the foremost architects of the United States, who were gladly giving up their time and abilities to help the Government in a great work without applying to the treasury for any expenditure in aid, was a very practical illustration of what could and should be done. He expressed his absolute sympathy and concurrence with the words of the President when he hoped that an advisory body of competent persons should have a voice in the laying out on a large scale of the streets and buildings of London. If the views of the President were those of the Council of the Institute, he should gladly undertake to lay them before the Government, and whether it might be possible that anything would be done or not for some time at least, no time would be lost in having them fully considered. London had suffered terribly in the past from the lack of a broad view of what the designs should be which should regulate the chief architectural works, and make our great Metropolis magnificent. Surely all felt now that if the designs and the plans for dealing with Whitehall had from the very inception of the Public Offices been laid out on broad lines with a really fine scheme, a most magnificent approach to the Houses of Parliament would have been secured. The blame surely did not rest upon the architects employed, but upon those who employed them. As regards the trees planted in London along the streets, his personal opinion was that we were rather too much afraid to prune down. He had seen from letters in the newspapers that there was an idea that His Majesty's Office of Works were going to make a new road right across the Green Park. That would be a very important new work, which could not be done until it had been sufficiently considered, and which would not be done surreptitiously. So far as he knew there was no intention—certainly not in connection with the late Queen's Memorial—of cutting a new road across the Green Park.

MR. HENRY T. HARE, President of the Architectural Association, seconded the vote of thanks, remarking that the address had been concise, clever, and instructive. Into the question of registration, which had been dealt with most exhaustively, and which was still a burning one among architects, he did not propose to enter. Strong arguments had been advanced against the Registration Bill, but there could be no doubt that the state of affairs which had awakened this agitation for registration was a lamentable one, and, personally, he felt much sympathy with those who had promoted the Bill, although he was not in entire accord with that measure. The most important topic broached was the question of the control of the design of public buildings—one of the most serious questions in all large cities. It was highly gratifying to hear that the First Commissioner of Works had accepted and endorsed the proposal; and he was glad that a man of such broad and sympathetic feelings towards art as Lord Windsor should have been placed at the head of that department. No one who had travelled much could fail to realise the different attitude of the Government towards architectural art in this country as compared with that manifested in France, Germany, and the United States. A broad-minded scheme of improvement was, in the long run, the most remunerative, as Paris had proved during the past generation. As their most distinguished Past-President, Mr. Aston Webb's sympathetic allusions to the educational work of the Architectural Association must be highly gratifying to all its members. The Institute and Association had for years been drawing into more intimate relations the one with the other, and it was possible that the A.A. day-school, under the new conditions, might ultimately supersede the present pupilage system.

MR. REGINALD BLONFIELD supported the vote of thanks, remarking that he could not agree with Mr. Hare that the control of public buildings was the most important topic of the day, but the education of the young architect. The day-school system, so successfully instituted by the Association, needed to be supplemented by the training of the student in an architectural workshop, or rather laboratory, so that the future architect should understand the capabilities of the materials he was to specify, and be given opportunities for research into constructive problems, a point that had been practically disregarded since the days of Wren.

The vote of thanks was carried by acclamation, and was briefly acknowledged by the President.

REINFORCED CONCRETE.

A NOVEL mode of reinforcing concrete beams, lintels, and window-heads is described by Mr. Julius Kahn, C.E., Assoc. M. Am. Soc. C. E. The author speaks of the value of vertical reinforcement for beams, as we find it introduced in the Hennebique system. This is evident from the failure by shearing at the ends. The writer has made several tests on beams reinforced with plain and deformed rods on the bottom, and without exception, all such beams, when tested to destruction under uniform loading, failed by vertical or longitudinal shear in the manner pointed out by Captain John S. Sewell. The article to which we refer, printed in the *Engineering Record*, has diagrams showing lines of tensile stress, which is one of variable curvature from bottom of beam to the top—a theory advanced by the late Professor Rankine. Diagrams are given showing the truss action in a beam, flat arch and lintel, and the method of introducing the steel rods. These lines of tensile stress indicate the principle of reinforcing the beam. Being weak in tension, a concrete beam would open at right angles to these lines, which had actually occurred in the tests. The stirrups introduced by some engineers are very useful, as they cross the lines of rupture at an angle, and tend to hold the material together. They should, however, be placed on a beam in a direction inclined to the horizontal, so as to lie close along the line of principal tensile stress, for they then cut the line of rupture at right angles, and therefore assist to hold together the concrete where it has a tendency to open. The fundamental principles of this type of reinforcement are stated:—(1) "Concrete should be reinforced in a vertical plane as well as a horizontal one; (2) the reinforcement should be inclined to the vertical preferably, with varying upward curvature approximating the line of principal tensile stress; (3) the metal should be distributed in proportion to the strains existing at any place; (4) the shear members should be rigidly connected to the horizontal reinforcement steel. The author has tried to accomplish these results by taking a bar of square cross section, placed diagonally, and shearing upwards into an inclined position, the web on both sides of the main bar thereby forms substantially the tension members of the Pratt truss. When such a member is imbedded in a body of concrete the latter unites firmly with the steel, and the combination of the two forms a trussed beam wherein the tensional members are of steel, and the missing compression members supplanted by the concrete." But we leave the reader to study Mr. Julius Kahn's remarks. One sentence may be quoted as conveying the principle in a practical manner:—"As soon as a load is applied on top of the beam, the concrete tends to arch itself, and a series of internal arches immediately set themselves up within the material, each arch finding its abutment in a set of prongs, for which the bottom chord acts as a tie. The prongs receive the weight, and carry it upwards, distributing it on the other arches of larger span, the horizontal reinforcement serving as a common tensional member." This tensional member may practically be placed outside the concrete, the strain it receives being largely the horizontal components of the inclined members. Several photo. illustrations show the trussed beams for testing and the failure of concrete-steel beams, with longitudinal rods only and trussed in the way described. The subject is one of great interest to all engineers and architects engaged in reinforced concrete. The theory is the same as that involved in a trussed beam, and the introduction of steel bars to take the stresses which theory has propounded will enable the architect to design forms of concrete capable of carrying heavy loads. We are yet only at the threshold of this mode of construction, though the principles are clear.

THE BACTERIAL TREATMENT OF SEWAGE.

AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, Nov. 2, 1903, Mr. J. Patten Barber, President, in the chair, a paper was read on "The Bacterial Treatment of Sewage," by Mr. George Thudichum, F.I.C., F.C.S., and of which the following is an abstract: The author prefaced his remarks by stating that the extensive experiments which had been carried out during the last seven or eight years by various authorities had yielded results very

gratifying to those who had first introduced bacterial methods. The principle that sewage could, in the large majority of cases, be purified by biological means alone had now found practically universal acceptance, that being indorsed by the Interim Report of the Royal Commission now sitting. He pointed out that, that being so, there was no longer any need to argue as to principle, but the best methods of application might still be discussed with advantage. The two main points which were still being argued were (1) the relative merits of the anaërobic or septic, as compared with the aerobic, or coarse-grain contact system; and (2) the various ways of applying the effluent, from the preliminary treatment to the finishing filters.

The author then proceeded to discuss the first point, and after setting out the arguments *pro* and *con*. at some length he finally gave it as his opinion that the anaërobic process was more in accordance with the teachings of nature, and, moreover, possessed certain specific advantages over its rival, such as the averaging of the sewage flow, the greater ease with which regular periodic working of the filters could be obtained, the absence of trouble from loss of water capacity through deposition of solids, and the easier and cheaper cleansing, if necessary. The necessity for covering a septic tank was then dealt with, the author stating that he thought it desirable, since it prevented disturbance of the bacterially-active scum, avoided risk of nuisance, and enabled use to be made of the gases evolved during the putrefactive process, as was actually done at Exeter. As regarded the question of the best method of applying the primary effluent to the secondary beds, the author hesitated to express an opinion, since excellent results had been obtained by either method, and the evidence available was not yet sufficient to enable a definite verdict to be arrived at.

The author then discussed the question of sea outfalls, and the possibilities of pollution of shell-fish by sewage or sewage effluent. He thought that in some cases the standard demanded was too high, and suggested that reasonable safety was all that should be asked for, since absolute safety was practically unattainable. The author concluded by pointing out how the present methods of sewage treatment had been gradually built up, tracing the growth of the so-called Sutton system from its early commencement to its maturity.

SEWAGE DISPOSAL AT OSBORNE.

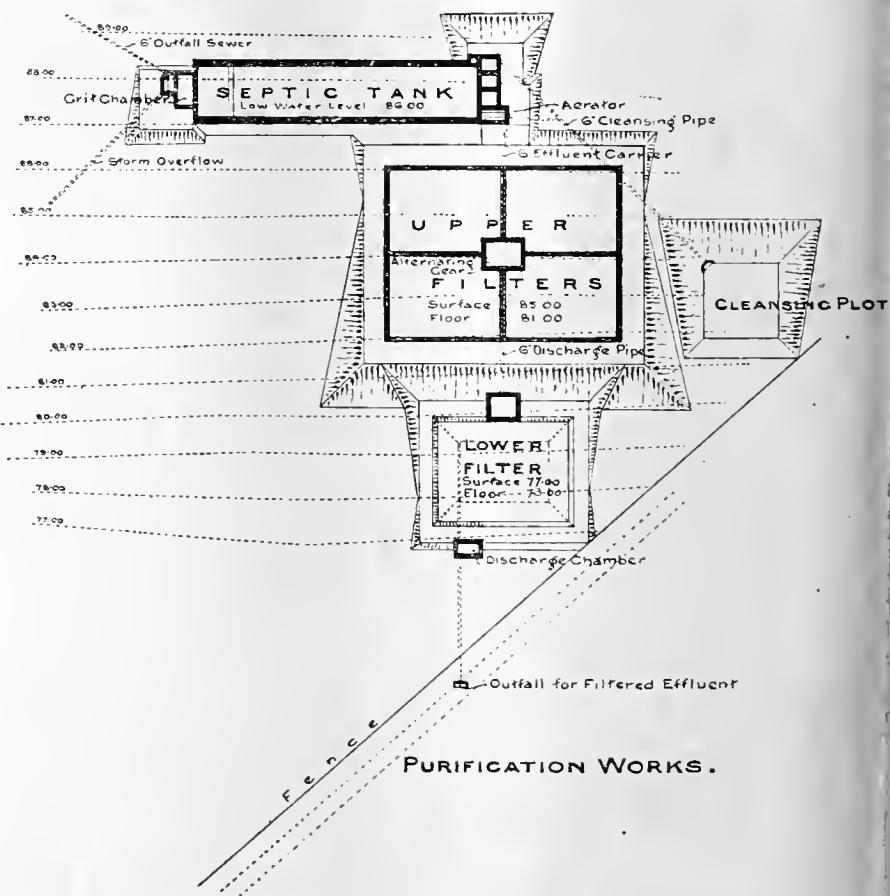

THE progress which sanitary science has made during the past half-century is well illustrated by the contrast between the drainage arrangements which were in use at Osborne down to a few months ago, and those which have been installed in connection with the establishment of the Royal Naval College, which was opened by the King in August. The late Prince Consort did much to draw attention to the need for proper means of dealing with sewage, and it is certain that on the building of the Royal residence at Osborne (close on sixty years ago), the drainage of the house received its due share of attention at his hands. It may, therefore, be taken as representing the latest development of sanitary science at that time. It is hard for the drainage engineer, amid the profusion of excellent sanitary appliances at his command to-day, to realise under what conditions his predecessors had to work in the year of our Lord 1843. In those days, be it remembered, stoneware pipes were not known. The main outfall drain, by which down to the last month the whole of the sewage of Osborne was carried off, is an 18in. barrel built of common bricks. It is comforting to reflect that the gradients were good, and that the outfall drain was effectually trapped off from those around the house. The sewage was originally discharged into the sea, but was subsequently intercepted and diverted by a pipe-drain into what was known as the "manure tank." This tank consisted of three compartments, built end to end, each being 15ft. long and 6ft. wide, and containing two tiers of wooden gratings, on which a layer of sandy soil was spread. The sewage was admitted at the bottom through a 9in. pipe, and rose successively through the three compartments, in which the solid matter was retained. The clear water rising to the top of the tank was carried off by a pipe which ran on a contour around the hill, and eventually found its way to the surface through a series of "weep" pipes. This system, with slight variations, is in use to-day at scores of

mansions throughout the country, and previous to the discoveries of the last few years a country gentleman had no better means at his command for disposing of the sewage of his house. The works appear to have met the requirements of the time fairly, the long absences of the Count from Osborne having afforded the land the rest which it needed between successive dosings with the sewage.

Such was the state of things down to the

drainage of the College and the overhauling of the drains of the house being entrusted to Messrs. Doulton and Co., of Lambeth S.E. The work of construction was put in hand towards the middle of June, under the direction of Mr. E. G. Rivers, M.Inst.C.E., chief engineer of His Majesty's Office of Works. The Septic Tank Company's operations commenced at the intercepting chamber immediately in front of the house at the head of the brick-barrel above

spring of the present year, when, in view of the large addition which the College was expected to make to the resident population, His Majesty's Office of Works decided to lay down an up-to-date system on a scale commensurate with the work to be done. The Septic Tank Company, of No. 1, Victoria-street, Westminster, S.W., was accordingly called in to deal with the sewage, the

referred to. From this point a new 6in. sewer with gradients of 1 in 75, 1 in 34, and 1 in 24 was laid in a north-easterly direction to the position chosen for the purification works. The sewage is thus carried out of the valley running down from the house to the sea into another small valley to the north thereof, the site occupied by the installation being close to the southern margin

SEPTIC TANK INSTALLATION FOR OSBORNE HOUSE.

of the Pier Wood, about 400 yds. above high-water mark.

The purification works, which are shown in the accompanying plan, comprise a covered septic tank and four aerating bacterial filters, all built in concrete, and a single low-level filter formed in the ground. They are designed to serve 550 people, and to deal with a wet-weather flow of 33,000 gallons per day. As is usual in the Septic Tank Company's installations, storm flows exceeding this rate, but of short duration, will be wholly dealt with in the purification works; but

inlets into the septic tank, which is 55 ft. long by 10 ft. wide, and 6 ft. in average depth below the springing of the roof arch. The effluent is withdrawn by a submerged slotted pipe into the effluent-chamber, from which, ample fall being available, it passes over an aerator on its way to the high-level filters. Each of these is 22 ft. long by 16 ft. wide, and is filled to a depth of 4 ft. with furnace clinker broken to gauge and freed of dust. They are filled and emptied in the original Exeter cycle, each filter in turn remaining full while the next is being filled. The work is automatically controlled by the company's central basin gear, which, as shown by the photograph, is entirely self-contained, and therefore beyond the possibility of derangement by errors in setting the various parts.

As the effluent from the purification works will during the greater part of the year constitute the whole flow of the ditch which receives it, and will run down over the beach into the sea, it was decided to subject it to a second filtration. A low-level filter, 20 ft. by 20 ft., at the surface and 1 ft. deep, has accordingly been laid down, and the effluent from the upper filters, after passing through a receiving-chamber which takes up the first rush of the discharge, is showered on to it from two lines of perforated cast-iron pipe. The alteration in the spread of the jets, due to the variation in the head on the orifices, enables a good distribution of the effluent to be secured with fixed distributors—an important advantage in a small installation, where the flow cannot be relied on to work a rotary distributor satisfactorily. The effluent from the lower filter passes down a slope of white glazed bricks into a ditch close by.

The structural work has been excellently carried out by Messrs. Smyth, White, and Co., Ltd., of 25, Victoria-street, Westminster, S.W., under Mr. A. Thomson, the resident clerk of works at Osborne, and the installation is in every respect a good example of an up-to-date sewage purification works.

ELEMENTARY NOTES ON THE SUPERVISION OF BUILDINGS.*

By C. F. INNOCENT.

ALTHOUGH I believe some architects consider the supervision of buildings rather beneath them, it is, in my opinion, very necessary if the buildings which the architect designs are

* A paper read before the Sheffield Society of Architects.

to be carried out in accordance with his ideas, and without such supervision variation either by accident or design is inevitable. While we have in Sheffield many tradesmen who may be trusted to carry out work both honestly and well, and who would prefer to do good work rather than bad, the present system of adopting the lowest tender is an inducement to contractors to obtain work by cutting prices, and profits have then usually to be made at the expense of quality in the work; of course, in some cases the builder may see various ways of cutting prices without lowering the standard of the work. It is with inferior builders that this paper is chiefly concerned. Let me urge upon any pupils here the importance of getting on to works in progress as much as possible, as this is the way to obtain a practical knowledge of construction: textbooks and building construction classes are all very well for obtaining theoretical knowledge; but they leave untouched a great many matters upon which you will have to be informed if you are to make efficient superintendents of buildings. If your principals would allow you to visit a building from the commencement to the completion—say, every day or every alternate day—to act, that is, somewhat as “clerks of the works,” you should be greatly benefited, provided, of course, that you have kept your eyes and ears open. It will greatly help your understanding of the working and detail drawings, which in their varied colours appear at first so incomprehensible, if you go over the building with them, and study their relations to each other. The person with whom you will have most to do while on the works is the foreman, and it is well for you to remember that he is placed in his position by the builder to look after his (the builder's) interests. One way in which he can do this is by a pleasant and obliging—sometimes only apparently obliging—bearing towards the architect and his staff, and you will usually find the foreman very easy to get on with. Much useful information can be learned in conversation with an experienced foreman, and also with the better class of workmen, such as the joiners who are “staircase hands” and the masons who set the ashlar. And the conversation of workmen among themselves is quite as informing, though in a different direction. The workmen are usually pleased to have their work noticed; but you will hear curious ideas from some of the men, and have to exercise your powers of discrimination. Your interest in the work, if pleasantly shown, will benefit both yourself and the building, and I think it quite allowable for you to help the builder in various

AUTOMATIC ALTERNATING GEAR.

in case of a continued heavy downpour the surplus will escape over a fixed weir. The main outfall sewer discharges into the grit chamber, which is 6 ft. long by 3 ft. wide and 3 ft. deep. From this chamber, the sewage, which is not screened in any way, passes through two special submerged

little ways, without laying yourself open to charges of collusion with him, such as by pointing out a workman who is slack, or by suggesting an improvement in the length of the ladder or barrow runs. If you should be set, as I have advised, to look after work, the foreman will soon take your measure, and if he thinks you are a likely fellow for it, will try to persuade you to alter all sorts of things—of course, to improve the work. Such, for instance, as the benefit to be derived from the substitution of lia lime for cement in concrete, and if you are green enough he may make such substitutions without saying anything to you about them. Things will go more smoothly if you always stick pleasantly and firmly to your first decision. If you know that you are right, take no notice of the builder's objections that such-and-such ways are unnecessary fads, and that Mr. So-and-So always has it done in some other way. Everyone hates shilly-shally and indecision as to how things are to be done, and more particularly so in the disapproval or approval of work and materials. You will find it best to show at the beginning that you mean to have everything done well. Whilst on the subject of foremen, I would remark that some builders have an inconvenient habit of moving their foremen about from work to work. This will cause you a great deal of trouble, and should be objected to. In condemning materials you will, of course, order them to be removed from the site, and if you are wise you will see them go. Unless this is done it is so easy for an unheeding workman to use up the stuff—of course, quite by accident. If you do not see them removed, you should, at any rate, thoroughly remember their appearance, and, if possible, plainly mark them as disapproved. Perhaps I can best illustrate what I mean by an anecdote. A Sheffield architect had to build a wall round what may be called a place of worship, and determined to make a good job of it by specifying Greenmoor stone coping. The builder, however, substituted a much cheaper and softer stone, in which there are patches of a lighter colour. He then sent for the architect to approve the work. However, instead of approving he disapproved, and the builder admitted that it was scarcely up to the usual quality of Greenmoor, and he promised to get a fresh lot of better quality; but when the architect had gone the patches were cut out and the old coping duly refixed. Again the architect was sent for, and was pleased this time to express his decided approval. The builder was paid for Greenmoor, everybody concerned was satisfied, and what more could be desired? That builder has now retired with the reward of his commercial enterprise, but the architect is still in practice amongst us. This story was told to me by a foreman, and it is significant that he looked upon such "extremely dexterous" conduct as a good joke! I believe that some undesirable builders consider that the disapproved material is removed if placed upon another part of the site. At least, I have heard a tale which implies this, concerning a Sheffield architect, whose large and successful practice was only ended by his death. He condemned a quantity of timber on a building, and ordered it to be removed away; but the builder took counsel with the clerk of the works, and annointed him with palm-oil. The timber was then put on another part of the site, the stuff was sorted according to quality, and the worst carefully put at the bottom and the best at the top. When the architect next came round, the clerk of the works pointed out the excellence of this new timber, and the architect approved of it as most desirable stuff! But all this happened years ago, and we know that with other men come other manners. When the builder assures you that the materials are the best, he may be correct in the letter but wrong in the spirit, as "best," used as a trade term, does not always bear its recognised dictionary meaning. The "best" in some materials may be of quite medium quality. I hope that it is not necessary to warn you against ever taking anything from a tradesman which malice or suspicion may interpret as an illicit commission. I would carry this to the extent of not allowing your tram fare to be paid, small as that is. The position of the architect is such that he cannot be too careful of his conduct in such matters. If you have to do with builders in the country, where manners are (shall I say?) more unsophisticated, they will possibly invite you to accompany them to the nearest publichouse. I trust that you will risk offending them rather than do anything so unprofessional. While I am speaking about the country builder I

would remind you that you will hardly obtain workmanship from him with the finish that you expect here in town, although the work may be substantial enough. This is because the best workman will not work in the country owing to the low wages and so-called dullness. In work out of town where the builder is unable to drop into the architect's office whenever he wants to ask a question, it is almost a necessity to adopt a regular day for inspection or to inform the builder beforehand of your visit, and I believe that some architects adopt this practice with their work in town; but it is in such cases, in my opinion, of questionable utility, as it always enables the builder to have everything on the work ready for your inspection as he wishes you to see it, and it has the disadvantage also of allowing the large force of men whom he has put on the work to gladden your heart on your visit of inspection to be transferred to another job when you are safely out of the way for a few days or so. Visits at all times and any time are the best way to keep everyone on the *qui vive*. You know that as soon as the labourer, who is mixing mortar or loading up bricks in the road, sees you bearing down on the job he goes inside and shouts up to the scaffold that so-and-so, whatever your name or your nickname may be, is coming; the word is passed round, and by the time that you have climbed upon the scaffold the bricklayers who have been laying the bricks nearly dry, except on the face joints, are laying them as carefully as eggs; and the masons who have been packing their walls with little stones without a scrap of mortar to cover them have flushed them all up in what seems a most satisfactory manner, until you poke into it. It is, I suppose, natural to everyone to go the easiest way, and you will have an early example of this when the stripped soil of the site has to be tipped. You will find most excellent reasons produced for wheeling it down-hill. I think when you pay a visit to a building for the purpose of supervision, that it is as well to go round by yourself, and not be led round by a talkative foreman. In such a case I sometimes feel that work is being smothered up on another part of the building while he is engaging me in conversation. Of course, it is a different matter if you go to learn what you can from him, as suggested before; and I may say here that it will be as well to ascertain from your principal what is your standing on the work. No doubt you will realise that the condemnation of work or materials by an inexperienced pupil sometimes places the architect in a position in which it is necessary to let the pupil down. It is obviously impossible for me here, even if I had the knowledge, to describe the numerous probable defects in the various works and materials in a building, and it is done far better in such standard works as Seddon's "Builders' Work and the Building Trades" and "Notes on Building Construction." There have also been various excellent series of articles in the architectural papers. There is one point, however, which I consider does not meet with adequate consideration in the textbooks: that is, the correct order in which the different trades and operations follow each other. These are known well enough to the builder; but he does not always act up to his knowledge, but sometimes, if permitted to do so, only considers his own convenience. For instance, he may build the walls in one part of a building before those in another part, with unequal settlement as a possible result, or he may rush the concrete floors on while a shower of sawdust is descending from the joiners' working at the roof, thus weakening the concrete; or the joiner may bridge or strut the joists as soon as they are fixed, so that the fastenings are strained with each swelling and shrinkage of the timber, or a labourer with nothing to do may be set to sweep up the rubbish while the painters are varnishing, thus producing a fine frosted effect without extra charge; or various works may be delayed, perhaps, in the hope of slipping them altogether. On the contract work each tradesman usually wishes to change his men about as little as possible, to keep them at regular work, and to go straight forward, and get as much work finished as is possible at one time. I will now run through such other matters in the work requiring your attention as occur to me. As to the commencement. Some architects set out the work themselves, and others refuse to do so, but check the dimensions over after the builder has set out. This is necessary, because you will understand what a saving an unscrupulous builder would effect if he were to pinch 2½ in. or 2 in. from each dimension of each room.

The rooms should also be tested to see whether they are square. Whether the walls are at right angles may be easily tested with the measuring-tape, if you remember that the sides of a right-angled triangle are in the proportion of three, four, and five, and, of course, their multiples. The heights of the rooms should also be tested as to their correctness. You are not likely to be troubled much in Sheffield with bad foundations, though here and there there are quicksands. The pump and concrete are a necessity in such cases. We have, however, plenty of clay in Sheffield, and as it is liable to swell with wet and contract when dry, with unpleasant effects to the building, you should have the "footings," as they are called, got in before rain gets to it. If the "footings" are of rubble it is necessary to see that they are well bedded on the foundations, and well compacted together. Poor footings lead to cracks in the superstructure afterwards. While speaking of the foundations, I would remind you that they are occasionally omitted in places where the building inspector can be squared, or where the building inspector has not yet put in an appearance. I recently had to inspect a house in the South in which the builder had omitted the foundations. But the value of foundations is somewhat exaggerated, as the tower and spire of Rotherham Church stood for about four centuries practically without foundations. In any case you should be sure that the foundations are of a proper depth, and keep a memorandum of it. When the drains are laid the labourers very often start to ram the filling as soon as the first portion is thrown in, with cracked pipes as a possible result. This should not be allowed. It should also be seen that pipes are clear inside, especially from cement ridges: in places where there is much filling, water from a hose may be used with advantage to supplement the rammer. The mortar is a most important ingredient in a building, and as the builder naturally dislikes to waste any, the spare mortar a day or two old very often is reworked up and used in the work; as its setting powers are thus impaired, this is not satisfactory, and you should watch and prevent it: good mortar ought to feel greasy between and dry limey on the fingers. A builder's rough test for mortar is to take some up on a shovel and turn the shovel over; if it runs off easily he considers that it is of good quality, and *vice versa*. Poor mortar which, owing to the too great proportion of sand, works stiff, is wetted in practice to make it work more easily, and it is then deceptive. The waller finds mortar with poor sand—that is, loamy and clayey, most easy to work with. The lime used for mortar should be in lumps, which ring when struck together. If it is soft or fallen into powder, it has probably been rained upon or slaked by the moisture in the atmosphere, and should not be used for mortar. In mixtures where lime or cement is an ingredient there is a tendency, owing to the greater proportionate cost of these materials, to put in a less quantity than specified: and whether you have doubts or not, it is advisable to personally watch over the mixing; especially of concrete, where the strength may be of importance. The proportion of cement may be reduced under your very eyes by the labourers putting the box for measuring the cement on to the heap of stones and sand and knocking it down, thus forcing some of the stones up into the measuring box and reducing the amount of cement. Mortar should not be allowed to set, or rather to dry, too fast, and in hot weather the bricks should be well soaked in water; such a wet brick is heavier and harder to the bricklayer's hand than a dry brick. Concrete is also not improved, but the reverse, by drying, as may take place with floors in windy weather, and such concrete should be kept damp until it has set. You will, of course, see that the bricks are properly bonded, especially at angles, in reveals and jambs, and in piers: a well-bonded brick wall is much more satisfactory in appearance to the eye than one in which the joints are not perpendicular and the bricks are cut about. In this respect the old 18th-century brickwork, where the piers and openings are all multiples of a brick, is superior to much modern work, where the piers and openings are set out on a drawing to a scale of feet and inches, and the bricks have to be cut to fit it. In the walling of flues there is a matter which ought to be carefully attended to: I mean not to "throttle" them, as the builders say, as this is one of the most usual causes of smoky chimneys. Particular attention should be paid to the flues at the bends, to see that they are kept large enough. As the necessary

bends themselves impede the smoke, you should see that the men in walling do not make them smaller at the angles, as they have a habit of doing. Interior workmen are very careless about keeping woodwork or steel joists properly away from flues and fireplaces, and as many fires are due to this cause, you must carefully guard against it on buildings over which you exercise supervision. There are still builders in this district who lay the joists, then build the flues around them as they come, and afterwards the pieces of joists which run across the flues are cut off, leaving the ends of the joists exposed. The defective filling in of the backs of stoves, and careless springing of the flues are other frequent causes of fires, and should be avoided. You will have learnt that stone should be laid in the work upon its natural bedding plane—"quarry bed" as the builders call it. Much of the building stones used locally are somewhat micaceous sandstones, in which the tiny white mica spangles are bedded parallel to the plane of deposit—i.e., the "quarry bed." If this is not possible, a good way of ascertaining the bed of a stone is to douse it with water. The beds worked by the mason require your attention to see that they are level, and of full size; otherwise pieces may flush. It is rather expensive and troublesome sometimes for a builder to replace a piece of ashlar which has got chipped or otherwise damaged, and it is possible for him to patch it up very neatly and inconspicuously with cement, and I understand that very up-to-date masons stick the chip on with shellac and sand the joints, all with unfortunate results later on. You should keep your eyes open for this. Some inferior builders, in order to save scaffolding on the work, only put it up on one side the wall. This necessitates what is known as walling "overhand," and should be objected to, as it is almost impossible to plumb up the work properly. Of course in some cases this one-sided walling is necessary. You should regularly plumb the walls, as walls out of plumb are unsightly and may be unsafe, and are impossible for the joiner and the plasterer to make a good job of. Another point to guard in walling is to see that the scaffolding is raised in easy stages for the wallers. Some men neglect this to the detriment of the walls. These are little ways in which the builder may effect savings, which keep money in his pocket, and add, of course, to his balance on the right side. Other such occur in all trades, as in the Carpenter for instance, as giving all the bearing timbers, as lintels, an inch or so less of bearing at each end, or by making the roofs of a flatter pitch than shown on the drawings, which is an easy dodge in a hipped roof, or by setting the joists of wood or steel an inch wider apart than taken, or by systematically omitting one joist in each room;—such omissions all add up. I remember a building on which I counted the joists, and found that the builder had effected a considerable saving by systematic omission in this way. However, his ingenuity was duly noted at the settling up. You ought to see that the amount and quality of work required by the contract, for which your principal's client is paying, are put in the building, and more particularly in those parts which will afterwards be hidden, such as the foundations and the correct number of the ceiling joists and spars. It is quite possible that a bill for extra work in such inaccessible places may arrive at the conclusion of the work, but the question of payment for extras is beyond the scope of this paper. The ordering of extras is important, and I must warn you to be careful of what you say, as builders sometimes put their own interpretations on your innocent expressions of opinion, and when the bills come in, and your principal asks the builder who ordered such and an extra, the builder, looking in his pocket-book, says: "Oh, your Mr. So-and-So ordered on such a date." The result may be unpleasant all round. It is best for the builder to understand that the architect alone can order extras. I have previously pointed out the importance of seeing work carried out, and I would here point out the importance of getting round the builders' shops, in addition to the building itself, as without a good acquaintance with workshop practice you will hardly be able to draw workable details. I have seen sections drawn for local sandstone, which could only be worked in wood, or perhaps in marble, and every builder has tales of impossible details which came out of architects' offices. Not only are such visits to shops desirable for the acquisition of knowledge, but they are necessary in the case of joinery, as

the first coat of paint, known as the priming coat, is usually put on in the joiner's shop, and all kinds of defects may be covered up if not seen before being painted. The principal points to notice in the joiner's work at the shop are the quality of the timber (especially as to sap and seasoning), bad joints, and the omission of labour, as in grooving and rebating, and to see that the framing is square and not winding on its faces; and, if detail drawings have been used, to see that the work as regards mouldings, framings, panels, &c., has been carried out in accordance with them. The quality of timber gets poorer as the years go by, and as the old forests round the Baltic are cut down, much of the inferior stuff, with its large annual rings, quickly grown in a crowd, and, therefore, soft, which is now sent over, is no doubt inevitable. But it hardly justifies the sweeping statements of some joiners that there is no good wood to be had nowadays. They may be reminded that there is as good fish in the sea as ever came out, if they care to buy it. The BUILDING NEWS has lately had an interesting series of articles, illustrated by sections of random samples of various timbers with the sapwood blacked in. The places where things are most likely to be forgotten, as I will put it, are those which are dark and difficult of access, more especially the roof. I would urge you to climb up and see whether the spars and purlins, and the other timbers are all properly spiked together. There is a roof into which I had occasion to climb up some little time ago. It has a ventilator on the ridge, and the rooms underneath have ventilating doors in the ceilings; but there are no connections between the doors and the ventilator. A little wholesome exertion on the part of the architect would have rendered this impossible. Careless supervision, like murder, will out, sooner or later, so that it is to your own, as well as the client's, interests in the long run to see that all is right. A client usually notices things which, though structurally unimportant, render, if not rightly built, the "very very pretty house" desired by some people, unobtainable, and they should be carefully attended, however small they seem. Examples of such points are the qualities of paint and varnish, the centring of fireplaces and windows in walls, the fitting of window sashes, and the squareness of joiner's work, irregularity in which interferes with the correct fitting of wallpaper patterns. In setting out, joiners work up to eighths of inches, but consider sixteenths of inches as infinitesimal. Bricklayers and masons do not expect to take into consideration less fractions than half-inches. The roof coverings require careful watching if you mean to have a satisfactory job made of the roof, and I have somewhere seen that an architect is never forgiven for a smoky chimney and a leaky roof. Slates from the better-class quarries have not been very easy to get hold of lately, and, unless you early bestir yourself, you may be driven to accept inferior slates. Of course you will understand that with materials that have to be obtained some time before they are used in the building, there is sometimes a likelihood, owing to financial reasons, of the builder using them for other jobs before yours is ready for them, and this, unless prevented, may prove awkward for progress and good building. If the slates are to be to sample, it is as well to make sure that they are so. This, of course, applies to all other materials to sample, especially the bricks and the Joiners' ironmongery. As the Slating is only a small trade, I propose to consider it more completely than the others, as a type of the supervision required for all trades. The first thing to look to is the quality of the slates. They should be both hard and tough, they should have a metallic ring when struck with the knuckles, and should not fracture easily when lightly struck against wood; if water poured on the slate is soon absorbed the slate is, of course, porous; slates with friable and splintered edges are generally bad; slates with green blotches in them, though the blotches do not affect the weathering qualities, are, by reason of their objectionable appearance, about £1 per ton cheaper than plain slates. Slates get shaken in their railway journey here, and if not properly packed a jolt in shunting a railway truck may sometimes crack the slates from end to end of the truck. The slater ought to test every slate for soundness before holeing it, and this he does by striking in on a bar in front of him, or by sharply tapping it with a hammer. Cracked slates, however slight the cracks are, should not be put on, as frost is sure to crack them. The holeing of the slates fixes the lap, and this is one of those

cases where a squeeze of £10. will put something in the contractor's pocket. The nail holes should not be so large that they will draw over the nailhead. In holeing, the slate sometimes breaks around the holes, and the slater, if not stopped, may turn the slate round and hole again. No slates which are broken or much chipped should be allowed. The labourer may so hole the broken slates that the broken end is hidden, when laid, by the upper slate, and there is then only one thickness of slate covering the roof at that point. The laths should be free from sap, and nailed to every spar. The roofs should be lined over before lathing, and any spars which are down or appear likely to sag should be attended to. The slates should, of course, be slightly tilted towards the roof at a gable unprotected by a coping, and the spars firmed out. Before laying, the slates, if in the least uneven, should be sorted into thicknesses, so as not to be laid at random, and any slates which are twisted should be rejected, as such slates will certainly ride, although the slater sometimes says: "Oh, they'll be all right; we put the flat side downwards." Of course, the heavier, and in Westmorelands, the larger slates should be laid at the bottom; the double-eaves course is sometimes slipped, and if it is not, the two bottom courses are sometimes nailed to a single lath. The nails, if expensive, as copper nails, are another point where the slater may try to save something if so disposed. Sometimes you will find nails of two weights on the job—one as specified, and the other lighter. I confess that I offer no explanation of this, and fear that you will not obtain a satisfactory one from the slaters. The nails should bulge out somewhat in the middle, to get a firm hold on the lath. The points of the slates should be vertically over each other, for the sake of appearance. Occasionally there is a tendency on the part of the slater to delay the pointing of the slates until after the ceilings are plastered, on the principle, I suppose, that what is out of one's sight is out of one's mind. The pointing mortar should be haired, or it will not stick to the underside of the laths, and some slaters do not put the hair in unless supervised. It is also a trouble to the men to get cement mortar specially to point the verges, and ordinary lime mortar will be used if you are not careful. The ridge tiles should be set and pointed in cement mortar, and, if flanged, the flanges should be away from the south and west to avoid giving a purchase to the gales from those quarters. The angle inside the ridge should be less than the rake of the roof, in order to grip it more firmly. I have entered into the slating in this detailed manner as an example to give you some idea of the multitude of little things in all trades which have to be seen to if the work is to be a credit to yourself and a satisfaction to the owner. I have already advised you to keep your eyes on the mixing of the plaster, and need not say more on the subject, except that you should satisfy yourselves that the lime is well slaked. Sometimes the plasterer finds it easier to fill up a space by laths in a different direction to the rest. The plaster at such points will possibly crack, so that you should not allow him to do this. Plaster on laths should be well "keyed"—that is, squeezed between and behind the laths. I have had it explained to me by a plasterer, where the key on some stoothing was absent, that key on lathed upright partitions was as unnecessary as on walls, as there was no pull from the plaster as on ceilings; but that plasterer did not make a convert, and I name the incident as an example of the numerous good reasons for doing bad work which are constantly being brought forward. It is surprising how monotonously sap and other defects in laths are declared to be "only a little stain." Of course, in some cases, what at first looks like sap proves, on closer examination, to be only surface dirt. You will find a source of considerable trouble and annoyance in the independence of some trades and the ignorance of some workmen. I refer to such matters as the cutting of bearing timbers by plumbers and gasfitters and their kind, who will, unless you warn them beforehand, chop right through your bearing timbers without compunction if it suits them to run their pipes in such ways. The Plumber is such a monster in the popular imagination that you will be pleased to find him, on the whole, neither better nor worse than his fellow tradesman. However, should he be so inclined, his opportunities for taking advantage of you are many, especially in the lead in gutters, flashings, &c., and which should, of course, always be tested for size, lap,

weight, and fall, as all of these are liable to be skimmed; and, as the plumber is able, when cutting the lead, to give a twist with his knife which thickens the edge, it is better not to rely on the lead gauge, but to weigh a bit of the lead, and calculate the weight therefrom. The eaves, gutters, and down pipes should also be inspected for correct and even thickness. The Painter's trade is one of the most difficult for the architect to exercise supervision over the materials, and I recommend you to make a study of these. It is well to have each coat of paint of a different shade. Of course, the variation need only be slight, but if you see each shade on everywhere you know that all the coats are on. This refers more especially to the constructional steelwork, where a coat is often slipped. We have all heard of people who couldn't open a single window when they went into their new building, and couldn't get the architect to attend to it for three days; and before the client occupies your building I advise you to go round and see that the sashes are not stuck with the paint, that the window-fasteners work properly, that none of the keys are missing, that the damaged slates are repaired, that the eaves gutters are clear of rubbish, and, not least in importance, that the w.c. cisterns are in working order, and other little things of a like kind, which if left imperfect make a new building unpleasant for its occupiers, and may lead to accusations of neglect on the part of the architect.

HIGH-TEMPERATURE REFUSE DESTRUCTORS.

THE disposal of refuse formed the subject of a meeting held on Friday night in the Geographical Institute, Newcastle. Mr. F. J. Edge, city engineer of Newcastle, presided, and a lecture on the subject was given by Mr. W. F. Goodrich. The chairman said the subject was extremely important. He was glad to see that in the subject "refuse disposal from sanitary and commercial standpoints" the sanitary was given the first place, because refuse disposal should be first of all considered from a sanitary standpoint. He did not like the expression "commercial standpoint." He would like Mr. Goodrich to tell them about refuse destructors that had been erected adjacent to residential property, and whether there had been any complaint. The modern type of high-temperature destructor ought not to be a nuisance at all. He would wish Mr. Goodrich to give them also some information about the different methods of destruction. He would like to know something about the results where the heat was not utilised at all, where a partial use was made of the heat, and where the whole heat was utilised for motive power. Mr. Goodrich said the destruction of refuse by fire was accepted as the most efficient and sanitary by modern science. In London thirteen of the Metropolitan boroughs had refuse destructors, and the other fifteen got rid of their refuse in various ways. He described the method of hand-sorting at depots, which, he said, had many objections from a sanitary point of view, the operation being carried out largely by women, who stood up to their waists in filth. Much of the refuse was sent to the sea in barges, and to this there were sanitary objections, as it might be returned by the tide. Much of it was sent to tips, and the odours from the accumulated tons of refuse were very offensive. In several towns destructors consuming refuse by fire existed in central situations, surrounded by good houses, and there was no complaint at all. There were no offensive gases, and the dust was all collected inside the destructor and was not allowed to reach the outer air. He contrasted the old method of burning refuse in cells at a temperature of 700° with the modern high-temperature method, with forced draught and regenerators at 2,000°. Describing the destructor at Fulham, which was used with an electrical plant, he stated that 26·62 units of electricity were produced per ton of refuse burnt. In addition to that, the clinker was used for making bricks and flags. At Sudbury they not only pumped the water, but found that the clinker made the best filtering material. At Ipswich the refuse destructor was to be used for producing electricity for lighting and traction; and at Lancaster they had a surplus, in the same way, of £1,353. At Llandudno 30 units of electricity were produced per ton of refuse burnt, and at Sherness, where there was an electrical plant worked by the destructor, they saved in six months £130, of which £189 represented a saving in coal. It was essential that the site of a destructor should be central to save the cost in carting.

OBITUARY.

THE death of Mr. JOHN BERNARD HARDMAN, the head of the well-known firm of John Hardman and Co., stained glass manufacturers and ecclesiastical metal workers, of Birmingham, occurred on Sunday at his residence, 130, Hagley-road, in that city. The deceased gentleman, who, in addition to his business connection, was the most distinguished Roman Catholic layman in Birmingham and a public-spirited citizen, was only sixty years of age, but his health had been failing for about two years, following on a bad attack of influenza. Mr. Hardman was born on May 5, 1843. His father, Mr. John Hardman, was of a Roman Catholic family which originally belonged to Lytham-in-the-Fylde, Lancashire. James Hardman, of this family, removed to Birmingham in the middle of the 18th century, his son, the first John Hardman of local fame, entering into the manufacture of buttons and medals. The late Mr. J. B. Hardman's father, forming an acquaintance with the elder Pugin, became enthusiastically interested in the Gothic Revival connected with the accessories of religious worship, and in 1838 he founded the ecclesiastical metal works, to which in 1845 he added the manufacture of stained glass. For many years he was in daily communication with Pugin, and was associated with him in the establishment of a studio of Christian art at Rainsgate, where were produced the cartoons for church windows which were carried out in Birmingham. John Bernard Hardman received his education at St. Mary's College, Oscott, at the Oratory, Edgbaston, and at the Catholic University of Dublin. In 1863 he returned to Birmingham, where in a short time, upon his father's death, he became a partner in the ecclesiastical art business then carried on in Newhall Hill, his partners being Mr. William Powell and Mr. J. H. Powell. In 1883 a separate manufactory for metal work was established in King Edward's-road, where the business was carried on under the title of Hardman, Powell, and Co. In 1876 Mr. Hardman became a member of the board of management of the General Hospital, and last year was appointed chairman of that body. He was also for four years a member of the committee of the General Dispensary. In 1874 Mr. Hardman was invited by the British Commissioners of the International Exhibition at Vienna to act as English juror for exhibits in art metal work and jewelry, and for these services he received the honour of being made a Chevalier of the Order of Franz Josef of Austria. Mr. Hardman was a member of the estates committee throughout his association with the council, and in 1883 and 1884 he was its chairman. Having been actively connected with the old School of Design, Mr. Hardman was, upon the school being taken over by the corporation, made a member of the new Museum and School of Art Committee, and he was also a member of the Art Gallery Purchase Committee. In February, 1901, Mr. Hardman's distinguished work received recognition in the bestowal upon him by the late Pope of the Order of St. Gregory the Great. Mr. Hardman was twice married, and leaves a widow, four sons, and eight daughters.

A preliminary meeting of those interested in the formation of a Quantity Surveyors' Association will be held on Wednesday week, the 18th inst., at the Duke's Saloon, Highborn Restaurant, at 4 p.m. We trust that it will be numerously attended by members of the profession, that a strong and representative committee may be selected, and the association put on a sound working basis. The hon. sec., pro tem., is Mr. F. B. Hollis, 17, Bedford-row, W.C., to whom all communications and suggestions should be sent.

The Court of Arbitration under the Metropolitan Water Act of last Session gave their decision on Monday on the question of the sinking fund and sterilisation clauses as affecting all the water companies. They came to the conclusion that the water properties were subject to the charge of such a fund, and that it must be valued as it stood. For these reasons they concluded that the contention put forward on behalf of the Water Board was right. The case for the Water Board was then continued, Sir A. R. Binnie, late engineer-in-chief to the London County Council, being under examination during Monday and Tuesday. Mr. G. F. Deacon, of Liverpool, also gave evidence in support of the Water Board's figures.

New sewerage works for Morpeth, carried out from plans by Messrs. Balfour and Son, of Newcastle, Mr. Kirtley, of Sunderland, being the contractor, were inaugurated on Friday.

PROFESSIONAL AND TRADE SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. W. Curtis lectured before the members of this society on Monday evening, at the rooms, Harrington-street, Liverpool, his subject being "Street Architecture: Formal or Irregular." The chair was occupied by Mr. J. Woolfall (president). The lecturer's remarks were illustrated by a large number of lantern slides reproducing typical examples of street architecture in various parts of the country. Specimens were also shown of types to be found in Italy, Germany, and France, whilst some views of more modern buildings in Edinburgh were thrown upon the screen. The effect of the straight line in architecture was noticed, and observations were made on the principle of constructing thoroughfares at right-angles. Regent-street, London, was selected as showing the beauty to be obtained by the formation of a curved street, and Wren's proposed plan for the rebuilding of London was also projected. To a certain extent, the lecturer said, the appearance of a building depended on the class of stone of which it was constructed.

CHIPS.

A sum of £5,000 is required to build the new permanent church of St. Luke, New Brompton, which, from a population of 13,000 in 1880, has grown into a working-class town of 45,000. There are only four parish churches, with a total accommodation of about 3,120. During this autumn in close proximity to the mission several streets are being opened up, and the plans for 120 new houses have just been passed. A freehold site for the erection of the church has been secured.

The jubilee of St. Luke's Church, Southampton, was celebrated last week. Various alterations, additions, and improvements have been carried out in the church, among these being the re ceiling of the nave and aisles, the introduction of a special system of ventilation, and the painting of the church throughout. In the chancel stenciling work has been done, and the choir seating rearranged. A carved oak altar retable has been provided. The north chapel has been treated in similar fashion to the chancel.

Johann Fadruss, the well-known sculptor, died at Buda-Pesth last week.

The rural district council of Uttroxteter at their last meeting adopted plans by Mr. Wilcox, C.E., for the drainage of the village of Denstone (estimated to cost £900), and instructed the same engineer to prepare plans for draining Rochester.

A meeting of the new town-hall committee of the Newcastle-on-Tyne Corporation was held last week, when instructions were given the property surveyor to prepare plans and estimates for rearranging the present town-hall. It is proposed to do away with the concert-room and at least one-third of the corn-market. The plans and estimates will be laid before the committee in due course, and subsequently the matter will come before the city council.

The Folkestone Town Council have received sanction from the Local Government Board for the borrowing of £14,950 for the purchase of land and the erection of a refuse destructor in the town.

The Local Government Board have approved of the scheme of sewerage and sewage disposal for Hagley and Blakedown, at an estimated cost of £7,500, prepared by Mr. Harry W. Taylor, A.M.I.C.E., of Newcastle-on-Tyne and Birmingham. The Bromsgrove Rural District Council at their last meeting gave instructions for tenders to be obtained at once.

Col. W. R. Slacke, R.E., has held a Local Government Board inquiry at Clown, into the application of the Rural District Council for permission to borrow £3,000 for carrying out a sewerage scheme for Hollin Hill.

At Selwyn College, Cambridge, the dedication has taken place of a window in the chapel in memory of the Hon. Arthur Temple Lyttelton, late Bishop of Southampton, who was the first Master of the college. Like the rest of the windows in the chapel, it is designed by Mr. C. E. Kempe, and forms part of a larger scheme which is being gradually carried out. It contains figures of St. Luke and St. Boniface, Anskar, and Methodius.

The Bishop of Oxford recently officiated at a dedicatory service in Little Marlow Church, Buckinghamshire, which has recently been restored at a cost approaching £1,000. In the course of the restoration, two entrances and steps in the north nave wall to the roof loft were discovered, having been built up from Reformation days, while a Norman piscina, in perfect preservation, was also built up in the stairway, and a priest's door has also been opened out in the north wall of the chancel.

THE KING'S SANATORIUM, MIDHURST.—ENTRANCE HALL, ELVEDEN.—NATIONAL SILVER MEDAL DRAWING: "THE RED KNIGHT COMES BACK TO HIS MOTHER, THE SEA, BEARING ELSINORE."—NEW CHURCH OF ST. THOMAS, EAST KIRKBY.—ADDITIONS TO ULLESTHORPE COURT.—NEW CLASSROOMS, HARBORNE.—SKETCHES FROM THE SALE ROOMS.

Our Illustrations.

THE KING'S SANATORIUM, MIDHURST.

THE King laid the foundation-stone of this building last Tuesday at Midhurst, and to-day we give the bird's-eye view and plans. The first-floor plan, of which we give the central portion only, is, so far as the wings are concerned, practically a repeat of the ground floor arrangements. Mr. H. Percy Adams, F.R.I.B.A., is the architect. The contract for the foundations is being carried out by Messrs. Langley, of Crawley, and Messrs. John Aird and Son did the plumbing operations for the water supply. Dr. Latham was the author of the international competition prize essay, on which the scheme for the sanatorium was based; but Mr. Adams has made his own plans on the lines advocated.

THE ENTRANCE HALL, ELVEDEN.

THIS drawing illustrates the octagonal entrance-hall of this mansion, from the designs of Mr. Clyde Young, the architect. The view was exhibited at the Royal Academy this year. The delicately-enriched plaster dome is carried by marble columns, having Corinthian caps and pedestals of the same material, the walls being panelled all over up to the frieze. Elveden Hall is situated in a game-preserving heathland district in Suffolk, some four miles from Thetford, formerly the residence of Admiral Keppel, the naval hero of a century since; it was for many years the seat of the late Maharajah Dhuleep Singh and his son Prince Frederick Singh. Mr. John Norton carried out much of the building erected by the late Maharajah, and Mr. Clyde Young has just built an exceedingly elaborate Indian hall for Lord Iveagh, the present owner of the property.

NATIONAL SILVER MEDAL DRAWING: "THE RED KNIGHT'S RETURN WITH ELSINORE."

THE drawing in question is an illustration to a story of my own. The context is as follows:—"A certain Red Knight returns home from wars in foreign lands, to find that, in order to escape from a forced marriage with his brother, who has given out false news of the Red Knight's death, his promised bride, Elsinore, has poisoned herself. Mad with grief and fury, he kills his brother, and, bearing dead Elsinore in his arms, leaps his horse over the cliffs at a place where he had been washed ashore thirty years before as a little child." It may be of interest to state that the drawing has been selected for exhibition at the St. Louis Exhibition by the Education Committee as an example of British students' work.

Antwerp.

ARTHUR WATTS.

NEW CHURCH OF ST. THOMAS, EAST KIRKBY, NOTTS.

THIS church was consecrated in May of this year. Sitting accommodation is provided for 360 adults, the congregation being entirely seated in the nave,

the aisles being merely passages about 4ft. wide. The principal entrance is at the west end, facing Lowmoor-road, the highway between Nottingham and Mansfield, and an internal porch is formed by a screen and swing-doors. A low, broad treatment has been adopted throughout in the design of the building and all its details and fittings. The walls are of brick, with local red-brick facings and Weldon stone dressings, the internal piers, arches, and corbels being of Ancaster stone, and the walls plastered and duresco-washed light olive green. The roofs are of pitch-pine, stained brown, and are covered with red tiles, the turret roofs being covered with lead. Messrs. Thompson and Sons, of Louth, Lincolnshire, were the contractors for the general work, and the seating (of pitch-pine stained brown), also the choir seats and pulpit, which are of oak. The carving, both wood and stone, was executed by Mr. Tuttle, of Lincoln. The dorsal hangings and the materials for the altar frontal were supplied by Messrs. Morris and Co., and the frontal was worked from the architect's designs (with some variations) by the ladies of the Southwell Diocesan Embroidery Guild. The boundary wall and gates were carried out by Messrs. G. Hopewell and Son, of New Basford, Nottingham. The total cost of the whole of the work was between £5,000 and £6,000. Mr. D. Davies was the clerk of works, and Mr. Louis Ambler, F.R.I.B.A., of London, the architect.

"THE COURT," ULLESTHORPE.

THE additions to the "Court," Ullesthorpe, Leicestershire, which are now carried out are a sitting-room, drawing-room, inner hall, dining-room, billiard-room, and three bedrooms and dressing-room, with a large landing as picture gallery. Further additions are in progress, consisting of a servants' hall, three bedrooms, and dressing-room, extra bathroom and other sanitary arrangements. The stabling and coachhouses are being rearranged, and new entrance gates erected. The work is being executed by Messrs. Robert Cooke and Sons, of Broughton Astley, from the drawings and under the superintendence of Mr. W. H. Harrison, F.R.I.B.A., of Victoria-street, Westminster. The sitting-hall is panelled throughout with oak panelling, and a new oak staircase has been constructed. Massive oak beams have been inserted in the sitting-hall and study.

HARBORNE PARISH CHURCH SCHOOLS.

THE addition of the two new classrooms to the above has recently been made from designs by Mr. Ralph Heaton, architect, of Birmingham. The materials were Hollington stone and bricks, and the cost about £650. Messrs. E. Giles and Son were the builders.

SALE ROOM SKETCHES.

THESE sketches were made at Messrs. France and Sons' rooms at a recent sale, which comprised a varied assortment of old furniture. The high-backed Charles I. Chair, which was sold for £9, has a cane back, with leather seat studded with brass-headed nails, the back legs and stretcher carved in the manner of that period. The Armchair was unsold. This also has a shaped and carved back, on carved legs and stretcher, upholstered in crimson velvet. The Gentleman's Wardrobe, of Chippendale pattern, was sold for £12. The upper part is fitted with sliding trays, inclosed by a pair of shaped panel doors, with carved pateries, surmounted by a finely-carved and fluted dental cornice. It also contains three large drawers. Lot 1st, the gem of the collection, was withdrawn, the reason not stated. It was described in the catalogue as a 7ft. 9in. circular Chippendale Table of unique design, with carved rim edge and finely-carved scroll-shaped gallery on fluted and richly-carved pillar, claw, and toes.

Professor H. S. Hele-Shaw, of Liverpool University, has been appointed, through the Colonial Office, to organise technical education in the Transvaal and the Orange River Colony. The appointment is not a permanent one, and Professor Hele-Shaw has been granted leave of absence by the University Council until September next.

The urban district council of Skipton have adopted the recommendation of Mr. Hill, E.C., of Manchester, to construct an additional reservoir on a site favourably reported upon by Prof. Boyd Dawkins. The proposed capacity of the new reservoir will be 140,000,000 gallons. The site of the new undertaking is at the foot of Embsay Moor, and is within about two and a half miles from Skipton.

COMPETITIONS.

ACTON.—The Town Hall and Municipal Buildings competition at Acton, W., has been decided. From over eighty names the following architects were selected to compete—viz., Messrs. H. T. Hare, Russell and Malloes, Maurice B. Adams, Lanchester, Stewart, and Rickards, Arthur Ardron, and Mr. W. G. Hunt. Mr. MacVicar Anderson is responsible for the result, and he has chosen the design submitted by Mr. Hunt. The estimates ranged from £50,000 to £80,000, the chosen plan being amongst the lowest. The accommodation to be provided was precisely stipulated, and the cost was to be calculated at one shilling per foot cube measured in all cases from below the footings. The designs are not on view yet, but arrangements are being made for their early exhibition in the Priory Schools, Acton.

MANSFIELD.—A special meeting of the Mansfield Town Council was held at the town-hall on Saturday, the business being the consideration of the competitive plans submitted for the erection of a new free public library, towards which Mr. Andrew Carnegie has given £3,000. The report of the assessor, Mr. Albert Nelson Bromley, of Nottingham, stated that he had investigated the six sets of drawings sent in for this competition, and he considered that the first premium should be awarded to the design marked No. 1. The author of this design showed a compact economical plan, with excellent supervision from the lending library. An entrance-hall, shut off from the street by a lobby with swing doors, gave in this design access to the lending library; also to the reading-room, the ladies' room, and the men's conveniences, all of which have direct supervision from the lending library. The reference-room was placed at the end of the reading-room; but this also had direct supervision from the lending library. A librarian's room, packing-room, and book-store were placed at the end of the building. The external design was well balanced and pleasing, but the figure subjects in the gable of the pediment were somewhat large. The second premium should, the assessor considered, be awarded to design No. 3. The plan had considerable resemblance to design No. 1, and the placing of the rooms almost identical, but it lacked compactness, and the elevations were not so much in keeping with the purpose as design No. 1. The chairman of the sub-committee recommended that the report be adopted and that design No. 1 be accepted, with slight modifications suggested by the assessor, and that the design No. 3 be awarded the second premium. The names of the competitors chosen are: No. 1, Mr. E. R. Sutton, Nottingham; No. 2, Mr. J. E. Goodacre, Mansfield. The report was adopted, and it was decided to place rooms in the town-hall at the disposal of the committee for the purpose of exhibiting the plans to the public.

CHIPS.

THE foundation-stone of the new workhouse nurses' home at Norwich was laid last week. The building, which lies just off the Bowthorpe-road, is to be constructed of red brick with Ruabon terracotta tracings to gables, while the sills and heads to windows will be of red Mansfield stone, and the roofs of Broseley tiles. The home will contain dining-room, sitting-room, superintendent nurse's room, kitchen, scullery, 14 bedrooms, baths, lavatories, and out-buildings, and will cost about £2,200, while the furnishing will cost another £800. Mr. B. B. Morgan, of Messrs. Morgan and Buckingham, Norwich, is the architect.

Mr. W. O. E. Meade-King, M.Inst.C.E., an inspector from the Local Government Board, held an inquiry at St. Mary's Hall, Welwyn, Herts, last week, to receive evidence of persons interested in the application for sanction to borrow £3,260 for works of sewerage and sewage disposal for the parish of Welwyn.

At Twyford, Hants, a new village-hall has just been completed. Mr. Kitchen, of Winchester, was the architect, and Mr. Young, of Twyford, the builder.

The Manchester and District Engineering Trades Employers' Association are seeking to bring about the standardisation of various structural parts of Lancashire boilers.

The total expenditure on the late Mr. J. F. Bentley's Westminster Cathedral up to the present time for work and material, including payments for the Chapter Hall and for the cloisters connecting the Cathedral with the hall and with the Archbishop's house, has been £196,000. On the general building fund account there is now a deficit of over £7,000.

Building Intelligence.

EALING, W.—Mr. Dudley Perceval laid the foundation of the Perceval Memorial Church (All Saints') at Ealing on Saturday. This church is being built as a memorial of Mr. Spencer Perceval, Prime Minister from 1809 to 1812, who was shot in the lobby of the House of Commons in the latter year. The site, which forms part of the grounds of the house, Elm-grove, which Mr. Perceval occupied at the time of his assassination, was given by Mr. Leopold Rothschild, and the cost of the building (between £12,000 and £13,000) is being defrayed out of moneys left for that purpose by Miss Frederica Elizabeth Perceval, the last surviving daughter of Mr. Perceval, who died at Ealing at a great age three years ago. The architect is Mr. W. A. Pite, F.R.I.B.A., who has designed an edifice based upon a phase of Early Perpendicular Gothic. The material externally will be of Stamford stone, with rock-faced walling in dropped courses, and internally the floor and chancel walls will be of marble, and the stalls, pulpit, and screen of fumed oak.

GRANGEMOUTH.—Grange U.F. Church, which was opened on Friday, is designed in a severe type of Early English Gothic, with very simple detail, and little or no ornament except such as naturally arises from the design. The longest front, in which is the main entrance, faces Grange Bank-road, along which it extends 126ft. A square tower, about 70ft. high, is placed at the north end of this front, and the principal entrance is at the base of this tower. Internally the church is divided into nave and side aisles by an arcade of three pointed arches on each side. At the pulpit end an arch of wide span divides the church from the organ-chamber, which is continued beyond the church. The ceiling is semi-octagonal in form, divided into bays by the main couples, and lined with dressed timber. The interior decoration is carried out in subdued tones of soft green and brown tints, relieved by bands of brighter colour. The seating and panelling are stained myrtle green, with the woodwork of pulpit and gallery front in grey oak. The church will seat over 630 persons, and the hall in connection is seated for 400 people. There are also a large session-room, vestry, &c. The cost has been £4,000. The architect is Mr. John B. Wilson, A.R.I.B.A., and I.A., Glasgow.

LIVERPOOL.—Princess Louise, Duchess of Argyll, laid on Wednesday the foundation-stone of the workmen's dwellings to be erected on the Hornby-street area. This embraces Hornby-street, Tatlock-street, and Raymond-street, and is being acquired by the Corporation as an unhealthy area under the powers of the Housing of the Working Classes Act, 1890. The total number of insanitary houses proposed to be acquired is 511, in addition to which there are 23 sanitary houses, making a total of 534. The population of the insanitary houses is 2,431. The new dwellings will comprise 23 blocks, or 445 dwellings, which, it is estimated, will accommodate 2,446 persons. There will be 48 four-roomed dwellings, 270 three-roomed dwellings, 90 two-roomed dwellings, and 36 one-roomed dwellings, a keeper's house, seven shops, and a recreation ground containing about 1,755 square yards. In Hornby-street the new dwellings are to be set back from the present line of street, increasing the width between the main line of the new dwellings from 36ft. to 70ft. The contractors for the first portion are Messrs. Joshua Henshaw and Sons, of Chatham-street, the amount of the contract being £23,382. Total area of the whole scheme is 26,025 square yards, and the estimated cost of carrying it out is £150,000.—The Marquis of Londonderry, K.G., President of the Board of Education, paid a visit to Edgehill Training College on Saturday, and declared open the new wing which has just been added to that institution at a cost of £11,800. Previous to the additions just completed, the college consisted of an educational wing with dormitories along the Clint-road front, and an administrative building connected with it, but facing Durning-road, with, on the Merivale-street side, a recreation room with dormitories above it. The present additions embrace a new wing extending from the end of the old recreation room. The old and new wings are nearly parallel, and are connected at their western ends by the administrative block. The ground floor of the new wing comprises a physics laboratory, 28ft. by 35ft., lecture-room, 66ft. by 27ft.,

divisible by a movable partition, gymnasium, 49ft. by 27ft., and steam laundry with an electric motor for driving the machinery, &c. On the first floor there are an art-room, 39ft. by 24ft., a dormitory for 18 students, and a governess's bedroom. There is another dormitory for 16 students over the gymnasium, with on the floor above a natural science room, 26ft. by 27ft., with glass roof and windows to the north. The elevations have been designed in keeping with the existing building, the façade to Merivale-street being of a Renaissance character. Messrs. T. Mellard Reade and Son, of Liverpool, have acted as architects for the college since its inception.

LONDON COUNTY COUNCIL.—At the meeting, on Tuesday, of this body, Mr. A. L. Fell, of Sheffield, was appointed chief officer of the Council's tramways at a salary of £1,500 a year. On the recommendation of the Highways Committee, the tender of Messrs. J. Musgrave and Sons (Limited), of Bolton, for the construction of four 5,000H.P. engines for the electricity generating station at Greenwich at a sum of £96,713 was accepted. There were seven tenders at a lower price, but several were incomplete. The Council decided, after a long discussion, by 61 to 44 votes, in opposition to a recommendation of the Highways Committee, to serve notice on the London Southern Tramways Company for the purchase of its system, extending from Vauxhall Bridge to West Norwood Station, 5½ miles in length. It was objected that the necessary street-widenings and conversion of the lines for electrical traction would involve an outlay of £450,000, and that the system did not at present pay. A recommendation by the Parks Committee that application be made for Parliamentary powers to prevent any building over the garden of Edwards-square, Kensington, and that it be referred to the committee to communicate with the owners of garden-squares in London, and to advise the Council as to what Parliamentary powers were desirable for the better preservation of such squares, was agreed to after discussion.

PLUMSTEAD, S.E.—The foundation-stone has been publicly laid of the new Church of the Ascension in Timbercroft-lane, on the borders of Plumstead, a district which is being rapidly built upon. The building, which will be put up in sections, is from the design of Mr. A. E. Habershon, A.R.I.B.A., of Queen Street-place, E.C., Green's End, Woolwich, and Erith. The site has 40ft. roads on three sides. The present portion includes three bays of the nave, and one side aisle, and a part of the chancel and vestry. When finished the church will have one more bay added to the nave arcade, a second side aisle, and two transepts, a narthex being under the main west window. The materials of which the church is constructed are:—Outside, stock bricks with red brick and terracotta bands, the arches over window and door openings being in alternate blocks of Doulton's red and buff terracotta. Inside, red brick arches to the nave resting on stone columns, and a red brick chancel arch, the walling being in yellow brick with red brick bands and ornamentation. The cost of the present portion (with seating) will be about £2,500. The builders are Messrs. J. Dorey and Co., of Brentford.

STREATHAM.—The London Baptist Association Church, Mitcham-lane, Streatham, S.W., occupies a prominent corner site. The portion erected at present includes the nave and aisles, as far back as the transepts, galleries, tower, and temporary apse; also two vestries which form a church parlour when the dividing folding partition is thrown back. The buildings are designed in a Late period of Gothic, faced in red brick and stone dressings. The accommodation provided is, on ground-floor 270 adults, in gallery 200 adults, total 470. In the complete scheme there will be 856 sittings, or a mixed congregation of about 1,000 persons. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's-inn, Strand, London, W.C.

There has lately been erected by Messrs. Jones and Willis, in Llangoedmore Church, South Wales, a stone pulpit, as a memorial to the late Ven. William North, M.A., rector.

The opening meeting of the Edinburgh Architectural Association was held in the Association Rooms, 117, George-street, on Wednesday evening. Mr. A. Hunter, F.R.I.B.A., president, occupied the chair, and delivered his annual address, the subject being "Haddon Hall." The lecture was illustrated by numerous lantern views.

LEGAL INTELLIGENCE.

ANCIENT LIGHTS.—At Dudley County Court on Monday, his Honour Judge Howland Roberts gave his deferred judgment in the case of Rollason v. Oakes, in which the defendant claimed £50 damages for alleged interference with ancient lights in dwelling-house property in Martin Hill-street. Messrs. Hooper and Fairbairn represented the plaintiff, and Mr. W. Lees appeared for the defendant.—His honour held that the light coming from two of the windows had been materially interfered with by the wall which defendant had erected. He did not consider that the damage sustained had been great, and awarded the plaintiff £5 compensation with costs, also ordering the defendant to take down the wall.

"THE SURVEYOR FOR THE TIME BEING."—**KENDAL V. BOROUGH COUNCIL OF LEWISHAM.**—In the Court of Appeal on Wednesday, before Lord Justice Vaughan Williams, Lord Justice Romer, and Lord Justice Stirling, an appeal by the plaintiff against the decision of Mr. Justice Kekewich, reported in the BUILDING NEWS for April 10 of the present year, p. 510 last volume, was decided. The action was brought by the owner of 17 houses in Montem-road, Forest Hill, within the Metropolitan Borough of Lewisham, for a declaration that an order of the Lewisham Borough Council apportioning the paying expenses of the road between the owners of the several houses abutting thereon was void, and for an injunction to restrain the council from collecting these expenses from the plaintiff's tenants. The plaintiff's main objection to the order was that the estimated expenses of paving the road in question were determined by Mr. Ernest Van Patten, who, as the plaintiff alleged, was not at the time when the estimate was prepared by him the "surveyor," but the assistant surveyor of the defendant council within the meaning of section 105 of the Metropolitan Management Act, 1855. Mr. Justice Kekewich held that, as section 105 spoke of the "surveyor for the time being," Mr. Van Patten, though he was not the permanent surveyor, was a surveyor appointed by and acting for the board in the matter, and came within the words of the section, and his determination of the amount was valid. The action was accordingly dismissed. The plaintiff appealed. Before the conclusion of the arguments terms for the settlement of the action were suggested by the Court, and were ultimately agreed to by the parties. The precise nature of the terms was not stated. The question of costs was then argued, after which the Court ordered that the defendants should pay £75 for costs.

CHIPS.

A new Primitive Methodist Church was opened at Branch-end, near Stocksfield-on-Tyne, on Tuesday. The church has been built at a cost of about £700, on the main road from Newcastle to Carlisle. The inside measurement of the building is about 47ft. by 21ft., and it seats 200 people. The interior is fitted up with pitch-pine, and the heating process is to be with hot water. The building has been designed and erected by Messrs. G. Watson and Son, of Stocksfield.

In our notice of the new hospital, Leeds, for women and children, just recently opened, we omitted to mention that, in addition to all the other up-to-date appliances, this hospital is fitted with an electric patients' lift, by Messrs. A. Smith and Stevens, of London.

The Bishop of Llandaff dedicated, on Wednesday, a font of St. Bees stone on an Irish marble pedestal, at St. Elvan's Church, Aberdare, in memory of Lady Lewis, wife of Sir W. T. Lewis, who died on October 2, 1902.

Mr. Alfred East, A.R.A., unveiled, on Wednesday, a memorial tablet on the west wall of the south aisle of Kettering parish church, in memory of Mr. J. T. Kettlehip, the animal painter, who was born at Kettering. The tablet is of repoussé bronze on a marble slab, and was executed by Mr. George J. Frampton, R.A., as a tribute to a brother artist.

Mr. William B. Ittner, Building Commissioner for the Board of Education, and a member of the St. Louis Architectural Club, was elected President of the Architectural League of America at the late St. Louis Convention. The League also voted to hold its 1904 convention at Pittsburgh, but no date was definitely fixed.

Mr. Justice Channell gave judgment, in the King's Bench Division, on Wednesday, in a case in which the trustees and holders of land in Hilldrop-road, N., sought to recover possession of it from the London School Board. The defendants had compulsorily acquired the property for the purpose of erecting a pupil teachers' centre; but the Court of Appeal had granted a perpetual injunction restraining them from spending funds for that purpose. The Judge held that the Board could not retain the land, and gave judgment for the plaintiffs for possession, and a declaration that they were entitled to damages. Execution was stayed with a view to an appeal.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contribution.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., L., LII., LIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 35fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation Advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* * * Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—T. C. F.—T. A. and Sons.—A. M. F.—S. T.—T. W. and Co., Ltd. (Guernsey).—C. S. A.—D. E.

"BUILDING NEWS" DESIGNING CLUB.

F. W. (By "Belvedere" a look-out balcony and turret is intended, but it is an optional feature. "H. M. C." means housemaid's closet.)—H. S. HOLIDAY. (Read the rules published in the BUILDING NEWS for Sept. 25 last.)—HORACE BIGGS. (Look up back numbers, and you will see how members contrive their drawings on one sheet. It is generally the case that the most indifferent contributors break the rule as to one sheet, or badly arrange their designs on one piece of paper.)

DRAWINGS RECEIVED.—"Norseman," "Stoney," "Zoccolo," "Stoop," "Musselburgh," "Obelisk," "B," "Black and White," "The Last Man In," "Ghost," "Quatre Bois" (unfinished), "Ydol," "Teaderfoot," "Markman," "Plumbbob," "Clerk," "Works," "Putrescens," "Fenland," "Black Hart," "Autocar," "Architect," "Leo," "Jingo," "Viking," "Moua," "Lavernock," "Orchid," "Woe Macgregor," "Jap," "The New Boy," "Cedric," "Inside Right," "Cast," "S. H. S." (device), "Broad Arrow," "Free Trade," "O. K.," "Spas," "Vectis," "Desperate," "Ilex," "The Kid," "Omega," "Fido," "The Magpie," "Arabiatang," "Prims," "Midnight Oil," "Liverbird" (Your name and address are perfectly illegible. Why write in so foolish a way?). "Criscross," "Iotic," "Digneori," "White Rose," "Double," "Sir Toby," "Regent," "Humber," "Pip," "Cave Canum," "D'Artagnan," "Takisara," "Old Mercer," and "Force."

The Abercarn Urban District Council have appointed Mr. John Williams, Risca, surveyor in the place of Mr. Stephens, resigned.

Correspondence.

DWELLING HOUSES: SUGGESTED PLAN BY DR. JOHN W. HAYWARD.

To the Editor of the BUILDING NEWS.

Sir,—Deliberate opinions by medical men on the planning of houses are so rare that architects cannot afford to let slip the opportunity of probing them to the bottom.

Perhaps Dr. Hayward will be so kind as to offer some further elucidations of the reasons which lie behind the many points of divergence the plan published in your issue of Sept. 25 shows from the principles which would guide any good architect in planning such a house. In the hope that Dr. Hayward will do this, I will, with your permission, touch some of these points.

Regarding the living-room, one may acquiesce in Dr. Hayward's conclusions if one assumes (since there is no scale) that the dimensions of the room are at least 25ft. by 20ft. The discomfort of having the fire and the door on the same side of a smaller room would be very great. Excepting the larder and beer cellar, and in some degree the kitchen, Dr. Hayward's remarks on the necessity for sunshine in this room should apply to the whole house; but, curiously enough, the remainder of the plan is markedly deficient in that respect.

The entrance-hall and principal corridor seem inadequate in size and wanting in dignity, and the absence of direct daylight, both here and in the back passage, would render the house dull, and in parts dark. The approach to the principal room of the house under the upper flight of the stair would be ungainly and mean; but in practice, the working out of headroom would probably result in considerable changes in the plan of the south end of the house.

The drawing-room might, as argued, be used mainly in the evening; but afternoon functions cannot be ignored, and the hygienic influence of sunlight is surely lasting and important enough to merit for this room a better aspect than north-west. The proper ventilation of the dining-room, which is in proportion a long narrow apartment, will be prevented by the greenhouse which extends across the whole width of the north-west end—its only outside wall, and this circumstance, considering the form and aspect of the room, will leave something to be desired in its lighting.

The central position of the kitchen would, I fear, disseminate the cooking smells through the house to the almost greatest possible extent, notwithstanding the closed compartment between the hall and the back passage, and this compartment, with its service hatch direct into the kitchen, and its want of light and ventilation would, I suggest, be an unpleasant, unhygienic, and unhygienic feature.

An architect would not dare, in a house of this class, to place the kitchen in a position where the morning sun would make it unbearably hot, nor to place the kitchen and butler's pantry windows where they must overlook the approach to the main entrance, nor would he be allowed to place a kitchen entrance within about 30ft. of the principal entrance.

The unusual position of the scullery, the darkness of the glass and china store, the means of access to the mistress store, are all matters which require explanation. The situation of the beer cellar in the middle of the house would no doubt secure a desirable uniformity of temperature; but, besides allowing the smell to get through the house, that advantage is discounted by the long journey the beer must make on delivery through the back passage and china store, or by the alternative route by the flower garden and the mistress store.

Many other points might be touched on, such as the ventilation of the ground floor lavatory into a greenhouse, and the matter of the provision of a servants' w.c. on the ground floor; but, of course, the plan is roughly sketched, and some of these remarks may in consequence be doing its intention an injustice. The general conception of the plan is, however, so far removed from what the utterances of medical men would lead one to expect in matters of light and ventilation, that perhaps one may be pardoned for asking a fuller explanation of its peculiarities.—I am, &c.,

Light.

At St. Luke's Church, Kingston-upon-Thames, on Monday, the vicar dedicated a stained-glass window which has been placed in the south aisle.

Intercommunication.

QUESTIONS.

[12019.]—**Scarcement**.—Will some reader enlighten me on the following point—viz. I possess a feu-charter for a piece of ground upon which a house is built. A plan accompanies the charter, with figured dimensions thereon. The sizes on plan show my ground to be contained in the space occupied by the house; but if the scarcements of 9in. be taken into account, I am entitled to the whole ground built on. The superior maintains that I am only entitled to what is above the ground level.—MARINE, Portree.

[12020.]—**Archbishop Benson's Monument, Canterbury Cathedral**.—Can any reader inform me who was the architect and who the sculptor of the memorial altar tomb and effigy of the late Dr. E. W. Benson, Archbishop 1882-93, which occupies the north wall of the north-western tower (western bay of north aisle of nave) at Canterbury Cathedral?—CHAUCERIAN PILGRIM.

[12021.]—**Temporary Building**.—In erecting a wooden building, say about 25ft. by 14ft. by 12ft. high to the eaves, and 20ft. to the ridge, if the supports are let into the ground, can the building when the tenancy expires be removed? Or does it become the property of the landlord by reason of the foundations being underground? If this is so, can you suggest a strong, but cheap, foundation resting on the ground, and one that can be removed at the end of the tenancy? Would 3in. by 2in. studs placed 1ft. apart and braced at intervals, weather-boarding tarred on the outside and mthboarded inside be sufficiently strong and waterproof for the sides? Or can a cheaper method be employed for this building, which has to be dry? Would weather-boarding be a suitable covering for the roof? The building would be erected in the country in a garden.—STUDIO.

REPLIES.

[12017.]—**Small Building**.—The answer to your seven queries is very simple, and it is, "Employ a Surveyor." It will then be his business to advise you and give you information on your buildings, and see that what you require is properly carried out.—CANTAB.

CHIPS.

The partnership hitherto subsisting between R. B. Broster and W. Broster, architects, of Keighley, Yorks, under the style of Barber, Hopkinson, and Co., has been dissolved.

On Saturday, in Dunblane Cathedral, there was unveiled a memorial-stone, commemorating the restoration of Dunblane Cathedral, begun in September 1889, finished in October 1893. The inscription is cut in black lettering on an oblong panel of white marble. Surrounding it is a shell ornament, with an acanthus leaf at each of the four corners. Outside this is a slip of black marble, while the outer frame is of dove marble, with an old Scottish moulding. The design is by Sir R. Rowand Anderson, Edinburgh, and its execution was by Mr. Birnie Rhind, A.R.S.A.

The Tylers and Bricklayers' Company give notice that a vacant almshouse and pension will be filled up at an election to be held on Tuesday, Nov. 24. Particulars may be obtained from Mr. Arthur Bird, the clerk, 6, Bedford-row, W.C.

The electrical station at Plumstead, built by the borough council of Woolwich, was formally opened on Thursday in last week. The total cost has been £90,000, of which the plant, including four miles of cables, absorbed £46,000, and the buildings for station and dust destructor £44,000. The brick-making plant, which has also been laid down, cost another £5,000. The plans and specifications for the buildings were prepared by Mr. Frank Sumner, the borough engineer of Woolwich, and those for the plant by Mr. John B. Mitchell, the borough electrical engineer.

The Bishop of Colchester preached at the re-opening on Wednesday of Alphamstone Church, Essex, after the restoration of the chancel. The work has entailed the rebuilding of a considerable portion of the fabric and the entire refitting of the chancel, which has been superintended by the architect, Mr. Arthur Blomfield Jackson. The original sedilia, which are excellent examples of early 14th-century work, have been discovered and replaced. These were broken up and the fragments built into a brick wall about 200 years ago, since when their existence was unknown till now. The autograph graffito of Nicholas le Gryce, 1578, the rector who then restored the chancel roof, has been found under a coating of plaster. Steps are in contemplation to repair the nave, which is full of good examples of 14th-century design.

The Benedictine Abbey of St. Mary Buckfast, South Devon, narrowly escaped destruction by fire on Wednesday morning. The stable and outbuildings contiguous to the church were burned down, and had it not been for the prompt assistance rendered by a fire brigade, the whole of the buildings would have been destroyed. The abbey was founded before the Conquest, was suppressed in 1533 by Henry VIII., but came into possession of the Benedictines again some 23 years since. Under the guidance of the lord abbot, the monks are rebuilding a portion of the ancient monastery.

Our Office Table.

THE rearrangement and construction of the roadways in the Mall in connection with the Queen Victoria Memorial is now in progress, under the direction of Mr. Aston Webb, R.A., P.R.I.B.A. A beginning has just been made with the work of forming the new central road and laying it with wood pavement. This road, which will centre on the statue of the Queen to be placed in the middle of the memorial opposite Buckingham Palace, will be 65ft. wide, and will extend as a thoroughfare open to the public as far as Marlborough Gate for the present, and ultimately to Charing Cross. On each side of this road there will be a double avenue of plane-trees, with a pathway for foot-passengers between each row of trees. The present wood-paved road that runs along the north side of the Mall will be converted into a gravel road for horses, 45ft. wide. On the south side the railings along St. James's Park will be set back a few feet to the grass, and in the space thus obtained a third pathway will be provided. The whole will be lighted with arc lamps placed on the avenues. This scheme involves the demolition of some of the trees at present growing in the Mall, as they occupy the line of the new central road, but in place of them new plane trees are to be planted at once to form the fresh avenues. By the beginning of February all the new trees will be planted, and the roadways and footpaths completed up to Marlborough Gate.

AN Exhibition of Art Applied to Manufactures will be held in the Shire Hall, Chelmsford, on Tuesday, Wednesday, Thursday, Friday, and Saturday, December 1, 2, 3, 4, and 5. The exhibits will embrace art manufacturing processes in operation, consisting of pillow point, Honiton, and other lace, ribbon work, embroidery, cloth weaving, leather embossing. Demonstration of natural colour photography, artistic lead-glazing, wood-carving and sculpture, mosaic manufacture, clay modelling, manufacture of pottery and potter's wheel, &c. Exhibits of art manufactures: Lace, art needlework, embroidery, damasks, silk brocades, and other art fabrics, artistic furniture fittings and hangings, art joinery, mantels, and enriched mouldings; valuable books and bindings, art publications, art pianos, ornamental glass of every description. There will also be on view a model of the Westminster Cathedral, exhibited in public for the first time at this exhibition, made under the direction of the late Cardinal Vaughan; art tiles and pottery, ornamental moulded bricks, electric-light fitting, art glass and metalwork, Doulton ware, art china, Japanese decoration, &c. Arrangements are being made for students of Chelmsford art classes to be seen at work, illustrating the various interesting processes of leather embossing, clay-modelling, decorative stencil work, silk and fabric decoration, gesso work, brush decoration, block designing, cutting and hand-colour printing, inlay and intarsia, weaving, art needlework, tile and pottery designing and making, &c.

ON the occasion of the Royal visit to the workmen's dwellings, erected by the London County Council on the Millbank estate, her Majesty the Queen suggested that the provision of more cupboard space would be a boon to the tenants. The Housing of the Working Classes Committee reported on Tuesday to the London County Council that, recognising the usefulness of the suggestion, they had decided to begin by having cupboards constructed in the tenements in Adelaide, Sydney, and Melbourne buildings, which had previously been erected on the Ann-street estate, Poplar. This work had now been completed, and they were taking steps to insure the provision of good cupboard space in all the Council's dwellings. In view of the great interest shown by their Majesties the King and Queen in the question of the housing of the working classes, they recommend that their Majesties should be informed of the action taken by the Council in this matter.

THE Winchcombe Rural District Council, on Saturday, had a discussion about the semi-parish church at Southam-de-la-Bere, near Cheltenham, the mansion adjoining having been the residence of the first Earl of Ellenborough. The church is situated in a farmyard, and the only way to it is through the farmyard. Its surroundings, therefore, are not of an ecclesiastical character, and the outside of the building is plain; indeed, it is

said that it was originally nothing but an agricultural barn. Entering the church, however, a stranger is astonished, as the decorations are very profuse, and there are many pictures, statuettes, and ornaments displayed upon its walls and upon brackets set up in every corner and crevice. The solicitors to the estate have made application for the repair of the short bit of road through the farmyard to the church; but the surveyor said the road is not to be found on the parish award or map, neither was the church ever marked there. Mr. Griffiths, the local councillor, said the rectors of Bishop's Cleeve had always officiated there every Sunday, and he thought the road should be repaired for the benefit of the public. Without evidence of liability, however, the surveyor, was instructed not to do anything.

The Lord Bishop of Southwell, Dr. Ridding, unveiled and dedicated, on Monday, a stained-glass memorial window just placed at the east end of the parish church of Hartshorn, to perpetuate the memory of the late Rev. H. W. Buckley, a past rector of the parish. The church, which dates back to the 13th century, has recently been restored at a cost of £2,600.

The consideration of the plans for new baths on Liverpool Pierhead, prepared by Mr. A. Saxon Snell, of London, and provisionally selected in competition, has been adjourned till the December meeting of the city council. The work is estimated to cost £70,000.

The Isolation Hospital for the urban district council of Chiswick is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues and Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

In reference to the correspondence which has appeared in the *Times* and other papers regarding Frosterley marble, we are informed that Messrs. Emley and Sons, Ltd., Newcastle-on-Tyne, have at all times this marble in stock, and are at present supplying it to the new Roman Catholic church at Norwich. They will be pleased to forward a sample on application.

Mr. E. A. Sandford Fawcett, A.M.Inst.C.E., Local Government Board inspector, held an inquiry last week into the application of the Hornsey Urban District Council for sanction to borrow £39,700 for the reconstruction of part of the Highgate Low level outfall sewer which collapsed during the heavy storms of August and September last. Mr. E. J. Lovegrove, the surveyor, explained the plans.

Mr. C. H. Mileham, of London, is the architect, and Mr. G. Kemp, of Aldershot, the builder, of the new church at Badshot Lea, Aldershot, opened last week.

A system of sewerage is about to be provided for the parish of Farnborough and small portions of Chelsheld and Orpington parishes by the Bromley Rural District Council, at a cost of between £7,000 and £8,000. The necessary order has been granted by the Local Government Board.

According to the current issue of *Indian Engineering*, Mr. James Ransome, F.R.I.B.A., consulting architect to the Government of India, will be relinquishing his appointment shortly to return to England.

The Emperor William has commissioned the sculptor, Professor Haverkamp, to produce a memorial to the late Herr Alfred Krupp, which is to be placed in front of the Imperial Yacht Club House at Kiel.

The altar-tomb for the grave of the late Dean of Winchester, Dr. Stephens, the cost of which is being defrayed by subscription, will be unveiled on Dec. 22, the anniversary of his death.

Mr. Thos. F. Shaw, architect and surveyor, of 60, Nichol-road, Harlesden, was found dead in his bed on Tuesday. He was an old resident, and had planned many of the new roadways and public buildings of the district, including the Harlesden Constitutional Club, of which he was a founder and a director.

The new corporation fire brigade station and depot, situated in New-street, Burton-on-Trent, was formally opened on Friday. The cost of construction was £6,000 for the station proper, and £4,250 for the depot. It has been built under the direction of the borough engineer and surveyor, Mr. G. T. Lynam.

The Bishop of Oxford on Thursday in last week laid the foundation-stone of a new chancel to the parish church at Loudwater, Bucks. The church has never been altered since it was erected in 1789, and retains its old-fashioned "three-decker" pulpit and reading-desk and uncomfortable high-backed pews. With the building of the chancel, the whole of the church and its furniture will be modernised, the total cost being £2,000.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Opening Address by the President, Albert Buck. 8 p.m.

THE ARCHITECTURAL ASSOCIATION.

NOVEMBER 6th: ORDINARY GENERAL MEETING at No. 9, Conduit-street, W., at 7.30 p.m. PAPER by Mr. C. A. NICHOLSON on "Modern Churches." LOUIS AMBLER } Hon. Secs.
H. TANNER, Jun. }

CHIPS.

At the municipal offices, Liverpool, on Saturday, Mr. James Cooper, chief sanitary inspector, was the recipient of a marble clock and a pair of bronze ornaments on his retirement on superannuation, after 31 years' service in the Liverpool Corporation. Dr. Hope, medical officer of health for the city, made the presentation.

A presentation portrait of Sir James Hoy, painted by Sir George Reid, has been added to the collection in the Manchester City Art Gallery. Other recent gifts to the gallery are a portrait of Sir Benjamin Heywood and a landscape by Vannini.

It was announced on Saturday that the Local Government Board have decided against the Malton Urban District Council respecting their dispute with Earl Fitzwilliam in regard to the repair of a portion of Railway-street.

A memorial window to the late Colonel David Milne Home of Wedderburn was unveiled in Coldingham parish church on Saturday. The central portion is heraldic in design, displaying the armorial bearings of the Homes of Wedderburn. Above the dedicatory words are inscribed "Remember" and "True to the End"; and the whole is surmounted by the words from the Book of Revelation, "Be thou faithful unto death, and I will give thee a crown of life," inclosing a crown and star. The window was designed by Mr. Robert Home, Frederick-street, Edinburgh.

The ceremony of screwing the commemorative pile of the new pier now being erected by the Weston-super-Mare Grand Pier Co. will be performed to-morrow (Saturday) by Mr. R. E. Dickenson, M.P.

Mr. E. J. Bennett, A.R.I.B.A., has been appointed by the town council of Gravesend as architect for the proposed free library in that town.

Messrs. Stones and Stones ask us to mention that Mr. Edwardes Sproat, of Glasgow, was associated with them as joint architect in preparing the competition design submitted for tramway offices, &c., at Liverpool.

On Saturday afternoon the Suffragan Bishop of Leicester (Dr. Clayton) dedicated a new peal of five bells at St. Peter's church, Aldwinckle. The bells replaced a set of three, one of which had long been cracked, and have been provided by Messrs. John Taylor and Co., of Loughborough.

On Wednesday week, Mr. R. J. Reece, M.D., an inspector of the Local Government Board, held an inquiry into the applications of the Burslem Town Council for sanction to borrow £13,000 for the provision of an infectious diseases hospital, and £275 for the provision of a disinfecting station and apparatus. The plans were submitted and explained by the architect, Mr. Reginald T. Longden, Moorland-road, Burslem, whose design was selected in competition. The buildings include two twelve-bed pavilions for scarlet fever and typhoid cases respectively, and a similar pavilion with a single-bed separation ward for diphtheria; there are also an isolation block of two wards, porter's lodge, administration block for matron, eight nurses, and eight servants, steam laundry, disinfecting-station, and mortuary.

Mr. W. O. S. Meade King, C.E., Local Government Board inspector, held an inquiry at Thurnscoe on Friday, when Mr. F. E. Nicholson, on behalf of the rural district council and parish council of Thurnscoe, applied for sanction to borrow £3,234, required for a water scheme, stating that the population had grown from 271 in 1891 to 2,366 in 1901. There was no opposition.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2549

FRIDAY, NOVEMBER 13, 1903.

AN IDEAL TRAFFIC SCHEME FOR LONDON.

A SCHEME for the development and unification of London traffic has been long under consideration; but now we have the promise of a definite plan placed before us by the London Traffic Commission, which resumed its sittings last Friday at the Westminster Palace Hotel, the first meeting since the return of the sub-committee's visit to the United States. The evidence given by the superintending architect of the London County Council, Mr. William Edward Riley, F.R.I.B.A., is of special interest, and we propose briefly to give the main points of scheme proposed by him, which will be based partly on the system of direct communication by irregular curves of the underground London railways and that adopted by the municipality of Paris. The latter system is described by Mr. Riley, "an ellipse formed of three irregular curves surrounding the city, but within the old Centure railway"; one of the inclosing sections is carried across the city north and south, in addition to a shorter one, and others running east and west—six distinct lines, all worked on the shuttle system, with looped ends, to facilitate the return of trains running in each section, and minimising any dislocation of traffic caused by breakdown in any section. The superintendent architect's ideal scheme for London, as given in his evidence, is "one giving circumferential lines at various distances apart, and crossing these diametrically by other lines running across the county, and joining the circumferential lines with the centre points." As pointed out, the existing and authorised electric systems (of which only the North-West London and City and Brixton tubes are not yet in course of construction) are made of a series of irregular lines which do not constitute a unified system. To bring these projected lines into unison with the present scheme they will require some alteration. Mr. Riley also suggests broad avenues converging towards the central area of the county, to increase facilities for locomotion, and these avenues would provide for underground as well as surface traffic, and it is proposed "that the underground systems of all the diametrical lines, both tube and shallow underground, might be looped at the outer ends, as in the Paris system," in order to facilitate future extensions. The want of quick communication between such centres as the Elephant and Castle and Waterloo and London Bridge Stations, both on the south side of the river and between centres on the north side, as those of Charing Cross and King's Cross, Piccadilly-circus, the Bank, &c., is a serious and growing complaint, as every one who dwells, say, on the south side knows to his cost. The tubes have relieved the situation to a small degree, but are inadequate, and we believe that the shallow subway or tramway would be the more desirable form of locomotion. Such a route from the Marble Arch to Cricklewood would no doubt be of much public service. Mr. Riley observes "that along all the main roads and railway lines which run towards the central area is conveyed at least twice a day, in and out, a large mass of the working and business population from all parts of the county, and also from districts situated well beyond the county boundary." The central area is roughly indicated by a line drawn as follows, viz.:—From King's Cross via Euston-road to Baker-street Station, Victoria Station, Vauxhall, Elephant and Castle,

Tower Bridge, Shoreditch Church, City-road, Angel, Islington, and back to King's Cross. Within this area the traffic for the most part of the day is congested at several points, and these congested points are enumerated, and include such centres as King's Cross and St. Pancras, Oxford-circus, Piccadilly-circus, Charing Cross, Waterloo Station, London Bridge, Liverpool-street, Bank, the Angel, &c.

Other congested centres are outside the central area, such as Kennington Gate, the "Plough," Clapham, Camberwell Green, New Cross Gate, &c. The railways pour vast masses of persons from the outer zones to the central area, and these crowd the streets near the terminal stations, and have to find their way by crowded thoroughfares to the various centres in the central area. By connecting the terminal stations this crowding and confusion will be greatly reduced, and passengers will be able to reach any centre within the area. The importance of connecting the railway termini cannot be overrated, and the existing services, as pointed out, could be extended so as to form one system of intercommunication. A suggested method of linking the railway termini is to extend the City and South London Railway from its "Angel" terminus, via King's Cross, St. Pancras, and Euston, to form an interchange station with Baker-street and Waterloo Railway near the top of Portland-place and having interchange stations with the Great Northern and Strand Railway, and the Charing Cross, Euston, and Hampstead railway. By this route, and the connected Baker-street and Waterloo Railway, many of the trunk line stations would be brought into communication. These are enumerated. One advantage would be to extend the Great Northern and Strand tube from the Strand, its proposed terminus, under the river to Waterloo Station, thus securing a north and south line. Another line proposed is from Piccadilly Circus to Charing Cross, the Law Courts, Ludgate Circus, and the City, which now is only traversed by crawling omnibuses, which during the day are much obstructed by street traffic. The interchange stations would be few, and is thought would not cause any serious delay.

Referring to road traffic, the evidence furnished is equally important. Where practicable, tramways should, it is suggested, approach nearer to the centres north of the river, and the dangerous termini at Westminster and Blackfriars bridges would be avoided by extending the tramways over the bridges. As a general principle, Mr. Riley thinks that passengers should be conveyed from outlying districts by lines radiating from the central area to the county boundary. Among the additional routes are specified (1) from Highbury via Hornsey, to Tottenham, (2) Clapham Common to Tooting, (3) Poplar to Eltham via Greenwich, returning via Lee, Lewisham, New Cross, Deptford, and Bermondsey, and crossing the river to the Monument; (4) from the junction of Sloane-street and Knightsbridge, down Sloane-street, along King's-road, and crossing the river to Putney; (5) an extension to Willesden Junction of the Baker-street and Waterloo Railway from the present authorised termination at Paddington, (6) Walthamstow, through Leyton, entering the City by Bethnal Green; (7) Queen-street, under the river, through Peckham, and ending at the Crystal Palace; (8) from Marble Arch to Victoria and Vauxhall in the direction of Camberwell and Peckham. It is pointed out that omnibus traffic has the advantage over railway or tramway in being able to cross the central area in any direction on the surface, though often impeding other street traffic. The locomotion extensions outside the central area suggested would convey working and business people—a duty which the present railways are quite unable to do. The City and South London line is instanced

as a good example of a direct route across the central area into the outlying parts, and the evidence points to the importance of extending the line beyond the Plough, Clapham, towards the large estates in progress, including the Council's Totterdown housing scheme. The proposed City and Brixton line might also be extended towards the county boundary, and become a most desirable link.

Alluding to the construction of new streets and broad avenues, this witness thought that the lines of such thoroughfares might be made to pass through inexpensive property, to avoid the purchase of costly interests such as would be necessary in widening existing streets. By purchasing sufficient property on both frontages, and providing for tramway lines and shallow tubes, a return from the outlay would be obtained. Several desirable routes for such avenues are given. Some of these are in the direction of radiating centres suggested. One of them is a north and south line, already mentioned, beginning at Southampton-row, near the north end of Kingsway, and passing parallel to Caledonian-road, to the east of Finsbury Park, and southward to Sydenham. Other routes include a north-east and south-east route beyond the county boundary to Leytonstone, beginning at the Tower of London, a south-west route from the western end of Victoria Embankment to Richmond beyond the county boundary crossing the Thames; a west route from Uxbridge-road westward passing Wormwood Scrubs to East Acton; a north-west route from north end of Portland-place to boundary of Paddington Recreation Ground. These avenues are only suggested, and their usefulness might be increased by their extension across the central area. The mileages of these routes within the county in both directions are stated; but we do not enter into details here. The areas in most need of additional locomotive service are said to be in the south-east district—e.g., areas in the district of Camberwell, Dulwich, Brixton, and Tooting, which will open up building land. The witness points out the difficulty of securing land within the central area at a price which will admit of the erection of working-class dwellings with financial success without charge on the rates. The less dense zones have therefore to be utilised, those beyond the county boundary; but the rapid locomotion proposed would bring these outlying districts within reach of the central areas; and it is pointed out the conditions would be so equalised that the keen competition with commercial projects when acquiring land in central districts would be less acute, and the Council would not be compelled to confine their operations to the narrow limits which are now necessary. Comparing the cost of housing at the Council's estate at Tooting and at the Bourne Estate (Reid's Brewery), it is stated that a family of six can be housed at Tooting for about five-eighths the cost of the land only at the Bourne Estate. Thus the cost of a three-room cottage at Totterdown, including land, and road and sewers, is given at £263 10s., and the actual cost of a three-room tenement at the Bourne Estate £761 12s. These are the main points in the evidence which appears to be so conclusive.

Everyone who looks at a map of Greater London and its environs must have noticed the numerous irregular lines of railway and main roads which converge from places like Rickmansworth in the north-west, Barnet or Enfield in the north, Brentwood in the north-east to the central area; on the west from Egham or Staines, on the east Dartford, and on the south from Croydon, or Sutton, or Weybridge. These converging lines and roads thicken, and produce many ramifications when they approach a radius of about five or six miles from St. Paul's, and it will be seen that they approach to, though not actually connected with the irregular oval of

the District and Metropolitan Railways. But what a confused and disjointed system! From the south side one has to travel by a circuitous road by bus or cab to reach the terminal stations on the north side or those on the Euston-road, and conversely passengers alighting at Euston or King's Cross have to proceed by long detours or by slow omnibus routes to Charing Cross or Waterloo or Ludgate. What with the "Inner Circle" and "Outer Circle" railways, and the other loops of lines made by the North Western, the Midland, and Great Eastern and Great Northern and similar systems on the South, there is a network of railways which is perfectly bewildering to the public. An ideal scheme such as that proposed would be to make the great radial lines more regular and equidistant, and connect them by circle lines at their termini, and at other convenient distances, so that every part of the Metropolis could be within easy reach. Mr. Riley's scheme practically does this for London; it distributes equally, so to speak, the central termini, and those on the outskirts of the Metropolis as far as possible, and at once relieves the traffic of the few large termini which now do duty. We may look at the problem in another way. There is the large central congested area of population of the City and Westminster, the area wherein all the work and industrial centres of the world are concentrated, radiating from which are main streets and lines of railway. These form the great arteries, through which at intervals of the day every twelve hours a vast ebb and flow of human traffic, vehicular and pedestrian, takes place. In the early morning hours hundreds of thousands of people pour themselves into the congested centre, and during the evening the same crowds make their way outward. Every thoughtful observer of the rapid growth of the Metropolis must see that with the increase of the population the central area must become more and more congested, and that the pressure of the traffic from an ever-extending outer boundary must soon cause the channels of communication or arteries to become too narrow to discharge their living stream. A road or street constructed a few years ago is quite inadequate now to discharge the large amount of traffic, and this applies, of course, in a greater degree to the streets which enter the City from the various outlying districts. They are becoming too narrow for their original purpose. The plan suggested by Mr. Riley for linking the railway termini by which a passenger, say, from Waterloo to Euston would be able to make his journey without changing or by only one change; the suggestion of forming broad avenues passing through populated areas as, for instance, the north and south route from, say, Southampton-row northward to Finsbury Park and southward to Sydenham within the county, and other routes proposed are ones that deserves attention before the acquisition of property becomes a serious item of cost. These avenues, no doubt, should pass through the central area. The scheme proposed by the superintending architect is a noble one worthy of the municipality of a great and wealthy city.

THE PRACTICAL IN BUILDING.

AN inclination to shirk the practical in building as well as other pursuits is one of the tendencies of the age, and this has been mainly owing to the academical training of professional men, and to other causes such as competition, hurry in business, and the desire to make a reputation—all of which things have been quite opposed to a thoughtful study of the real requirements and functions of building. Building schemes are now taken up from purely commercial and business motives; it is a question of being first in the

field, of competing with large firms, or of obtaining public support, and of showing a good investment. There is the hurry and rush of preparing designs, in which the architect only takes cognisance of the general requirements, and has no time to enter into practical considerations such as accommodation, construction, cost, and the like, or to weigh such matters as the best and most workable plan, the best arrangements for plant, for heating or ventilation, or the most practical system of fire-resisting construction, &c. The architect has no time to study these details. The plans and scheme must be prepared quickly and advertised. Even the contract must be hurried. The architect likes to see even his name associated with the scheme. The company or promoters are eager to obtain all the support they can. Such haste is inimical to careful thought and practical considerations. To consider first the planning of buildings. How few architects in the present day look at the subject as a really scientific study, in which definite facts and data are closely related, or as a part of the design requiring personal knowledge of the habits and wants of the kind of tenants, or of the class of occupants who use the building, in which every person has an interest, of those who do business in the building, or who live in it? The ordinary professional man takes a few plans of the sort of building he wants, and proceeds to sketch out an arrangement till he thinks it will answer. Or the problem is solved in his mind if he hits upon a plan which will give the rooms and the dimensions required by the instructions. But how these rooms are to be located or grouped, with the object of saving the time of those who use them; whether an official will find it more convenient to have his office within easy communication with his clerks, or if there should be a door between one room and another; which offices are most frequented by the public in a municipal building; or how a number of students will stand or sit round a laboratory bench; the most convenient mode of arranging the kitchen offices in connection with a particular building; how a few feet of corridor can be saved, to diminish the servants' labour, are little matters which never enter into the head of the designer of a certain class. And yet these are just the points and questions upon which the working aptitude of the plan depends. They make all the difference between a practical and an impractical plan. Competition plans are often destitute of this special study, and we go through many designs for municipal offices, libraries, technical institutes, which show an utter indifference to the simplest duties of town clerks and surveyors, rate collectors, sanitary inspectors, or medical officers and students, or those who superintend libraries, or go to borrow books. Again, in public halls and places of assembly the movement of crowds entering or leaving ought to be made a study, so that all confusion and jostling may be minimised as much as possible. In dwelling-houses the problem should be to place every room in its right place for use and aspect, to reduce all passages, to avoid steps, and to facilitate by every possible and direct means the conveyance of goods and provisions, and so to economise service and the labour of servants. The kitchen should be convenient to the dining-room, the sanitary arrangements be confined to one part of the house, and the service and waste pipes placed so as to be accessible for repair. These are points constantly neglected in the desire to conform to some type of plan. Even in such details as the size and position of tables and sideboards and other furniture we find little attention paid to the seating of guests and the room necessary in serving them. These points of plan become more urgent in the design of labourers' dwellings and cottages, where every inch of space is of value. The

positions of larders, closets, seats, and bedsteads ought in every case to determine the size and shape of the rooms. The economics of plan, indeed, open a large question in the design of every class of building.

* Practical considerations enter no less into questions of materials and construction. The wrong material may involve, and often does entail, unnecessary expense in repair and painting, &c. We often see provided the wrong sort of wood for inside joinery, and panelling which shrinks and is full of "dead knots," and which requires continual painting; or we see the wrong sort of wood put into panels for staining and varnishing, which ought to have a good "figure." Thus, in selecting hardwood for joinery, the panels should be selected from the ornamental portion of the plank, whereas the framing may be straight-grained. The plank should be cut specially for this purpose. For varnished work, the pieces for framing and panelling ought to be selected for these particular positions, instead of which we find little attention given to the subject by the architect; different shades of wood, heartwood and sapwood, are placed together in the same panel, which renders the joint between the pieces visible, or half the panel is "figured," the other half plain. As a matter of fact, it makes all the difference the way the wood is cut; if cut radially the figure is exposed, whereas tangentially the grain is straight. How many mistakes are made in the selection of fir. "Deal" is described, whereas the term does not refer at all to kind of wood or quality, but to size only. The many varieties of fir and of oak are confusing; the architect is more successful if he can distinguish the principal kinds, and insists upon obtaining them; but he must do this before they are "primed," which is done before they are sent on the building. In such trades as stonework and brickwork, the architect is obliged to accept a great deal of very questionable material if he does not personally know the difference between, say, a limestone and a sandstone or a bath stone of one kind from that of another bed. Then if he is told that the stone has been laid upon its "quarry bed," he ought to be able to determine whether it is so or not. The omission or want of knowledge in either case may very seriously impair the durability of the stonework, and may render future repairs costly. The practical supervisor will exercise a great deal of his time in looking at the material, whether timber or stone, before it comes to the building; he will be better able to determine whether the timber or deals are of the specified quality before their defects are covered up by paint, and to see if the wood is free from sap, whether the joints are of the right kind, and the grooving and rebating is done; also to see if the beds of stone are worked level, and the block is of the right dimensions specified. These are matters which can only be properly examined at the workshop. When once the material is put in the building or fixed there is little chance of detection. Bricks, too, should be examined before they are put in the building, and any of inferior quality be ordered to be removed, as they can be tested only by examination before being built into a wall. The practical man will make it a special study to know the various kinds and qualities of bricks on the market. He will also see that they are soaked in dry weather before being used, and are properly bonded at angles, reveals, in piers, bay windows, flues, &c., matters which are very seldom examined by the architect, who looks only at the finished work and the external appearance. Small details will receive his attention, such as the bonding of a pier, the working of a gauged arch, the number of joints to a foot in height, the make and squareness and arris of the bricks. He will see that the openings of doors and windows are of such a size that the bricks

will not have to be cut. The practical mind in building generally exhibits itself in dimensions which can be worked to with the least cutting or labour, in arrangements of material that can be made with the marketable sizes of such things as timber and brick; whereas the impractical architect puts the workman to unnecessary labour in specifying sizes which cannot be worked to without waste of material. Working drawings are often made which show thoughtlessness or disregard of these things. We see stone or terracotta blocks to dimensions which cannot be economically made to agree with the courses of brick, timbers cut to scantlings that entail great waste, whereas a knowledge of the conversion of timber by sawing would dictate a size for, say, joists that could be made out of a plank or a batten. To use the multiple of a brick for openings or some even dimension instead of cutting is appreciated by the practical bricklayer and joiner, and all engaged in building, as it avoids unnecessary labour. Hence the value of standard sizes for bricks, timber scantlings, iron and steel sections, and other materials. Draughtsmen and young architects appear to ignore these considerations of even dimensions, and add to the labour and cost without the slightest compensating advantage. A fraction of an inch in the depth or thickness of a joist, or the size of a modillion in a cornice, if insisted on, would put the builder to much extra cost in material and labour; but he does not as a rule trouble about these irregularities, but uses his own discretion, and the architect is often none the worse off for the slight alteration. So in making detail drawings of woodwork: dimensions and thicknesses are often shown which cannot be got out of the ordinary deals and battens. To a practical man such detail drawings are regarded with a kind of sneer; if carried out as the architect intends the cost is seriously increased. They have therefore to be altered, and the builder takes upon himself the task. But the architect's design may be shorn of its solidity and beauty by such alteration, and in this way many designs are robbed of the effect the designer intended. The architect wonders how it is when the work is done, whether it is a stone or brick, or a wooden cornice or window, or other internal joinery, the effect is meagre or thin; but he does not realise the actual working conditions, and that the builder has only tried to produce the same effect by adopting the trade rules without incurring extra expense. He had, of course, no excuse for making the alteration without consulting the architect; but the wary builder is too artful, and proceeds to carry out the detail to the best of his ability. If he had consulted the architect and pointed out that the material used would be an extra, the latter might have insisted on its performance; on the other hand, he might have shown another and better way of using the material. Thus the practical architect ought to understand the modes of conversion of material, and the marketable sizes which obtain. The value of standardisation of rolled steel sections is a case in point. The practical designer of iron and steel structures knows how useless it would be to show any sections that could not be obtained unless special rolls were made.

In the choice or specification of materials, too, there is often a thoughtless disregard of the circumstances; the local material, whether brick or some stone obtainable in the neighbourhood, is not thought of, but a material used that has to be brought from a considerable distance, to which the cost of carriage has to be added. Also in the working and treatment of stone and other materials, we often find a great deal of undesirable labour thrown away without any effect. In the use of granite in some positions, as in plinths or basements, it would be absurd to dress the surface to any

smoothness; the pick is sufficient to dress off inequalities, and to give a massive appearance. In finer-grained stones the tooling used should be adapted to the situation and character of the work. Often we see a smoother texture given than is necessary: the practical architect is one who will pay regard to the requirements of each case, and will specify the kind of tooling to be used. To dress a hard, coarse stone down to a smooth face would be wasteful labour; the effect would be better done by a claw tool, the teeth being cut to suit the texture.

The old Mediaeval masons knew well what kind of dressing to give to stonework, and many of the harder lime and sandstones used, which have not decayed by the weather, show clearly traces of the coarse tooling or chisels used. In timber and woodwork the adaptation of labour to the class of work and its position in the building is equally important. Sometimes a sawn or roughly-chiselled face may be used with better effect than a planed surface. Uniformity of texture or smoothness is not certainly an artistic quality in many instances: it implies mechanical labour and machine-turned surfaces only adapted for machines, the very reverse of all that is expressive or individual. Thus a piece of hammered ironwork is more artistic and pleasing than a piece that has been cast or turned out of the rolling mills. There is strength and meaning in handicraft of every kind. The modern craze for machine labour and smoothness has hindered art of the more vigorous kind; it has destroyed all individuality and character. The practical mind at least knows how far such qualities as uniformity and smoothness of manufacture are desirable. He knows that it is unnecessary in building to use "picked stocks" for ordinary brickwork, or to specify rubbers "gauged, rubbed, and set in putty" in a part that is out of sight or reach; for a similar reason he can value texture in brickwork and stonework, the hand work of chisel, or pick, or gouge in woodwork, and the hammer in wrought iron. He knows, in a word, how far to carry that desire for perfection and minute detail without prejudice to the work as a whole. He has a sense of proportion which we fail to observe in those who look at architecture as a field for the exercise of all kinds of experiments, eccentricities, and extravagant detail.

Two practical considerations deserve notice in this connection. The tendency to elaboration of design is shown in many designs, competition and otherwise. Instead of trying to discover a simple solution of the problem, the architect is apt to introduce or substitute a formula of a more complex kind, derived from outside examples. The consequence is to obscure the real conditions, to adapt another design for a different purpose, and to complicate the plan and treatment. Simplicity is lost in the attempt. If it is a design for a town-hall or offices, the architect tries to engraft what appears suitable into his work. He does so at the cost of simplicity and convenience; the plan becomes confused and too elaborate. If it is a design for a suburban church, the author cannot divest his mind of a type of building suitable only for a town. A simple treatment is out of the question, and the design loses character. A great deal of this forced kind of design is prevalent. Then there is the question of cost, which generally exceeds the funds at the disposal of the committee. They are both points of a practical kind, which appeal to all building owners and committees who have obligations to perform, but which many in the profession are slow to profit by.

The annual report of the sewage committee of the Bradford Corporation states that at Frizinghall an experimental apparatus for the distillation of grease direct from the sludge cake is now on trial, and the sale of the grease has created a new source of revenue for the committee.

THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting for the present session of the Architectural Association was held on Friday evening at 9, Conduit-street, W., the President, Mr. H. T. Hare, in the chair. The following fresh donations to the New Premises Fund were announced by the President: Messrs. T. E. Collett, £25; R. Hesle Tiltman, £25; the Proprietors of the BUILDING NEWS, £10 10s.; Leonard J. Williams, £10 10s.; Keith D. Young, £10; H. A. Cresswell, £5 5s.; F. M. Elgood, £5 5s.; G. W. Lane, £5 5s.; A. C. Martin, £5 5s.; J. W. Penfold, £5 5s.; J. A. Keeve, £5 5s.; Hugh Stannus, £5 5s.; Cecil C. Brewer, £5; Henry Tanner, sen., I.S.O., £5; G. H. Hamp, £3 3s.; E. Wallfrey, £2 2s.; F. K. Betenson, £2 2s.; Walter Cave, £2 2s.; T. P. Clarkson, £2 2s.; R. L. Hesketh, £2 2s.; J. C. T. Murray, £2 2s.; H. Whiteman Rising, £2 2s.; C. H. Brodie, £1 1s.; and Henry Tanner, jun., £1 1s. The President added that, in addition to this list, a number of members had, in accordance with the Committee's suggestion, doubled their subscriptions for the current session. Mr. Francis G. F. Hooper, hon. treasurer, formally moved the adoption of the committee's report and balance sheet for the past session. This was seconded by Mr. Needham Wilson, and was agreed to. The following were elected as members:—Messrs. Herbert Dennis, C. W. Reeves, E. J. Kelly, S. Greig, H. A. Bower, A. J. L. Leman, E. E. Beaumont, A. C. Caudwell, F. W. Commin, D. G. Round, F. G. W. Dudley, H. G. Burgess, E. D. Brown, F. R. Foster, and H. Merley. The President announced the following reinstatements:—Mr. John P. Seddon, one of the original members elected in 1847, and hon. secretary in 1850-51; also Messrs. H. P. Burke Downing, W. B. Huxley, Arthur C. Lee, and Harold A. Woodington.

MODERN CHURCHES.

A very full paper on this subject, illustrated by a large number of plans, sections, working drawings, and perspectives by the leading architects of the present day and their immediate predecessors, was contributed by Mr. CHAS. A. NICHOLSON, who wrote regretting his inability to be present owing to the dangerous illness of his father (Sr Charles Nicholson, Bart., since deceased). In the author's absence, the paper was read by Mr. F. C. EDEN. Modern church building, Mr. Nicholson remarked, might be said to have been evolved during the century just ended. Owing to a variety of causes, church building was at a standstill in England between the death of Queen Anne and the end of the 18th century. The influence of the Hanoverian Court was not as to foster an enthusiastic churchmanship. The population was almost stationary, the old churches sufficed for all requirements; if they fell into disrepair, they were patched up; if they were considered draughty and cold, ceilings were made, and partitions, pews, and galleries were built; if they fell or were burnt down, they were either left in ruins or else rebuilt in the plainest possible fashion. In London, and some other large towns, a few new churches were built; generally these were proprietary chapels, financed by the ground landlords and supported by means of pew-rents. St. Peter's Church in Vere-street, and Berkeley Chapel, Mayfair, may be taken as typical of the ecclesiastical ideas of the middle of the 18th century—plain, substantial, brick buildings, with round-headed windows and ugly belfries; their interiors reminiscent of St. James', Piccadilly, or St. Martin's-in-the-Fields.

ELIZABETHAN AND JACOBAN CHURCHES.

The few churches that were built or enlarged between the Reformation and the Great Rebellion were generally of Debased Gothic character, such as is met with in many Oxford colleges. Even Inigo Jones, who introduced Italian models after his travels on the Continent, built the church of St. Katherine Cree and the chapel at Lincoln's Inn somewhat after the old Gothic manner. After the Restoration, the fashionable style became that of the school of Wren. Side by side with this, however, there lingered on the remains of the old Gothic tradition, which never entirely died out in the remoter country districts. The nave and tower of the church at Warwick, built in Queen Anne's reign by one Sir William Wilson, and the churches at Dartmouth and Falmouth, the spires at Ilgham Ferrars and at Stratford-on-Avon are familiar examples of Gothic work executed during the 17th and 18th centuries. The lecturer proceeded to describe the revived Greek

churches of the days of Chambers and the Brothers Adam, and the "Gothicisms" of Essex and Wyatt, and then dwelt at some length on the

LITERAL CLASSIC REVIVAL

of George the Fourth's reign. Soane, Decimus Burton, and Wilkins were leaders in this movement, while the Wyatts and Nash frequently worked in the same style, which was adopted in most of the numerous London churches that were built in the years immediately following the battle of Waterloo. In 1818 Parliament unanimously voted a million of money for church building in London and other growing cities. A favourite ecclesiastical architect of the day was a certain F. Bedford, who designed many churches in the south of London, of which St. John's, Waterloo-road, may be taken as a typical example; a large, plain, square room fitted up with pews and galleries, with a portico at one end, and a halfry on the ridge. Three churches were built at the expense of the ratepayers in St. Pancras by Henry Inwood. The new parish church was designed in 1819 after the model of the Erechtheum, the steeple being adapted from the Tower of the Winds. The most remarkable Classical church of this period was Cockerell's Hanover Chapel in Regent-street. The recent destruction of this charming building seems most deplorable, although the new church in Davies-street, which was to replace it, is one of our best and most interesting modern buildings. Marylebone Church, completed in the year 1818, from designs by Thomas Hardwick, at a cost of £60,000, has a pretty steeple bestriding the ridge of a rather fine portico. The combination of these two features is incongruous; but the effect of the building is good, owing to the weathering of the Portland stone of which it is built. Soane's churches at Walworth and Marylebone, St. Peter's, Eaton-square, by Hakewill, and a church in Bermondsey by Savage, are all of Revived Greek character, and better than the general run of the work done at the time. Churches more or less Gothic in character were built in London and elsewhere. Amongst the Commissioners' Churches, two—by Sir Charles Barry and James Savage, at Islington—were singled out for special praise by "E. I. C." in the *Gentleman's Magazine*. These are large brick buildings of Perpendicular character, pewed and galleried like the Classic churches of the period, built with embattled parapets and square towers or octagonal belfries. Similar churches were built at Edinburgh and in several provincial towns, such as Liverpool and Brighton, and places in the Potteries district. The best of this class of churches was that of St. Luke, at Chelsea, by James Savage, a building of considerable size, with a pinnacled west tower.

THE TRACTARIAN MOVEMENT,

the writings of Pugin, and the rebuilding of the Palace of Westminster, combined in the encouragement of the Gothic Revival in the second quarter of the 19th century. Gothic architecture ceased to be looked upon with suspicion, or regarded as a badge of Popery. The preaching places which had hitherto sufficed for them, ceased to satisfy the requirements of the majority of Churchmen. The modern type of church arrangement was thus gradually evolved during the reign of Queen Victoria, and, with very few exceptions, existing buildings were altered in such a way as to make them conform to the prevailing fashion. After the year 1837, numbers of new churches were built in country places, and many of the old village churches were restored. A prominent early Victorian architect was

EDWARD BLORE,

who restored Lambeth Palace and refitted the choir of Westminster and Peterborough. There exist several churches from his hand, some of them in a starved Early English style, others imitated from the Romanesque churches of the Rhine provinces. These buildings are, as a rule, built of white brick, with cement or Bath stone dressings, and they are characterised by a singular combination of pretentiousness and meanness. After a few attempts to reproduce Norman work, or basilican arrangements, the fashionable church architects of the middle of the last century settled down to a style imitated from English Decorated work, using Early English, which was supposed to bear being starved, for cheap jobs. Considerable improvements were at this period introduced in the liturgical arrangements of churches—galleries and pews were generally abolished, chancels were formed, and more space was provided about the altars.

CHEAP AND HASTILY BUILT CHURCHES.

Like most good people who are very much in earnest, the Gothic revivalists often went too far. They built too hastily and too cheaply; they restored too energetically. Some of their work is already ruinous after only half a century's wear and tear; yet it is hardly fair to blame the individual architects for this, since they were obliged to supply a growing demand at a very low cost, and, if one man declined a commission, a rival would always be found ready to step into his shoes. The cheapness of churches built in the fifties may be partly accounted for by the growth of the railways, and partly by the fact that church designs were then generally based upon rural and parochial models. The choice of this type minimised constructive difficulties, and made it possible to cover a considerable space in a very economical fashion. As a result, the churches of this age are seldom of a really imposing or of a dignified character. The lecturer devoted some attention to the better work carried out by Pugin, and continued: Meanwhile,

THE ECCLESIOLOGICAL SOCIETY

was steadily influencing the architects of the day. Beginning by insisting upon a literal reproduction of old forms as a necessary preparatory process, the ideal of these enthusiasts was to bring about the development of a new and living vernacular architecture based upon Gothic models. Scott, and Brandon (the architect of the Irviogite Church in St. Pancras) were to a certain degree in sympathy with the views of this society, but less so than Carpenter, Butterfield, and Street. Carpenter's opportunities were few, but his fine church in Munster-square is sufficient evidence of his ability, and an unexecuted design of his for a cathedral at Colombo is quite remarkable as an original attempt to adapt Gothic to a hot climate. Slater (who had been partner with Carpenter), Ferrey, Withers, Dawkes, Buckler, Brandon, Teulon, and Christian were all popular church architects in the fifties and sixties. But the work of Butterfield and Street was far ahead of that of their contemporaries, and its superiority quite justifies the patronage they received from the Ecclesiological Society. All Saints, Margaret-street, Butterfield's first great work, was designed so long ago as 1849, and is a marvellous production for its date. The fine outlines of this church, and the completeness and thoughtfulness of its details, stamp its designer as an artist of real genius. Whatever may be thought of some of the details of Butterfield's work, there can be nothing but admiration felt for his strict insistence upon principles, and for the thoroughness with which he worked. His architectural detail was invariably based upon purely English models. He made a frank use of modern materials and modern constructive expedients, and always insisted upon the inclusion of every detail of ornament and furniture as part and parcel of the architect's scheme, determined by him at the very outset of an undertaking. Butterfield's restoration work is less commendable than his original designs. Butterfield had few followers, but the work of George Edmund Street had a very strong influence upon his contemporaries. Like Butterfield, Street remained faithful to Gothic motives, though in the middle of his career he was very much influenced by the beauties of French and Italian models. His constructive ability was hardly equal to that of Butterfield, but, like him, he insisted upon sound building and upon adherence to a standard of liturgical arrangement in all his works.

MIDDLE NINETEENTH CENTURY WORK.

Sir Gilbert Scott, in his career of forty years' duration, did as much as any architect to influence the taste of the nation. Working at first in correct English Decorated style, his later buildings are often somewhat French in character, though he never went to the same length as Street or Barges in these matters. Posterity will perhaps judge him upon the merits of the numerous restorations which he carried out. This is hardly fair to his memory—he may have made mistakes sometimes; but we may well be thankful that he was at any rate more conservative and modest than most of the architects of his time. Barges did not carry out very much important church work besides Cork Cathedral and the excellent restorations at Waltham Abbey. His church of St. Faith, at Stoke Newington, is, however, interesting as being arranged upon distinctly modern lines. The churches build by James Brooks in North London

are designed in an early and severe manner, solidly built, and of fine proportion. Brooks's churches are roomy and well arranged for modern requirements, and their architect frequently introduced vaulting over the whole or a part of the buildings carried out by him. The late John L. Pearson's large town churches are a class by themselves. His churches are all vaulted throughout, and designed with great constructive skill, the area of the supports being reduced to the least possible limits. Their plans are often ingeniously arranged to fit an irregular site, their detail is severe and of strictly English origin; but they vary considerably in general design. Perhaps the individual features of these churches may be considered unduly small in scale, and their effect is rather toy-like in consequence of this, yet the various parts are always in agreeable proportion with one another, and are refined in themselves. A contemporary of these was the late Sir Arthur Blomfield, some of whose earlier churches deserve attention on account of their frank modernity, iron columns and galleries being freely introduced.

LATE NINETEENTH-CENTURY WORK.

Little important church work was done at the end of the nineteenth century, and most of it was entrusted either to the architects just mentioned or to living artists of unquestioned ability. The younger Gilbert Scott and John Sedding, though their opportunities were few, certainly founded a school of imitators, if not of followers. The former, with Messrs. Bodley and Garner, and others, evolved a refined modification of Late Gothic work which is seen at its best in large town churches. Sedding, with an intimate knowledge of old work, was, nevertheless, frankly modern in his ideals. Each of his buildings marks a fresh phase of his versatile powers. The earliest and most complete of his churches, that at Bournemouth, has a nave and a chancel with very slender arches opening into a north aisle, a stone rood screen and reredos, and a western tower, the detail being Late Decorated, and all the accessories of the church very complete. Cardiff, Hayle, Falmouth, and Highgate are great, simple, hall-like churches, with narrow aisles and no chancel arches, their detail based upon early models. At Truro Sedding followed the old Cornish type. At Clerkenwell the work is Renaissance, steel stanchions and girders being inclosed in concrete columns and entablatures. Holy Trinity, Chelsea, is a wide, hall-like church, with widely-spaced and massive piers, and it was intended to give eminent painters and sculptors a free hand in its internal decoration under the general guidance of the architect. The last church which Sedding designed was built after his death at Ealing by his successor, Mr. H. Wilson. Here the supports are unusually far apart, and the piers carry wide and low segmental arches. There is no clerestory, but galleries are formed over the flat ceilings of the aisles, with three triforium arches in each bay of the nave. The nave is lighted by a huge west window with traceried buttresses, suggested, perhaps, by those at Gloucester. Sedding, like Pugin, was a most versatile designer. His woodwork is unrivalled in fancy and refinement; his embroidery, glasswork, and metalwork are full of interest, and always designed in strict accordance with the nature of the material used. To some extent J. F. Bentley's work resembled that of Sedding, though it was founded more strictly upon precedent. In his last and most important church, he was compelled to follow archaic and foreign models, and he attained a result which bids fair to be honoured with the sincerest form of flattery.

DURING RECENT YEARS

many good, bad, and indifferent churches have been built; many styles have been imitated, and many mannerisms developed only to be forgotten. One is therefore led to the conclusion that architectural style is no longer a question of mouldings and traceries in these days of cosmopolitanism and railways. A building may be unmistakably modern, whatever may be the shape of its windows or its pillars, the disposition of its parts, or the materials of which it is constructed. Unintelligent plagiarism of eccentricities should be deprecated. Thus a fashion has lately arisen for bisecting traceried windows with clumsy mullions running up to the arch apex, a device calculated to cause the stonework to be fractured in the event of any settlement. Another latter-day freak is the boldly buttressed tower, abruptly cut off at the top without any cornice or other archi-

tectural finish, and sometimes capped with a temporary-looking shed-like roof, or with a stunted dome. As regards ornament, it goes without saying that it should not be used unless it is the best of its kind. This means that good diaper work is better than bad figure-work; white-wash is better than commonplace decoration, and plain windows to be preferred to tinted cathedral glazing, and, indeed, to most stained glass. Brick and stone are better than tawdry polished granite, and good woven work than ordinary church embroideries. Architecturally, the great invention of recent years is

THE CHEAP CHURCH.

The cheap church of fifty years ago was ornate, but shoddily built. Twenty years ago economy was effected by building substantial and fairly complex churches of the cheapest and ugliest materials, red and yellow brick, fitting them up with varnished deal furniture, and stunting their general proportions. Where funds are limited it seems better to adopt an economical plan from the outset, discarding chancel arches and complexities of roofing, and spending the available funds upon sound building and some degree of finish in the details. Sedding's churches at Falmouth and Ealing are capital examples of economical planning. Though solidly built, and of good scale and proportion and interesting detail, the cost of these churches worked out at about 6d. a foot, or £9 or less, per sitting. Economy may be effected by avoiding undue multiplication of parts, and by disposing the section of the church in such fashion as to secure an agreeable proportion in each of its alleys without undue expenditure of material. The unit by which the eye measures the size of a church is the width of the nave bays. If these are unduly wide, and the scale is not restored by some device such as a subdivision of the bays, the church looks shorter than it really is. We must all have noticed how the adoption of sexpartite vaulting shortens an interior. On the other hand, if the features are too small, the church will look toy-like. The best dimensions seem to vary between 15ft. and 25ft., according to the size of the church. An agreeable proportion between height and width can generally be secured, whatever the size of the church, by the adjustment of the relative widths of nave and aisles. Thus, if a church be 60ft. across, and its nave 30ft. wide, the wall-plates must be, say, 40ft. from the floor, in order to secure agreeable proportions. If, however, the nave be reduced to 21ft. in width and the aisles proportionately increased, the wall-plates need only be 28ft. from the floor in order to obtain the same proportion as before. Unless ample funds are available, it seems a mistake to attempt a clerestory, because a one-story building looks much higher in proportion than one in which the height is subdivided into pier arch and clerestory. It is generally possible to obtain a sufficiently tall arcade to give dignity to the interior of a one-storied church, and if the aisle roofs are flat or span ones like the old West Country churches, a dignified range of windows can be contrived in the aisle walls. Where clerestories are attempted in small churches, it is desirable that there should be a considerable difference in scale between aisle and clerestory. Thus the clerestory may be subordinated to the aisle, as was commonly done in 15th-century parish churches, or on the other hand, the clerestory may dominate the design, like that at Malvern Abbey. The cheapest known form of church is that in which a single large slanting roof covers both the nave and the aisles. If this plan must be adopted for the sake of economy, it is still possible to secure good scale in the central alley by using bold arcades and large windows. In these cases the aisles must, of course, be sacrificed, and their windows must be small, perhaps square headed. Good hints for the treatment of such edifices may be gathered from the village churches in the timber districts of England, and from some French work. The detail of such buildings should, of course, be simple; and the extent to which simplicity may be carried without sacrifice of dignity may best be learned from a study of old work. A small and cheap, but most successful, village church was built some years ago by Mr. Harrison Townsend in a Surrey hamlet. There is a boldness and distinction about this little church which it is quite unusual to find in the generality of modern work, and its cost worked out at not more than £3 or £4 a sitting.

CROWDING AND CRAMPING TO BE AVOIDED.

Although, as has been indicated, it is possible, and often legitimate, to exercise parsimony in

adjusting the proportion of the cross-section of a church, it must not be forgotten that actual height is a thing in itself most desirable. Although lack of height can be neutralised by skilful disposition of the resources at the architect's disposal, it is a very false economy to attempt to save money by crowding the floor space of a church. The planning of altar, font, seats, and so forth are determined by the average sizes of the human body. A sanctuary should be roomy, not less than one, or, in large churches, two bays in length. Unless there is ample space, steps should not be multiplied, narrow and crowded steps being both dangerous and undignified, especially at the altar. The wider that pews can be spaced the better. If the site is cramped, it is better to introduce galleries than to crowd the floor space. Pews seem preferable to fixed rows of chairs, which are ugly and rickety, but there seems no good reason why a part of the church should not be pewed, and the rest of the floor left open and used only for movable chairs, as is often the case abroad. Roomy vestibules, screened off from the body of a church and fitted with swing doors, greatly add to its convenience and comfort, and may be advantageously introduced, even though they may necessitate the building of western galleries. Vestries and accessory buildings are too generally cramped in modern churches. As regards the position for

THE CHOIR AND THE ORGAN,

it is important that these should not be placed too far apart, nor be at a long distance from the altar in an English church, because large portions of the Prayer-book services take the form of verse and response between priest and people. The Continental plan of treating the musical part of the service as independent of the ritual—for instance, the performance of organ solos or anthems during the canon of the mass—does not seem likely to commend itself to English ideas. Except, therefore, in a very short church, there are objections to placing the organ and choir in a west gallery; though, if there can be two organs, the larger instrument should certainly be placed at the end of the nave, or of one of the transepts, where sufficient height is available to allow the larger pipes to speak properly. The common custom of placing the choir in the chancel generally works fairly well, and it seems a pity to abandon it for the mere sake of novelty. But in some very large and long churches, and in cases where there is a low and narrow chancel arch, the singers are best placed in the nave or in galleries facing each other like those at Milan, at St. Anastasia, Verona, and at Exeter Cathedral. These minstrel galleries may be used with a west-end organ. The best arrangement must, however, be determined by so many circumstances, that it is not possible to lay down a general rule for the placing of the organ and choir. The Italian plan of putting them behind the altar would not commend itself to English ideas.

CHAPELS

are convenient, indeed, almost necessary adjuncts to parish churches of any size. A chapel should be conveniently placed with regard to the entrance-doors of the church, or it should have an entrance of its own, and its heating and lighting arrangements should, if possible, be self-contained. Only two steps are necessary at a side altar, the footpace and the communion-step, as side altars are only used for plain celebrations.

THE TOWER.

The traditional position of an English church tower is upon the main axis of the church, either at the west end or upon the crossing. But there may often be circumstances that suggest some other position as best for the tower, such as the side of the nave or the chancel; and in such cases it is often possible to obtain fine internal effects by a judicious contrast of the massive supports of the tower with the lighter piers and arches of the rest of the church, as is done in the 15th-century church of St. Mary Steps at Exeter. The internal treatment of the tower is one of the great chances open to the church architect, and this feature has been handled in a remarkably masterly way by Butterfield at St. Albans, Holborn, at Stoke Newington, and at Rugby.

CATHEDRAL DESIGN.

Should it fall to our lot to design cathedrals or large collegiate churches, we should, unless we have very good reasons to the contrary, place the

towers and dispose the main lines of the building in a regular and monumental fashion, and it is very doubtful whether a happier grouping can be desired from the traditional English combination of a large central lantern with smaller belfries at the west end. The requisites of a modern cathedral are a nave sufficiently spacious for a large congregation, and a choir roomy enough for the cathedral staff and the senior clergy of the diocese. A new cathedral should not follow old monastic models in too literal a fashion. The ideals of the French cathedral builders of the 13th century, as exemplified at Paris and Bourges, have more in common with modern requirements than the monastic churches of our own forefathers. The plans of the French cathedrals are unbroken rectangles, with apses and double aisles and galleries all round, the choir and altar being in the middle, and in full view of the laity, who were admitted to the nave, the aisles, the ambulatories, and the galleries. This appears to be an ideal arrangement for a great national church, and possesses advantages that are lacking in the later French cathedrals, with their innumerable private chapels, and in our own minsters with their long, narrow plans and closely-screened choirs. The cathedral builders of the future should surely make the fullest use of modern constructive facilities and engineering skill in order to inclose great unbroken floor spaces with structures that shall be stable, fireproof, durable, and rust-proof.

Mr. E. PRIELEY WARREN proposed a vote of thanks to the lecturer for his scholarly and suggestive paper. Church architects needed to exercise their common sense, and a chancel arch, as Mr. Nicholson had suggested, was often a useless expense, and also reduced the apparent length of a small church. If brick was necessarily employed for a church, it was best to keep to the one material throughout, and not to introduce Bath stone for dressings, as such a practice produced a patchy effect. He had no objection to plaster, where cheapness was an object, if it were introduced frankly. The great aim should be to construct truthfully, and hence buttresses should not be introduced except where they were needed to resist thrusts. As compared with foreign churches, our old English churches were small and pitiful—doubtless owing to the comparative poverty of the country during Medieval days. A common fault was to build a church so as just to fit the estimated congregation, and thus the building was deprived of the qualities of spaciousness and dignity. It should be remembered that in building a church for more than 300 people it became increasingly easy to build economically as one enlarged the accommodation, for the voids rapidly grew. The affectation and obvious striving for originality of some modern church architects was very displeasing.

Mr. A. NEEDHAM WILSON seconded the motion, and expressed his regret that in modern churches the air of reverence, awe, and mystery was generally absent. He would do away with the east window—it overlighted the church and destroyed all sense of mystery. Why should not cloak-rooms for wet garments and umbrellas be provided in churches, as in theatres and concert halls?

Mr. G. H. FELLOWES PRYNNE referred with approval to the individualism apparent in all the churches of Butterfield, Pearson, and Sedding, and expressed his regret that the author had not touched on the important and practical topics of heating and ventilation.

In putting the vote of thanks, the President emphasised the danger of overheating a sanctuary, remarking that almost every church was too light. Style did not matter much; what the church architect needed was a devout and poetic feeling.

THE SURVEYORS' INSTITUTION.

THE opening meeting of the session of this society was held on Monday evening last at 12, Great George-street, S.W. In the unavoidable absence of the president (Mr. A. Buck), who was detained by an illness, from which, we understand, he is recovering, the chair was taken by Mr. H. T. Steward, Vice-President, and Mr. Buck's opening address as President was read by the secretary. The address was, as it professed to be, soundly practical, many sides of the surveyor's varied vocation being dealt with. Many of the great changes which had marked the last century were accomplished by the aid of the surveyor, and the vast engineering operations

and dealings with land which called for his co-operation were responsible for bringing forward from many a countryside the men who became the skilled advisers, the trusted arbitrators, and the agents into whose hands were committed interests representing hundreds of millions of money. By their agency land had been largely freed from the shackles and disabilities which formerly limited its satisfactory usufruct, either by tenants or owners. A great gain had been effected by the abandonment of the custom of renewing leases for lives and for years, the loss, to the Church especially, from the former system being almost incalculable. The surveyor had borne a considerable part during the last 50 years in the great public improvements which had transformed the face of our towns and cities, the provision of a good water supply, the sewerage of towns, the improvement and widening of roads and streets, the demolition of insanitary dwellings, and the provision of open streets; but there were still problems enough ahead to give scope to all the surveyors' resources of skill and knowledge. The problem of the congested areas was one in which hundreds of thousands had been spent, but which was still far from solution. Whether the process of decentralisation could or should be hastened by legislation was an open question; but he was himself no advocate for State interference where it could be avoided. Turning to agricultural land which, so far as we knew, seemed only adapted to growing cereal crops, which, at present prices, hardly paid for cultivation. Statistics showed that our imports of wheat alone amounted to the gigantic annual total of some 26 million quarters, while our payments to the foreigner for milk, eggs, cheese, and other minor products of the farm reached many millions a year. Co-operation might do much to help the farmer in these matters: new markets in large suburban districts and increased facilities of carriage involving less handling, and affording more direct access to the consumer, would do much; but still the lot of the agriculturist, landlord or tenant, was a hard one. He trusted that the old order would continue; but in many cases it would be a severe struggle, owing largely to the reduction of capital. Tenants had lost theirs, and landlords were rapidly becoming impoverished. To show the drift of things, Mr. Buck quoted figures, giving the total area of land under cultivation. During thirty years the arable land had decreased from 18½ to 15½ millions of acres, while pasture had increased from 13 to 17 millions, although the number of sheep had also fallen off. The competition of America, where the farmer could now accept as little as 23s. a quarter for his wheat, had reduced prices far below the remunerative level, and it was but a poor consolation to know that, as the conditions on the other side of the Atlantic gradually changed with the working out of the virgin lands, the export price must rise. This could hardly be in our time. Another difficulty which beset agriculture was the labour question. Whereas in 1870 the rural and the urban populations were nearly balanced at fifteen millions each, the former had now sunk to less than twelve millions, while the latter had risen to 29½ millions. In the country, as in the town, there was a general revolt against the "humdrum" of life. More pleasure and amusement was demanded, as well as shorter hours and easier conditions of work. The long hours, the poor wage, the monotonous existence, the absence of prospect, and the poor dwellings had led the agricultural labourer, in the light of modern education, to rebel against his lot. Whether it would be better by his migrating to the towns was more than doubtful. All that could be done to stay the exodus from the country was to make the conditions of rural life more attractive and to remodel our system of rural education so that it might have some relation to the needs of afterlife. And surely, while we were spending twelve millions in order to satisfy the natural instinct of the agriculturists of Ireland, some sacrifice of public money might well be made to keep our own fields in cultivation; and while our great urban and municipal bodies were doing so much to secure sanitary houses and healthy conditions for the town dwellers, there was room for the activity of the county and district councils in doing something to improve the lot of the agricultural labourer. Cottages on estates had been much improved of late years; but the labourer did not much love these isolated estate cottages, and if he found some attraction in the social life of the village or small town, who could blame him? In his own

county of Worcester, the President said, a good deal had been done in the direction of providing small holdings, and great success had attended the scheme carried out by the county council under the Allotments and Small Holdings Acts. The system of local taxation could not wait much longer for some reform. Taking railways as an example, Mr. Buck showed how great were the anomalies of the present method, and how impossible it was to arrive at any just and equitable incidence of the burden of rates. The growth of the local rates must come in time to have a very serious effect on the value of property, the increase being much greater than the increase of the population, and tending year by year to leave it further behind, while the growth of local indebtedness was becoming altogether beyond reasonable limits. That much of the money was wasted, no one could doubt, and that many of the expensive schemes carried out were in response to the often unreasoning demands of the Government authorities was equally evident. Systems of sewerage were often insisted on for small villages at a cost quite incommensurate with the advantages obtained. The only probable check to this extravagance would be the increasing difficulty of borrowing money, some of the lending bodies becoming already more cautious in advancing money to local councils and others without good security. Municipal trading should, he thought, be jealously watched. In some forms it was undoubtedly sound; but in some others it encroached on what were the legitimate bounds of private enterprise. It was also doubtful whether in every case municipal accounts are so audited as to show clearly the true financial gain or loss from the different undertakings. Next the President dealt at some length with the subject of main roads, predicting that with the advent of mechanical motive power new conditions would arise, and attention must be given to the adaptability of the roads themselves for the increased weight and speed of traffic. Whether the horse was to become extinct on our highways it was, perhaps, early to say; but that the next few years would see a momentous change in the conditions of local travel and transit no one could doubt. A proposal had been made, and seemed to have a solid base of reason, that the great arterial roads should be made national roads maintainable out of Imperial Revenue, and not subject to the present variable and inconsistent regulations of numberless local authorities. With a few words illustrative of the growth of the Institution in importance and in numbers, and an earnest appeal to the members never to forget the great interests of the profession, and above all to proceed with moderation and caution, avoiding sectional jealousies, the President brought to an end his interesting and able address, for which a cordial vote of thanks was passed to him, on the motion of Mr. H. T. Steward, seconded by Mr. C. Bidwell.

FOUNDATIONS.*

By BARON H. T. H. SICCAMA, M.I.C.E.

THE foundation is that part of a structure which supports the part built to fulfil an intended purpose. It is not always clear where the foundation ends and the superstructure begins, for instance, when foundations are utilised for cellars. As a rule, the foundations are below the level of the surrounding ground. The need of foundations indicates that the soil to be built upon is too soft or untrustworthy to carry, unprepared, the weight of the building, for on rock or other incompressible surfaces no foundation is needed. On compact, but still ductile, clays the total estimated weight of the structure gives the measure for the required width of the footings. But soils like clay in level strata, sand, gravel, and stiff loam, where there is no danger of disturbance by running water, may be left out of consideration. Foundations obtain their greatest importance in alluvial soils, where their cost is sometimes equal to that of the superimposed structure. If alluvial soils consisted solely of the inorganic deposits of rivers and streams that formed them, a sufficiently hard bed to carry weights might, in most instances, be found but little below the surface; but this is seldom the case. This is easily understood if the mode of formation of a delta is considered. The growth of a delta at the mouth of a river flowing into a tidal sea is a very complex proceeding, and subject to continual changes. The

first effect is the formation of shallows on each side of the mouth and parallel to the direction of the river current, as it leaves the unsubmerged coast line. These banks consist of matter precipitated from the volumes of river water flowing side ways, and losing their acquired velocity on meeting the heavier sea water. The centre of the fresh-water current continues seaward for some distance, and deposits its silt in the deeper water, forming a bar, from where part of it is either carried sideways by littoral currents or up river again by the incoming floods, and eventually to side shallows. As these warp up more and more, the real river mouth is displaced seaward, the surface gradient of the river becomes flatter, the current slower, the deposit in the river-bed increases, and the bar shallows. The river at last, finding its outlet insufficient, breaks through one of the side banks and makes a new mouth. The old bed being left without sufficient current shallows, and the bar at its mouth, no longer eroded, is raised by the surf acting on it, and overlaid with sea sand pushed up by the groundswell from the sea bottom. As soon as this sand reaches the surface, the sea wind dries and blows it into dunes high enough to keep out high tides; the old river bed is turned into a lake—at first brackish and then fresh. The salt and other constituents of sea water are precipitated or absorbed by plants, reeds, or floating water lilies that soon begin to appear in the stagnant water; first round the edge. This green band broadens, and at last covers the whole surface, and as the plants decay grasses and morass plants cover the floating mass, thickening it; then trees with wide spread roots begin to grow on it till their weight becomes too great for the floating soil. They either sink through to the bottom, or, a gale assisting, are thrown sideways, and so increase the thickness of the now tangled mass of vegetation. So the process goes on for some time, till river-mouth number two undergoes a similar fate to the first, and the river, seeking a new outlet, breaks into the lagoon, and covers the vegetation with layers of silt or sand. The sea in flood finds its way into it as soon as the river breaks through the side banks, kills what remains of plants, and turns the whole into a putrid, festering slough, till through another change by the river it is again cut off from salt water. Then, as soon as the lagoon loses its salt, fresh-water vegetation, marsh plants, reeds, trees follow one another in covering the surface. But below it the hollows and depressions above, harder inorganic strata are still filled in with the remains of the former growth, intermingled with layers of sea clay or sand, river clays, and gravel, or other deposits. In each successively abandoned river-mouth the same goes on, and the delta spreads out fan-wise and seaward, composed of numerous compartments filled with mixed organic and inorganic stuff, and divided by ridges of clay, loam, or sand. Through all these different marshes and lagoons the river continually changes its course, dividing into two or more arms, abandoning an old outlet, or revisiting another old one. It is the mixture of all sorts of stuff in alluvial soils, inorganic and organic, in layers of varying thicknesses, and divided off into areas of irregular form and size, which causes such sites to be the most untrustworthy and difficult to be built upon, and where human ingenuity in the matter of foundations is most called forth. In the early days, when in these swamps and marshes constructions of any weight are wanted, the first idea to suggest itself would be to distribute the load over as great a surface as possible, and this could be obtained by means of a raft. Where timber was abundant, beams could be used; if heavier material were lacking, smaller trees and branches intertwined served the same purpose. Such old raft foundations may still be found under ancient buildings. On the alluvial plains of British Guiana, first brought under cultivation by Dutch settlers, some still exist at the present day. Even old brick windmills, chimney shafts on sugar estates, and the brick lighthouse at Georgetown stand on rafts made of two or three tiers of heavy greenheart or mirva barks. In the fens of the Netherlands and of Northern Germany are still some old farmhouses resting on an even less coherent bed than a thick matting of branches and faggots afford. Probably for the want of better material in the vicinity, layers of dried peat, cut in long pieces and in several tiers at right angles to each other, served as foundations. Not only for buildings were these spread-out supports used, as is proved by part of an old Roman road through

* Read before the Civil and Mechanical Engineers' Society on Thursday, Nov. 5.

a peat bog, discovered some years ago, constructed almost entirely of logs lying close together in two layers, the lowest parallel to the axis of the road, the other across it, and the interstices filled in with small branches—a regular corduroy road, like some in the swampy districts of the United States at the present day. With the same idea, that of spreading the load over the support sand foundations accord, sand compressed in a confined space gives as hard a bed as can be desired for most purposes. In old alluvial soils the different strata, as a rule, increase in compactness as they are lower down, and although the first few feet from the top may be so soft that cattle in wet weather get bogged in it, yet after this nearly liquid mud is removed, layers may be found which, although yielding, are capable of supporting some weights. What this may be must be ascertained by experiment, conditions being so variable that a hard-and-fast rule does not exist. On the green surface, a galloping hare may shake the ground for thirty yards round; a few feet below it the soil will support a ton per square foot; while again, a few rods off, a quarter of a ton per square foot will settle down more than is convenient. Particularly in soils of such varying compactness, sand gives a very good support, provided that it is not scoured away by running water or blown away by the wind. The sand may be piled up on the surface by its weight compressing the mud underneath it; but a more workmanlike way is to remove the upper mud by digging a trench or a pit many feet wider than the footings of the buildings are to be, and going down to a harder layer. This trench or pit is then filled in with sand, which will settle downwards and sideways till an equilibrium is obtained. As the top of the sand descends, the soil round it heaves up in a sort of billow, often higher than the sand mound. Sometimes the sand not only compresses the layers below it, but pierces them and sinks down to a considerable depth. If, then, borings are taken, they show that the sand made a way for itself in a very irregular way, very different at different cross-sections, mostly in the form of a rounded body, bulging out here and there. This bulging out sideways may go on after there is no settling down observed, and then more sand should be supplied to fill up the space. It is curious to note that these after-workings most often occur at night, and not seldom after the ground has been violently shaken by pile-driving or otherwise. When once stability is obtained, and neither sand nor surrounding ground is moving, the top side of the sand can be levelled off and the footings laid on it. The peaty, boggy soils owe their character to the great quantity of water they contain. The trench or pit, therefore, will be filled by it, and the sand tipped in should reach to high above the surface of the surrounding subsoil water, or else it will, for an inconveniently long time, be more like a quicksand than a sand plate. It is even advisable to heap a mound of an extra 5ft. or 6ft. over it to press the submerged bottom layer down, and then, if possible, to lower the water-level. Even then the sand will remain compressible, and it is as well to give it a good ramming-down before laying down the footings, or else the eventual settling will be more than convenient. In the present day concrete is the best material for the footings, laid down in slabs. Where they are to carry a compact structure, like a tower or chimney, a few layers of cement mortar will be sufficient; but where it concerns long walls, iron rods running lengthwise, bedded a couple of inches above the bottom in the concrete of the lower slab, and also a couple of inches from the top of the upper slab, will give greater security against unequal settling and fissures in the wall. The width of the footings and their thickness, and the sectional area of the trench, must be determined by experiment on the spot. A trial pit filled with sand, on which is placed a load of some heavy substance, is not expensive. It should, however, be of sufficient area to give a staple base to the load to be imposed on it, or else this will topple over, or settle sideways, leading to erroneous conclusions. Sand foundations are a very ancient device. Some Egyptian temples in the Lower Nile delta are built on them. The builders placed little images of their gods and holy animals in their foundations, which seems to have answered very well, as most of these temples still stand; but nowadays iron rods, as described, will perhaps inspire more confidence. In recent times sand foundations have again been used; for instance, under railway buildings and workshops on the north

coast of Java, and for lines of railway in Holland; for the Law Courts at Georgetown, British Guiana, and so forth. Another long-known system is that of piles. Even the lake dwellings of prehistoric times were principally built on them: driven in vertically or nearly so, into the lake bottom, and united at the top by heavy timbers, forming a floor for the huts. The same type may still be met with in the Tropics in some coast villages, that stand several feet above the surrounding water or land. The white man's practice at present is to drive the piles down out of sight. It is curious to observe how erroneous ideas have crept in about the usefulness of a pile foundation. It is thought by many that the driving of a sufficient number of piles consolidates the soil, whereas it is just the reverse. The piles themselves, and the shaking during the driving, destroy such cohesion between the different strata as may exist, and churn the whole up into a quagmire. If driven in great numbers they really act like a raft of which the beams are placed vertically instead of horizontally. This applies specially where the piles do not reach a layer hard enough to support them and their eventual load, in which case they miss their purpose, namely, that of supporting a platform, like a table on its legs. Many buildings stand out of plumb, because the whole mass below piles and mud is bodily pushed over through a lateral thrust or inadequate support, a heavy load on one side or an excavation. Some thirty years ago a dock-wall in the Isle of Dogs slid sideways in this way. Besides, by their buoyancy the piles counteract the action of gravity by the friction of the surrounding matter, however porous and soapy. In driving a long pile, the first few feet may go down rapidly by its own weight, and the rate of sinking after that becomes less at every subsequent blow, and then remains stationary. If in the end a hard stratum is not reached, and the pile is left alone for twenty-four hours, then it takes several blows before any impression is made owing to the adherence of the soil to the surface of the pile, and should ramming be stopped after a few knocks only, the idea is given that the pile stands in firm ground. This leads to grave misapprehension, for when the full permanent weight of the building is at last superimposed, a considerable and slowly progressive settling is observed going on for years, till at last the platform over the piles compresses the subsoil sufficiently, and acts, more or less, like a raft. Where piles are not driven down into holding ground, another inconvenience may be suffered, most of the piles already driven being pushed up again, whilst others are put down nearly even after they have already been fastened to the sleepers or stringers that are to support the wall footings. Where piles remain in this way—so to say, floating—it is useless to try to obtain increased stability by driving some in a slanting direction. But in every case the construction of the timber platform is of great importance, not only because it must be able to carry the weight of the walls between the piles, but it must bind these together so as to distribute the load evenly, and also prevent the upper parts of the long masts from bending sideways. Another error is the use of a pile foundation where a hard sand-plate is met with at little depth beneath the surface. An old sand stratum is very difficult to pierce; and where this succeeds, and the piles are not shivered and split before they are half-way down, the sand is all around disturbed and broken up. Not much harm is done where the timbers are constantly submerged in fresh water; but when *Teredo navalis* can get at it, disaster is sure to follow, for the sand disturbed during the operations ultimately settles down again, and leaves space filled with clear water, where the sinister worm soon enters. Where a foundation is intended to support a lock, and the hard sand-plate is not too far down, it is preferable to tip the concrete in it on to the sand bottom, if covered by water, in hard lumps of stale or half-set mortar. In this way a watertight dam is obtained, whereas in the other case some leak is sure to ensue between the sand surface and the lower face of the lock or sluice bottom. Where a sufficiently hard stratum is overlaid by soft stuff to such a depth that the longest procurable masts cannot reach it, wells can be used. This in a way is not a new invention neither. In India wells have been known since time immemorial, under weirs in rows close together, under bridges in clusters. In this way the movable sand or other untrustworthy material is traversed, and the solid or rock bottom underneath is reached. The work is similar to that of sinking

a shaft. A wall is built on a circular shoe, the inside is excavated, and as the wall sinks down other sections are built on top. There are instances in Europe, in Venice, where a wooden cooped well barrel was used, hooped by iron bands, and driven down by the weight of sand-bags arranged round the top. There, as in India, when the well had gone down to the required depth, it was filled with stones or other material. If this filling is not of itself cohesive, there is danger that, when the wooden barrel staves decay, the inclosed substance may spread and the building come down. The cast-iron cylinders filled with concrete of our time are a vast improvement on the older methods, as screw piles are much superior to driven ones, where, for some reason or other they have to stand in sand, as in the case of a lighthouse or landing pier, for the sake of economy. The methods by which cylinders can be sunk are manifold, and the choice depends upon the nature of the soil and the depth to which they are to go down. In clay or stiff loam a bucket and chain or a grab and crane must be used. In sand or soft stuff suction-pumps are preferable. The great bother is to keep the cylinders plumb while going down, which is not always a very simple thing, especially where big stones, or more often old half-decayed logs are met with. If they do not prevent the cylinder going down altogether, until they are removed, they are apt to drive them sideways as is sometimes the case with a bore hole. If very large cylinders or caissons have to be put down to a considerable depth, the soil is excavated through compressed air chambers. On the so-called Potts system, which is costly and rather risky, it is on the whole a favourite device of engineers who need not themselves work in the air chambers. If possible it is always preferable to work in the open air. Even divers should be employed sparingly. Their work cannot always be depended upon: it is slow, dear, and not easily controlled. Any one who has ever been down in a diving dress, will understand this well enough. Dressed in a suit of plate harness, and picking up pins out of the mud during a thick fog, would be something like a diver's work, and yet not half so tiring or dangerous. A new kind of foundation is that of the sand pile. For this a hollow iron shaft is tipped at one end with a loose fitting pointed shoe, and driven down to the proper depth. The shaft is withdrawn, and dry sand run down it. This fills the space left by the shaft as it is raised. The shoe abandoned, very bad ground may be improved and rendered more compact this way, but under locks, sluices or weirs, it is not of much use. Whether "pierre perdue" or rip-rap is a good foundation depends on circumstances. In a breakwater it is part of the useful construction which begins at the bottom. The slope under which a rip-rap mould will stand depend on the size of the stones, and on the exposure of the site. The smaller stones should be tipped in for the centre, the highest on the outside. Mostly rip-rap mounds are used in the construction of breakwaters; but the building of a breakwater is another story, and lies outside our present subject. For quay walls in deep water, such stone mounds will give good foundations, unless the bottom is too soft, and then the stones will go to unknown depths and be lost—as was the case in New Orleans once, also in Rotterdam. In the construction of docks and navigation works it is a mistake to make them too permanent and costly. Nothing changes so continually as the needs of traffic by water, and the best policy is to provide what is needed at the moment, at the least cost, and nasty, if you like, which, in this case, may be called "business." Granite quay-walls, Gothic warehouses, director's names in golden letters on marble slabs, festive opening lunches, with plenty of speeches and lots of champagne, is art, and lies outside the scope of this paper. It would be indiscreet to frivel away more time on this occasion, and therefore it is better to wind up with this remark—that the best foundation is the one which serves its end at the least cost.

Maxwell-town (near Dumfries) Town Council have accepted the offer of Messrs. G. M'Kay and Sons, Edinburgh, to carry out drainage and sewage purification works for the burgh at a cost of £11,441. The system of purification adopted is the bacterial, and the works will be situated on the lands of Troqueer Holm, adjoining the Nith, into which the purified effluent will be discharged. A contract of a similar nature, but larger dimensions, is in course of being carried out for the burgh of Dumfries.

PROPOSED NEW MAIN ROUTES FOR LONDON.

THE London Traffic Commission resumed its sittings on Friday at the Westminster Palace Hotel, Sir David Barbour occupying the chair. Mr. William Edward Riley, F.R.I.B.A., architect to the London County Council, was the only witness called. He said that the municipality of Paris had adopted as a basis of consideration the underground railways of the County of London when they began to scheme their system of direct communication. A unified and complete system had been evolved. There were six distinct lines, all worked on the shuttle system with looped ends to facilitate the return of trains running in each section. There was a difficulty in adapting such a scheme to the existing railways—viz., the inner and outer circles of the Metropolitan and Metropolitan District lines. An ideal scheme for London would be one giving circumferential lines at various distances apart and crossing those diametrically by other lines running across the county and joining the circumferential lines with the central points. The existing and authorised electrical systems, of which only the North-West London and City and Brixton tubes are now in course of construction, are made up of a series of irregular lines which, as at present arranged, do not constitute a unified system. Further, he would suggest broad avenues converging towards the central areas of the county, which would materially increase locomotion facilities. These avenues would provide for underground as well as surface locomotion. The underground systems of all the diametrical lines, both tube and shallow underground, might be looped at the outer ends, as in the Paris system, in order not to obstruct possible future extension. The witness pointed out that the want of rapid communication was particularly noticeable between centres south of the river, the Elephant and Castle, and Waterloo and London Bridge Stations, and centres on the north, among others, Charing Cross, King's Cross, Piccadilly-circus, the Bank, and Ludgate-circus. Certain tube railways now under construction and projected would very materially improve the means of communication. In some cases shallow subways or tramways might be adopted. A route from the Marble Arch to Cricklewood would be of great convenience. The witness detailed an elaborate scheme for linking the railway termini. One great advantage would be to extend the Great Northern and Strand tube from the Strand (its proposed terminus) under the river to Waterloo Station, thus forming an approximately north and south line. Tramways should, where practicable, approach nearer to the centres of traffic north of the river than at present. Additional routes were required (1) from Highgate, via Hornsey and Alexandra Palace, to Tottenham; (2) Clapham Common to Tooting; (3) through Poplar to Eltham, via Greenwich, returning via Lee, Lewisham, New Cross, Deptford, and Bermondsey, and crossing the river to a point near the Monument; (4) from the junction of Sloane-street and Knightsbridge, along King's-road, and crossing the Thames to Putney; (5) an extension to Willesden Junction of the Baker-street and Waterloo Railway from its present authorised termination at Paddington; (6) Walthamstow, through Leyton, entering the City by Bethnal Green; (7) Queen-street, through Peckham, and ending at the Crystal Palace; (8) from the Marble Arch to Victoria and Vauxhall. The lines of forming new and broad thoroughfares might be chosen to pass through inexpensive property, avoiding the purchase of costly interests such as would be required in the extensive widening of existing streets. By acquiring sufficient property on both frontages and providing for surface tramways and shallow tubes a return from the necessarily heavy outlay involved would be obtained. The witness, continuing, suggested (1) a north and south route, north four miles long, and south 6½ miles (within the county), from Southampton-row northward to Finsbury Park, and southward to near Sydenham Station; (2) a north-east and south-east route, length within county, north-east 4½ miles, south-east 8½ miles, the former beginning near the Tower of London and terminating at the county boundary beyond the south end of Hackney Marsh, and the latter from the southern approach to Tower Bridge via Eltham to the county boundary at Westwood; (3) a south-west route, length 4½ miles, from the western end of the Victoria Embankment to Barnes

Common; (4) west, length two miles, from Uxbridge-road to East Acton; (5) north-west, 2½ miles, beginning at Portland-place to the county boundary north of Paddington Recreation Ground. The usefulness of the avenues would be greatly increased by their extension across the central area in cases where that was not shown. Comparing the cost of housing at the Council's estate at Tooting and at the Bourne Estate (Reid's Brewery), he said that a family of six could be housed at Tooting for about five-eighths of the cost of the land only at the Bourne Estate.

STEEL SASHES, METAL CASEMENTS, AND GATES.

MESSRS. HAYWARD BROTHERS AND ECKSTEIN, LTD., 187-193, Unicorn-street, Borough, S.E., have just issued a new illustrated catalogue of casements, sashes, collapsible gates, fireproof floors, and other fittings and appliances, which have a special interest for architects engaged in warehouses, factories, railway business premises, stables, &c. The metal casements, illustrated are of improved type, and represent outward-opening and inward-opening casements, side and top hung. The full-size details of these ought to be of value to architects and others in specifying and ordering. These show in section a simple bar metal frame and casement. The prices are moderate. Thus, for a height of opening of 4ft. to 4ft. 6in. the price of style A, fitted with brass cockspur, plate, and stay, is 30s. 6d., and of style B 24s. 6d. Transom lights, fitted with gunmetal stay, &c., are illustrated. A stronger section, well finished, costs a few shillings more, while a still stronger section, No. 16, with middle rib and moulded casement frames, is suitable for any purpose. Horizontal and vertical pivot-swinging casements are useful in some positions. These are numbered according to strength and finish, and full size details are given in each case. Folding casements with meeting stiles are well adapted for dwellings and cottages where there is no mullion. In every instance the widths can be increased and circular heads substituted at extra cost. Other illustrations show hepper ventilators with fall-back casements. The fittings, handles, stays, &c., are of various improved forms of iron, brass, and gunmetal. Hayward's new improved and patented "putty-grooved" wrought steel sashes are neat in appearance and strong. Several sections of bars are given. The mitred joints are made by special machinery. Fixed as well as opening sashes are made, and circular and semi-circular sashes. By referring to the tables any size or description can be found. Cast-iron sashes of two patterns are also made. Hayward's "Pludelux" prismatic glass for use in sashes, cut to any size up to 80in. by 60in., is an admirable light refractor, and is made of sheets one side moulded into fine corrugations; they can be fitted into wrought-iron or wood frames. The "Pludelux" prismatic glass is made with different angles, and can be applied with great advantage in the upper sashes of windows or above transoms, as shown in a sectional view. The New Surrey Works of Messrs. Thos. Green and Sons' new premises, Southwark-street, are fitted up entirely with Hayward Brothers and Eckstein, Ltd., metal casements and sashes, a view of which premises is given. The section on Hayward's patented "steel collapsible gates" illustrates several applications. They are useful for entrances to shops and buildings, lift openings, windows, &c. The double H section is adapted for large and heavy gates. Few modern buildings are complete without the collapsible gate; they are made of several types, according to the number of lattices, and several pages illustrate these, so that any description can be specified with the aid of table of price list, which gives the full height and width of gate. The collapsible steel window-guards and screens are useful protections. Photo. views of these gates are given. Hayward's iron sliding doors, with interlocking rebate angle-irons at sides, and pivot-hung doors, single and double, form a very important section. The lifts and hoists and well-known Hayward's cellar-flaps are too well known to need description. The catalogue is handsomely got up, and is profusely illustrated.

As a result of the recent inquiry, the Littleborough Urban District Council has received the formal sanction of the Local Government Board to a loan of £1,370 for the purposes of electric lighting.

IRISH BUILDING STONES.—II.

ARMAGH.

THE rocks in this county are Lough Neagh Beds, Triassic and Permian, Carboniferous Limestone, with sandstone and shales, Silurian sandstone and slates, metamorphic rocks, granite, basalt, and other igneous rocks. Armagh is built on Triassic sandstone, Permian breccia, and Carboniferous Limestone, with Lower Carboniferous sandstone and shale. Lurgan is on basalt, and Portadown on basalt and alluvium. In the extreme north of the county, bordering Lough Neagh, there is found a series of beds consisting of plastic clays, sands, and subordinate layers of lignite and clay ironstone, the whole being much more recent than the basalt adjoining, and which forms the southernmost portion of the great Antrim sheet; these beds have received the distinctive name of the "Lough Neagh series." Towards the east, the clays and lignites rest on basalt and white limestone; towards the south they cover up the Triassic rocks and Carboniferous Limestone; they are of very unequal thickness, having been proved to a depth of 270ft. only, though from the lamination, which Kinahan presumes to be a false stratification, the thicknesses should be as much as 2,000ft. These beds, like the older rocks, have suffered much denudation, and their surface area was once considerably greater than it is at present. The Lough Neagh series are remarkable as having furnished much silicified wood and Lough Neagh bones. The silicified wood was noticed centuries ago, and the common belief was that Lough Neagh water had the power of petrifying wood. Both the wood and the bones come from the lignite, as portions of the latter are frequently found completely silicified, and lignite when bleached is exactly like a Lough Neagh bone. The silicified wood and the bones represent various stages of the silicification of lignite; all the beds are at present provisionally classed as Pliocene, though Jukes was in favour of classing them as Pleistocene. Other geologists think the upper beds are still more recent, and that they are of the same age as the Drift of the surrounding country. The whole northern portion of this county was once covered by the waters of Lough Neagh; but earth movements caused a slight tilting up of the southern end of the lake, and this has laid the bed dry in this direction, exposing the clays and lignite of the Lough Neagh beds. Triassic rocks are found in an irregular tract stretching eastward from the Valley of the Blackwater to the basalt of Portadown. There are no good surface exposures of these rocks along their southern margin; but well-sinkers find them to be soft red sandstones, probably representatives of the Bunter beds. In a few places along the Valley of the Colleen red shales and reddish-grey sandstones are found, which apparently belong to the Keuper beds. There are extensive surface exposures on the northern side of these Triassic rocks, and they are all Bunter sandstones associated with thick beds of mottled clays and shales. Formerly these New Red Sandstones, or "Red Free," as they are called, furnished much building stone; but latterly the quarries have been abandoned, and Scotch and English stones used instead. A quarry at Grange, north of Armagh, furnished the fine sandstone used for walling in the cathedral restoration of 1835; but foreign sandstones were used for the dressed work. Near Reilburn, close to Armagh, a calcareous breccia was quarried for flagging; it was found in the bottom of the Trias, or so-called Permian beds. Strata consisting of about 20ft. of sandstone, breccias, and conglomerate are found covering the limestone rocks south of Armagh; these were first noticed in the old marble quarry there. On the north-east of the city, in the valley of the Blackwater, near Benbush, similar red and purplish rocks are seen, the whole of which are classed as Permians by English geologists. Professor Kinahan points out that the red sandstone contains no fossils which would give a clue to their geological position; but then the associated limestones have fish remains of decidedly Carboniferous age, similar to those found in the Ulster Culp and the Burdie Home Limestone, Scotland, so that the real age of the so-called Permian strata is, after all, doubtful. Though these beds were formerly much used for building, the quarries are now all closed. Carboniferous Limestone is found on the north-west of the county, its southern boundary being a line running almost north-east and south-west, a little to the south of the City of Armagh. Some of the rocks are like Lower Limestone shale and Old Red Sandstone, others like the upper

limestone, which latter Professor Hull considers to be Permian. The chief limestone quarries are Ballygansey, Mr. G. Thompson (11 men); Farmacally, Armagh, Mr. P. Corr (11 men); Lisadian, Mr. G. Thompson (5 men); Navan, Armagh. Messrs. Leeman (3 men); Mullen, Tynan, Mr. Greacen (2 men); and two quarries at Enagh worked by Mr. A. Busby and Mr. J. McAree. The Armagh marble quarry in these Carboniferous Limestone rocks was at one time very extensively worked for building stones and marble, the latter being used chiefly for chimneypieces and ornamental work. There were four kinds of marble found in this quarry, the uppermost being a bluish-red stone 10ft. thick, in beds of from 1ft. to 3ft.; a bed of rock 3ft. thick called white marble, but really a light whitish grey, came next; then 2ft. under the latter was a shell marble about 1ft. thick, purple-brown, variegated with green and yellow; the lowest being thrush marble, a purplish rock mottled like a thrush's breast. The Armagh marbles have been completely displaced by Cork reds and foreign marbles, the latter chiefly Belgian. The limestone was used in building the R.C. Cathedral in Armagh; Tynan quarry and one at Killyles furnished limestone for the bridges on the Ulster Railway. Limestone from quarries at Aughnacote and Carrickaness were used in building Roxburgh Castle, and that from Farmacally in the Primate's Palace, Armagh. Ordovician (Cambro-Silurian) rocks cover the greater part of the county; they are slate rocks with associated beds of grit. The former are preferred for walling, and a good quarry at Carricalane furnished all the walling-stone used in Gosford Castle. At present neither the grits nor the slates are much used for building. Igneous rocks are found in this county west and south of Newry; they are probably the roots of the great basalt rocks of Antrim, Down, and here. The most important quarry is that at Altnaveigh, near Newry, worked by the United Granite Company, Ltd., with 58 men. The felspar in this rock is fractured throughout, and the outlines of the crystals are exceedingly ill defined; the mica is granular and less scaly than in the Goragh Wood granite. A peculiar arrangement of the mica in irregular lines gives a gneissoid aspect to the rock. Brown sphene is abundant, and a few hornblende crystals may be seen in places. There are no other accessory minerals. This is a grey granite. Bessbrook granite is quarried near Newry by Mr. A. Robinson, who has two quarries, giving employment to 26 men. The felspar in this rock is plagioclase pheno-crystallised, more angular than in the Bessbrook or Goragh Wood granite, but still ill defined. Mica is present in extremely minute particles, which gives a mottled appearance to the rock; it is biotite. The quartz is fine-grained; sphene and hornblende are accessory minerals, the colour being generally dark grey. This granite appears to have been much disturbed in cooling. Goragh Wood granite is called by Kinahan a spotted elvan; it is worked by the Newry Quarries, Ltd., with 17 men. The felspar in it is plagioclase, the crystals of which are fractured and imperfectly formed throughout; the interstitial quartz is present in much less amount than the felspar, and the mica, which is solely biotite, is present in badly-formed crystals, which are much abraded; no accessory minerals can be seen by an ordinary hand-lens, and the rock taken altogether may be described as granitic. The other granite quarries are Carrin Hill, Killeavy, The Newry Quarries, Ltd. (57 men); Corrinshigo Newry, Messrs. Murray and Sinclair (26 men); and another quarry at the same place worked by Messrs. G. White and Co. (9 men). All the Armagh granites are quarried near Newry; they are light and dark grey rocks of more recent age than the Chalk, they make good paving setts, and have been much exported to England. Basalt is quarried at Killycomain, Portadown, Mr. J. Collen (15 men); Glenane, Messrs. Gray and Sons, Ltd. (5 men); Annacramp, Mr. J. Scott; and Tullyhugh, Mr. W. H. Atkinson. There are 336 quarries shown in this county on the Ordnance maps, but there are only 19 worked at present which are over 20ft. deep, and therefore subject to Government inspection.

CARLOW.

The rocks in this county are Coal Measures; Upper Carboniferous Limestone (303); Lower Silurian Strata as deposited and subsequently altered; Intrusive and Metamorphic Granite, and Elvan. Carlow Town is built on that division of the Upper Carboniferous Limestone known as Calp, Leighlin Bridge on Calp and Magnesian

Limestone, Bagenalstown on Magnesian Limestone, Granite, and Calp. It must be noted that the Magnesian Limestone referred to here is not that of the Permian formation so well known in Yorkshire and Durham. In Ireland this is absent; but many beds of Carboniferous Limestone have been changed to Magnesian Limestone since they were first deposited, apparently by some kind of metamorphic action. Calp is an earthy black limestone or shale, commonly used for rough walling. Nearly the whole of this county is covered with granite: a line drawn through Carlow and Bagenalstown roughly marks its western boundary. Coal measures are the newest rocks found here, and they lie on the extreme west to the north and south of Old Leighlin, where they cross over the county boundary from the Kilkenny and Queen's County Coalfield of which they form part. The associated sandstones and grits have been extensively quarried for building, and they proved good weather stones suitable alike for dressed work and walling; a fine example of the sandstone may be seen worked into ornamental dressings in the doorway of old Killeslin church, which stands a few miles west of Carlow town on the Castlecomer Road in the Queen's County. These coal measure sandstones are silicious, and of a brownish-grey colour; the beds lie horizontally in layers of from 10in. to 24in. thick; quarrying, therefore costs little, and the stones come out of the quarry as well bedded and jointed as if they were specially dressed for building. All these sandstones belong to that division of the Carboniferous rocks known in Ireland as the "Carlow flags," as they lie directly on the limestone they probably represent, the Yoredale rocks of the Northern English counties. The Carlow flags of commerce are quarried in the adjoining county of Kilkenny, none being worked in Carlow at present; they are extensively used for rough flooring in Ireland, where such work is known as "flagging," in England it would be called "paving"; but "paving" in Ireland means a floor laid with small limestone boulders, such as are dug out of the Eskers. Carboniferous Limestone runs in a narrow belt from Carlow town to Bagenalstown, between the Granite and the Coal Measures, where it is seen overlying the former, and dipping or disappearing under the latter. Where the limestone rests on the granite, the former is unaltered, therefore the Carboniferous sea-bottom must have been a denuded granite surface when the calcareous mud was thrown down on it, and the adjoining granite hills were islands in that sea. This view is supported by the fact that granite blocks are sometimes found included in the limestone, these blocks having been derived from the main granitic mass. The typical Carboniferous Limestone of Central Ireland is a semi-crystalline, bluish grey, nearly pure carbonate of lime. In this county, however, it is chiefly a dark iron-grey dolomite, though limestones of the Calp type may be found in some places. At Browne's Hill, close to Carlow town, the limestone is a dolomite; but as it is much honeycombed with drusy cavities—that is, holes filled with sparry substances—it is only fit for rough work. A 4ft. bed of fine-grained bluish-grey compact stone found in the same quarry makes good dressed work in walling or facing. The Lower Carboniferous Limestones of this and the adjoining counties are nearly always bedded dolomites, but that they were originally deposited as such is not known for certain. Some geologists think they were once like other normal calcium carbonate rocks, and that they were subsequently altered by the introduction of magnesium carbonate, and the removal of a corresponding amount of calcium carbonate. However this may have been, both types of rock are constantly found interbedded in the Irish limestones. In Carlow town, two quarries were formerly worked—one in Montgomery-street, and the other in a suburb called Graigue, at the other side of the Barrow, and really in the Queen's County;—both in limestone rock. In the Montgomery-street Quarry there were beds 7in., 2ft., 3ft., and 18in. thick, all of which yielded a kind of marble, the thinnest layers furnishing the best quality. In the Graigue there was a 5ft. bed of crystalline limestone, and under it a 2ft. bed of black limestone, which was really a good marble. All these beds were worked for tombstones, the principal markets being in Dublin and Waterford; and so celebrated were the quarries at one time, the stone they produced was eagerly sought after for monumental purposes all over Ireland; but this

industry has now died out, and the quarries are closed. At Cloghennan, two miles and a half south-west of Carlow, a bed of good black marble spotted with white was worked in the upper limestones immediately under the Coal Measures. It somewhat resembled the curious crinoidal limestone of Clonmacnoise, in the King's County; but its texture was not so fine as that of a similar rock quarried at Royal Oak, near Bagenalstown. The principal quarries now in the Carboniferous Limestone are at Royal Oak: they are worked by M. Brennan, M. Timmins, and John Roach, over twenty men being engaged in them. Limestone gravel taken from these quarries (supposed to be the best and purest from clay in the county) is sold as raised for 6d. per ton. Ballyellin Quarry has recently been closed; it was worked by W. Devine. Though the Milford quarry is now worked by road contractors, stones of the largest dimensions ever likely to be wanted in building could be easily obtained in it, and of good quality. The weathering properties of stone from Milford quarry can be judged from an examination of the railway bridge at Powerstown, which is built with it. A good quarry at Brown's Hill yielded a dark-blue limestone, which made excellent ashlar walling; but the presence of drusy cavities in it unfitted the stone for use in dressed work. It was, however, extensively used in many of the buildings in Carlow town. Nearly all the limestones referred to are sold by the ton weight at the quarry undressed. Lower Cambro-Silurian, or Ordovician rocks, are found on the east side of the granite range between Cloncal and Kildavin. They are part of the great tract of Silurian grits, flags, slates, and shales which occupies most of the counties of Wicklow and Wexford, and they probably represent the Llandeilo rocks of North Wales. Where these water-formed rocks are in contact with the granite, and for several hundred feet round, they are altered or metamorphosed to schists and gneiss, in which crystals of andalusite, staurolite, schorl, felspar, and other minerals are plentiful. Though none of these older rocks are at all suitable for dressed work, the schists and slates are used locally for rough walling, but there are no quarries of any importance in them. With the exception of the small tract of Silurian and older rocks just described, the whole eastern part of this county is occupied with granite, which forms part of the celebrated Leinster range, this being 70 miles long and 17 wide, the greatest surface exposure of that rock in the British Isles. Like all other granites, this was consolidated under enormous pressure, for if the molten matter from which it was derived had reached the surface, it would have cooled there as a porous vesiculated pumice, a basalt, or some other igneous rock which would not have been granite. The only conceivable pressure to which this rock could have been subjected was that of the superincumbent Cambro-Silurian strata, and these were then of enormous thickness. All this immense mass of rock has since been removed, and with it much of the granite intruded and forced up through it. The age of the granite range is therefore easily determined; along its eastern boundary the old Silurian rocks are forced upwards, dislocated and altered by the intrusive granite, whilst along its western side the consolidated and denuded granite is covered with unaltered Old Red Sandstone and Carboniferous Limestone: hence this mountain range is older than the sandstone and newer than the Silurian schists. A close examination of the structure of the rocks here shows that granite of at least two distinct ages are mixed together, for the original mass which invaded the Cambro-Silurian strata was itself invaded by another and later eruption. Leinster granite is remarkable in that it possesses a structural peculiarity which gives it grain, and this reduces the labour in working it very considerably, for the rock splits readily along planes nearly at right angles to each other. It has been assumed here that granite is an igneous rock; but its origin has for a long time been rather a vexed question with scientific men. From the manner in which it is found to penetrate every rock with which it comes in contact, geologists assume for it an igneous origin, but that a great abundance of water is absolutely necessary to its formation is a sufficient reason with chemists to claim for it an aqueous origin; indeed, many of the latter look on it as a chemical precipitate from aqueous solution. It is undeniable that the quantity of water found in granite gives it a specific gravity due to aqueous and not to igneous solution, and the presence of large quantities of

water in one of its constituent minerals, mica, is admitted to be inconsistent with the theory of igneous fusion. Haughton, a celebrated authority on the subject, believed that although granite is usually a Hydro-Metamorphic rock, it may occasionally be the result of Pyro-Metamorphic action. Hydro-metamorphism is the alteration of a rock originally fused by the action of the water at a high temperature, but not sufficiently high to melt it, and pyro-metamorphism is the change undergone by rocks originally stratified, but subsequently acted on by heat, so as to be transformed into what are commonly known as metamorphic rocks. In the infancy of geology, granite was supposed to be the foundation, and consequently the oldest of all rocks; but it is of all ages, from the time of the original cooling of the earth's crust down to that of the eruption of Mount Pelée. Granite may be intrusive or metamorphic. For dressed work intrusive granites is preferred to that of metamorphic origin, as there are lines in the former, recognisable by a trained eye, along which the stone readily splits, and which lines or "grain" are not found in the metamorphosed rock. In this county a coarse kind of granite, which weathers badly, is found around Hacketstown and near Tullow; the good building stones are quarried along the western boundary near Murney and Bagenalstown, where surface blocks are also found which afford good working and lasting stone. In Carlow town granite has been used extensively for walling and dressings, including in the latter moulded work, the surface being finely punched or chiselled; many of the blocks are free working, and others are hard and refractory, so that a careful selection is necessary to secure good weather stones which can be easily worked. There is so little demand for building-stone at present, owing to the rapid decrease in the population, that two quarries only are worked for granite, and they afford employment for not more than four men. One quarry is at Boherduff, and the other at Graigue-na-Spidogue. The Graigue granite is a whitish grey, rather coarse-grained felspathic stone; it may be seen in the Bruen monument, and in the new church at Carlow. Window sills, mullions, quoins, and stone for every kind of building work may be obtained in these quarries, the prices being in proportion to the sizes ordered. Window sills 12in. by 4in. and from 2ft. 6in. up to 4ft. long are 4d. per lineal foot, quoins from 18in. to 2ft. long, 12in. high, and 12in. head, are about 6d. each, quarried in the rough and not including carriage. Large stones are expensive. For instance, landings about 5ft. square and 7in. thick cost in the quarry £3, many such stones were sent to the Curragh Camp. There are no modern appliances in the quarry for dealing with large stones: the nearest railway station is Carlow, which is five good Irish miles from the workings. Mr. J. Scully and his brothers are the quarrymen and owners, the property having been "in the family" for many years, so that anything they do not know about the working of Leinster granite for building purposes is not worth knowing. The Borris railway station is built with a white granite quarried in the locality. The cream-coloured granite of Lough, a fine, compact, curiously-spotted stone, was used in the window and door jambs and arches of Carlow Church and the new entrance to Oak Park. The same quarry often yields different granites. For instance, one at Tullowpheline furnishes a hard stone, quartz being the predominant mineral, and another stone in which felspar predominates; hence it is much easier to work. A quarry at Whitewalls furnished much of the granite used in Carlow; but these quarries are now closed, and the trade with Dublin, which was at one time very extensive, has completely ceased. Of fifty-six quarries shown on the Ordnance Maps, only six are now in work. Formerly erratic granite blocks found scattered over the granite main mass, as well as over the adjoining stratified rocks, were much more numerous than they are at present, for these stones were sought largely by builders to make door and window sills, pillars, field rollers, and gate posts. Kinahan remarks of these stones that the lengths of the scantlings supplied by them, and their strength over long bearings with small transverse dimensions, were remarkable; indeed, the best building stones were generally obtained from these erratic blocks. On the whole, it may be said that Carlow granite is friable, or coarse, and that the best quarried stone has always been obtained from quarries near Bagenalstown. Some fairly good granite can be obtained at Palatine,

on the Wicklow boundary. This stone, though coarse-grained, is regularly jointed. A granite quarried at Ballyloo is also regularly jointed, but as it has a tendency to break up into cuboidal fragments, it is not safe to use it in building. In Bagenalstown granite was commonly used for dressed work, much of it having been obtained from surface stones. In 1845 a large quarry was worked in Ballybegs, but it was not a success, for the stone was grey, felspathic, micaceous, and showed iron stains on the face of the work in weathering—a common fault with many grey stones. Granite of coarse grain, felspathic, with plates of black and grey mica and lumps of semi-crystalline quartz, is found at Kildranagh, a place about six miles north-east of Bagenalstown. Three miles north-east of the same town, at Newton, a grey granite was quarried; the stone was felspathic and micaceous with schorl, and contained lumps of pink felspar. Kilcurragh was another quarry near Bagenalstown. It yielded a loosely-aggregated, nearly white granite, the constituents being a white opaque felspar, whitish quartz, and grey mica. Elvans of fine grain are found in places along the margin of the granite, and in the schists there are other varieties more or less granitoid in character. The finer sort was much used by the old builders, for they are often found worked in with limestone to face the walls of ancient buildings; Wells Church, near Bagenalstown, and Ballymoon Castle afford examples of this kind of work. On examining the elvan in the church it is found to be much weathered; but in the castle most of the stones have a film of quartz on the weathered face, which has preserved them; but where this coating is wanting the stones have been disintegrated to the depth of an inch or more. Where protected from the weather, elvan makes remarkably fine work, and it is very durable.

CAVAN.

The rocks in this county are Keuper Marls; Permian Beds; Millstone Grit with coal seams; Yoredale Shales with ironstone overlying yellow sandstones; Carboniferous Limestones and Sandstones; Ordovician or Transition Rocks between Upper Cambrians and Lower Silurians. Cavan is built on Lower Carboniferous Limestones and Sandstone; Belturbet, Lower Carboniferous Limestone; Cootehill and Bailieborough, Ordovician beds. North-east of King's Court, at Derrynasrobo, there is a bed of gypsum in the Permian rocks, but it is not worked for building or any other purpose. The Millstone Grit was at one time worked into millstones, and there are good building stones in the same rocks on the Cuilcagh and Benbrack Hills, but they are "out of the way," and there are no ready means of transporting blocks to any market that might be found for them. The only good limestones in the county is that quarried at Crossragh on the north side of Lough Sheelin; there are several small quarries near Cavan, but the stone is not liked for dressed work. Crom Castle was built with a fine crystalline dark grey limestone from Belturbet; it works fairly well, but it splinters. The stone is found in thick and thin beds, which may be selected for the work required—a circumstance which always effects a great saving in labour. There was a good limestone quarry at Mount Nugent, but this and other quarries near were closed, as building stone is more easily obtained from the adjoining county of Meath. Yellowish grey sandstones belonging to the Lower Carboniferous rocks have been worked at Latt and Ballyconnell, near Cavan. Though they are very silicious, they work freely and are durable. These sandstones have been used extensively in Cavan; they were also used in Cullen College, built in 1871. The Ordovician rocks, which occupy a considerable area in this county, are generally slaty; they make good common walling, and are extensively used for this purpose at Bailieborough, Ballyjamesduff, Cootehill, Virginia, and other towns, sandstone or limestone being used for quoins and other dressed work. In the south-west of the town of Cavan there is a small area of fine-grained grey-and-pink granite; but it is not suitable for building, as it is much broken up by irregular jointing. The Cavan granite was introduced after the deposition of the Ordovician rocks, and before the Carboniferous Limestone was formed: hence it is really Silurian; associated with it are numerous dykes of whinstone and felstone, which cut through the bedded Silurian rocks. For dressed work limestone is used exclusively through the county. The Ballyconnell

stone was used in Ballyconnell bridge, lock, and lock-house, and extensively in works for the drainage company; it is a bluish-grey, hard, calpy limestone. Belturbet barracks were built with Clowinny stone; Blackwater bridge and several other bridges were built with stone quarried at Doon; Drumellis, Keady, and Killycrin furnished stone for the Cavan court-house, infirmary, and union workhouse. There are no less than 748 quarries shown in the Ordnance maps of this county, and there are now only two in work, and they give employment to three men.

DESIGNING IRONWORK.*

THIS little work on rolled steel joists, &c., forms Part IV. of the second series of these manuals, the previous parts being devoted to steel box girders, built-up stanchions, and cisterns and tanks. The present part contains historical data on rolled steel joists, compound girders, concrete and fire-resisting materials, and is accompanied by calculations and working drawings for a fire-proof floor. The author, Mr. Henry Adams, M.Inst.C.E., F.S.I., &c., is professor of engineering at the City of London College. Some interesting data are furnished. According to A.D. Dawnay, rolled iron joists were first made in 1849 by the Providence Works in Belgium; in 1850 the invention was introduced into France. In 1851 Fox and Barrett began to substitute rolled iron joists for cast-iron girders, which up to that time had been used in this country. Several years later, in 1865, the profession began to take the rolled joist up. The other main systems for floors and reinforced concrete are noticed. Data on the relative strength of wrought iron and mild steel are given. Measures Bros. show by a table the comparative strength of steel and iron joists of the same sectional dimensions. The ratio between the two is as 8 to 5, but the estimate varies according to other authorities. The specification tests for mild steel are of value. The formula for strength of rolled joists supported at ends when the span does not exceed 20 times the depth is $W = C \frac{a d^3}{L}$, when W = breaking weight in centre in tons of web, a = net area in square inches of one flange + $\frac{1}{2}$ in., d = depth in inches, L = length of span in feet, C = constant = 7 for rolled iron joists, 6 for compound girders with equal flanges, 10 = for rolled steel joists. For rolled joists examples are given. The author enters into the method of finding the moment of inertia, bending moment, shear stress diagrams, and the instruction, and worked out examples for a fireproof floor for public hall, accompanied by detail drawings, will be found of much value to the student. The book is packed with useful data and formula, and particulars of fire-resisting materials, plastering, partitions, fire-resisting window glass, fireproof floors, &c. The price of this little work is 2s.

CORNICES OF STEEL AND TERRACOTTA.

THE Land Title Building, Philadelphia, of twenty-three stories, has many features of constructive interest, which are illustrated in a recent number of the *Engineering Record*. The columns, floor beams, girders, offset walls are described. We here confine attention to the cornice. The great lever arm and weight of the cornice develop a heavy bending moment, which has required special construction. "This is afforded by riveting to each side of the column a $\frac{3}{4}$ in. plate about 2½ ft. wide and 4½ ft. high. Along the upper edges are riveted a pair of 12in. channels, which form long metal cantilevers supporting the cornice; 12in. and 15in. channels, parallel to the wall, are web-connected to these cantilevers, and to the lower part of the jaw-plates, and to them are secured the suspension rods and anchor bolts for the terracotta blocks. 12in. and 8in. channels below the wall girders serve as lintels over the windows, and support the lower courses of terracotta in the cornice." A section of the construction is given, from which it appears the total projection of cornice is 6ft., and a depth of about 9ft. from the top fillet of cyma to bottom. The cantilevers and sections of terracotta blocks, which are hollow, are shown in position. It is nothing un-

* Designing Ironwork. Second Series. Part IV. Rolled Steel Joists, Compound Girders, Concrete, &c. By HENRY ADAMS, F.S.I., M.Inst.C.E., M.I.Mech.E., &c., Professor of Engineering, City of London College. London: 60, Queen Victoria-street, E.C.

A GRANOLITHIC CHIMNEY SHAFT.

usual now to find architectural projections and details of this kind constructed on a system of iron or steel framing with an ingenuity worthy of a better cause. Architecturally speaking, we may question altogether this method of constructing ornament. Did the inventors of the cornice ever dream that in the 20th century buildings would be erected of great height, crowned by cornices which exercised the engineering skill of the architect to carry? We can understand solid built cornices of stone, supported on a core of York stone, or even terracotta mouldings carried on an oversailing course of brick or stone; but to construct a cornice with projecting steel cantilevers, from which the lower members are carried by suspension-rods, is a questionable mode of making architecture, that reminds us of "stagey" contrivances. It is really "constructed decoration" with a vengeance.

A GRANOLITHIC CHIMNEY SHAFT.

WE give an illustration of construction which is somewhat of a novelty in London, where the Building Act requires all furnace chimney-shafts to be carried up throughout in brickwork, with a taper upwards of 2½ in. in 10 ft. in height. In this instance, however, Mr. P.

Stuart (of Stuart's Granolithic Stone Co., Mill-wall) wished to prove that his well-known artificial stone (granolithic) could be rapidly and economically used for stonework of a decorative character, and therefore obtained the London County Council's sanction for its employment in this tower-like design. It has just been completed at the company's premises at Glengall-road by Messrs. Stuart's own workmen, and owing to the repetition of the blocks, and the rapidity with which they are cast and set, only six weeks have been required for its erection on the previously-prepared foundation, and it has a very effective appearance. The architects are Messrs. Stock, Page, and Stock.

CHIPS.

Among the newly-elected mayors of boroughs are several well-known architects, including Mr. Walter Emden, L.C.C., past-president of the Society of Architects, at Westminster; Mr. Lewis H. Isaacs, F.R.I.B.A., re-elected for Kensington; Mr. Charles Lynam, F.R.I.B.A., F.S.I., chosen at Stoke-on-Trent; and Mr. Albert Edwin Sawday, F.R.I.B.A., at Leicester. At Ipswich, the new mayor is Mr. Fied Bennett, builder, the most recent addition to the aldermanic bench of that borough; at Wands-worth Mr. John William Lorden, builder and contractor, has been elected; and at Tynemouth the choice has fallen on Mr. John Phillip Spencer, civil engineer, and from 1870 till 1880 the borough surveyor of that town.

In rural districts in Northumberland and Durham the surveyors report that the cost of carriage of road materials by motor traction is little more than half that of horse carriage. In the case of the Darlington urban district the outlay on haulage has been reduced from £111 to £63 per annum as a result of the change.

A new Established Church for the village of Dalmaur was recently opened. The new church, which is situated at the west end of the village, is designed in a Free treatment of Perpendicular, and is built of white stone. The building has transepts, and a chancel with organ-chamber. Over the entrance vestibule is a gallery. The church has cost about £5,000, and is seated for 800 worshippers.

The engineer's report (issued as a Parliamentary paper) on the Peterhead Harbour of Refuge Works for the year ending March 31 states that the daily average number of men employed has been: Freemen, 173; convicts, 167. It was originally contemplated that 500 convicts would be available daily. The average number during the last eight years has been 196.

St. Andrew's Church, Alexandra Park, Muswell Hill, was consecrated the other day by the Bishop of London. The church, which stands in the midst of a fast-developing neighbourhood, cost £8,000, of which £4,000 has already been received. Seating accommodation is provided for 800.

Preliminary operations in regard to the intended electric tunnel between North and South Shields are about to be commenced. The architect for the promoters, Mr. Fred Rennoldson, has asked and been granted permission to carry out boring operations near the riverside at a point close to the South Shields Corporation Staiths.

The town council of Salford have resolved to apply to the Local Government Board for sanction to borrow £3,117 to cover the cost of the overhead equipment of the tramways in Middleton-road from the Manchester boundary at Cheetham-hill to the Middleton boundary.

Lincoln's Inn Chapel, which has hitherto been lighted by means of candles only (gas never having been introduced there), has now had the electric light installed. A carved oak inlaid panel, in harmony with the surrounding woodwork, has been placed on the wall at the back of the pulpit, and the old sounding-board, which was removed in 1859, has now been replaced over the pulpit.

The health department of Newcastle-on-Tyne Corporation have recommended the extension of the hospital at Walker by 75 additional beds, and a nurses' home to be erected adjoining the hospital. It is estimated that the cost will be about £50,000. Extensions are also being made at the smallpox and isolation hospital on the Moor at Newcastle, at an expenditure of about £3,000.

A stained-glass window was unveiled at the morning service in Crediton Parish Church on Monday. The window is in the east end of the south choir aisle. The subject is the Resurrection, treated in a 15th-Century manner. The whole is surrounded by canopy work.

To meet the needs of Roman Catholics in Leven, Methil, and Buckhaven district, a chapel-school has been erected at Crossroads. Mr. Tod, Wemyss Castle, prepared the plan of the building, which is Gothic in style. On Sunday the chapel was dedicated to St. Agatha by Archbishop Smith.

THE LATE MR. SILVANUS TREVAIL.

A PAINFUL sensation was created on Saturday as it became known that Mr. Silvanus Trevail, of Truro and Westminster, who has only just completed two years of service as President of the Society of Architects, had been found shot in a Penzance morning up train on its arrival at Bodmin-road. At the inquest this week a verdict was returned of "Temporary insanity." The funeral took place at Luxulyan Church on Tuesday, and was very numerous attended.

Mr. Silvanus Trevail, F.R.I.B.A., J.P., was born at Luxulyan in 1851. After passing four university local examinations, two in honours, and taking the Associate of Arts degree of Oxford, he adopted architecture as a profession, and soon showed a good grasp of practical requirements. He first came into prominence as the architect of numerous board schools erected soon after the passing of the Education Act of 1870. About twenty-four years ago he opened business in Truro. In Truro he came into prominence shortly after taking up residence in the city by gratuitously designing and superintending the erection of a series of triumphal arches and other decorations in honour of the visit of the then Prince of Wales in 1880 to lay the foundation-stone of the cathedral. In 1886 he entered the city council as one of the representatives of the Eastern Ward. On the formation of the Cornwall County Council fifteen years ago he offered his services to the electors of the Eastern Ward, and was elected without opposition. Membership of the governing bodies of the county and of Truro brought him into touch with all county and local movements, and his astounding energy was drawn upon in a variety of ways, but still he found time to carry on and develop a large practice which in itself would have proved sufficient for the strength of most men.

Previous to entering the County Council, Mr. Trevail studied local government closely both at home and abroad, and his knowledge of the subject was esteemed so highly that he was requested to be one of the deputation to the Right Hon. C. T. Ritchie, then President of the Local Government Board, to represent certain county requirements whilst the Local Government Act of 1888 was still under consideration by Parliament. The proposals he helped to put forward on that occasion became part of the measure.

As a member of Truro City Council Mr. Trevail insistently advocated financial and sanitary reform. In 1894-5 he was elected mayor of the city.

A few years ago Mr. Trevail was appointed architect of extensions at the County Asylum at Bodmin, and that necessitated his retirement from the County Council. But he continued a member of the City Council up to the time of his death, and attended a recent meeting, though during the past twelve months he had not shown anything like his wonted interest in the City Council affairs. The building operations at the County Asylum were going on under his direction, and of the work—which is estimated to cost about £100,000—only about £30,000 has been completed.

Though his practice as an architect was a wide and varied one, Mr. Trevail will be chiefly remembered by his board schools, free libraries, and technical schools, and the huge hotels along the coast line. But he also carried out in his native county and elsewhere many banks, churches, chapels, schools, mansions, and hospitals. Among his executed designs are:—The Devon and Cornwall Banks at Truro, Falmouth, and Newquay; the Cornish Banks at Helston, St. Columb, and Newquay; the Post-office at Truro; the large blocks of board schools at Fowey, Mervagissey, St. Ives, Padstow, and Oxford-street, Plymouth; the public libraries built for Mr. Passmore Edwards at Truro, Hayle, Camborne, Bodmin, and Launceston; the Passmore Edwards Library and Hospital at East Ham, Essex; public library and technical schools for Newton Abbot, Devon; and in Truro the block of buildings known as the Central Technical School for Cornwall, a perspective view of which found a place on the line in the Royal Academy Exhibition of 1898. In hotels, Mr. Trevail's best known works are the Pendennis, at Falmouth; the Carbis Bay, St. Ives; the Housel Bay, at the Lizard; the Atlantic and Headland Hotels, at Newquay; and the King Arthur's Castle Hotel, at Tintagel. The residence of Mr. Edward Hain, M.P., Treloyan, St. Ives, is one of Mr. Trevail's works, and he also planned the churches of Nappan

and Upton Cross. The Royal Institute of British Architects selected in 1878 works by Mr. Trevail to represent British architecture in the Paris Exhibition of that year, and for the Sydney and Melbourne Exhibitions of the two following years, and these works earned for him international medals and diplomas. In 1885 he joined the Society of Architects, and subsequently was elected a member of the Council. He was unanimously elected a vice-president in 1896, and after filling that office for four years in succession, was unanimously chosen president of the Society for 1901-2, and re-elected for 1902-3. Only about a fortnight ago he was succeeded in the presidency by Mr. W. W. Thomas, of Liverpool. He threw himself into the work of the Society with characteristic zeal, warmly supporting the movements for the registration of architects, and the amendment of the laws of ancient lights, while he lost no opportunity of urging the importance of widening the roadways, and setting a higher ideal in the architecture of London streets. During his two years of office the annual dinners of the Society were organised on a much larger scale than had previously been attempted, and Mr. Trevail invited a large number of influential and distinguished guests from among his friends and clients; the toast lists on each occasion were swelled to abnormal proportions, and he proved an autocrat in his demands for brevity in speeches and responses. Some ten years ago Mr. Trevail was elected a Fellow of the Royal Institute of British Architects, and at the annual meeting of that body in May last strenuously supported the principle of Architectural Registration. As a result he was nominated for a seat on the Council, but was defeated at the poll. For some years Mr. Trevail was the strenuous advocate for "the second line of railway into West Cornwall," doing all in his power to get the lines of the London and South Western Railway extended to the west of the Delectable Duchy. In the pursuit of this he in 1894 led a movement which procured the rejection by the House of Commons of what he described as a Bill destined to prevent the London and South Western Railway coming further west, although the Bill had passed the Committee stage, and was upon its third reading. For this and other services to the county he was the recipient at the hands of the Lord Lieutenant, the Earl of Mount Edgecombe, of a service of plate valued at 500 guineas, and subscribed to by upwards of four hundred persons in the county. Notwithstanding the many calls upon his time, Mr. Trevail travelled a good deal on the continents of Europe and America. He never married.

OBITUARY.

The death occurred on Friday at his residence, Cavendish-road, Birkenhead Park, of Mr. JAMES RHIND, a well-known architect, practising in Dale-street, Liverpool, whose illness had only been of six weeks' duration. Mr. Rhind went to Liverpool about 30 years ago, and before commencing business on his own account was in the office of Messrs. A. and W. Audsley, in that city. He was in his sixtieth year.

His death has occurred of Mr. EDWIN POVER, borough surveyor of Faversham. The deceased gentleman had held the appointment for about thirteen years. During his tenure of the post the corporation had undertaken several important works, including new sewerage, the laying out of a borough cemetery, and several street widenings, under the surveyor's superintendence. Mr. Pover held several other public appointments, and in addition had a considerable private practice. He was sixty years of age, and was a native of Faversham.

On Thursday in last week, at his residence, North High-street, Musselburgh, there died ex-Bailie WILLIAM STREPPLES, the senior representative of a firm of house painters and decorators, established for generations in the town. From 1833 to 1897 he was a member of Musselburgh Town Council, and successively served as councillor, police treasurer, town treasurer, and bailie. In 1896 he missed being provost of the burgh by a single vote. He had a connection with the volunteer movement of fifteen years' duration. In connection with numerous local societies he was a prominent official. Since he retired from the town council six years ago he had been in indifferent health. He was in his sixty-fourth year, a widower, and leaves a grown-up family.

PROFESSOR ROBERT H. THURSTON, the head of the Sibley College of Engineering at Cornell

University, died there very suddenly last week, on his 64th birthday. Professor Thurston was known through his books on the materials of engineering. He was a native of Providence, Rhode Island, and a graduate of Brown University. He served with distinction in the engineering corps of the army during the Civil War, and at the close of the war was appointed Professor in the Naval Academy. Shortly afterwards he was offered the charge of the engineering department of Stevens Institute, in Hoboken. In 1885, on the organisation of the Sibley College of Engineering, he was invited to become its head, and had remained there ever since.

CHIPS.

Upon the death, on Sunday, at the great age of 93 years, of Sir Charles Nicholson, M.P., first baronet, of Sydney, N.S.W., and of Totteridge, Herts., his son, Mr. Charles Archibald Nicholson, architect, succeeds to the title. The late Sir Charles was a member of the first Legislative Assembly of New South Wales, and three times held the office of Speaker of that Chamber. He was knighted in 1852, and his baronetcy dates from 1859. The foundation of the great University of Sydney, of which he was for many years Chancellor, was the work with which his name has been specially connected.

The approaching tercentenary of the birth of Rev. Robert Bathe, ejected Vicar of Rochdale, and founder of the congregation which now worships at Blackwater Street Unitarian Church in that town, is to be commemorated by a memorial marble tablet to be executed by Messrs. Harry Hems and Sons, of Exeter.

In Okehampton parish church on Sunday a carved oak screen, at the tower end, was dedicated by Canon Flint. The Rev. Medley Fulford, late A.R.I.B.A., prepared the design gratuitously.

At Kettering new refuse destructor works are in course of erection in Rockingham-road for the urban district council. The chimney in connection with the works has now been carried to its full height of 152ft.

The restoration of Polebrooke Church is in progress at a cost of £1,400. The chief work is the repair of the nave roof.

On Sunday, the vicar of Chorlton, Staffs, dedicated a new oak reredos and stained-glass window. The reredos (the work of Mr. R. J. Epley, of Eccleshall) and the window (by Messrs. Burlison and Grylls, of London) have been presented to the church by the vicar and his sister.

Mr. H. Ross Hooper, M.A., inspector of the Local Government Board, held an inquiry in the Weston-super-Mare town-hall on Wednesday week with reference to an application by the Weston-super-Mare Urban District Council for sanction to borrow £2,860 to repair storm damages to the Knightstone undertaking and the Marine Parade.

The Cross Keys Bridge, at Sutton, which carries the main road connecting Lincolnshire and Norfolk over the River Nene, was on Wednesday week declared free from tolls. The bridge, which belongs to the Midland and Great Northern Railways Joint Committee, was erected in 1894-97, at a cost of £80,000, and is a swing bridge, worked by hydraulic power, built on the cantilever principle. The freeing has cost £7,000.

At the Guildhall, Plymouth, on Tuesday next, the 17th inst., Messrs. E. Pearce Burd and H. Percy Boulnois, M.Inst.C.E., Local Government Board inspectors, will hold an inquiry into the application of the Plymouth Corporation for sanction to borrow sums amounting to £248,252, in respect to capital expenditure incurred for purposes of electric lighting, sewerage, street improvement, parks, labouring-class dwellings, and other works, £3,200 for repaving Sutton-road, and £6,700 for purposes of electric lighting.

At the parish church, Weston-super-Mare, on Sunday, the rector dedicated a stained-glass window which has been placed in the north aisle. The subject of the window is Christ and his Disciples, with children in the foreground.

The ceremony took place in Danfermline Abbey on Saturday afternoon of unveiling a memorial of non-commissioned officers and men from the city who fell in action or died during the South African campaign. The memorial takes the form of a moulded Norman arch, resting on columns, with moulded base and carved capitals. In the centre of this is placed a massive tablet of Sicilian marble on a base of the same material. In front of the base and carved out of the same block are representations of the feather bonnets of the Highland regiments, also the claymore and belts, and on the top of these is placed a wreath of laurel. The memorial, which is 11ft. 6in. in height, has been executed by Messrs. Stewart, MacGlashan, and Son, Edinburgh.

Our Illustrations.

THE INDEMNITY MUTUAL MARINE INSURANCE COMPANY NEW OFFICES, OLD BROAD STREET, E.C.

This design, by Mr. Arthur C. Blomfield, M.A., shows an important corner block of buildings in course of erection at the corner of Threadneedle-street, with a frontage in Old Broad-street. The walls as shown were intended to be entirely in stone ashlar. The work is being carried out by Mr. Howard Chatfield Clarke, architect, this plan having been submitted in a limited competition.

DESIGN FOR A STAINED GLASS WINDOW: NATIONAL SILVER MEDAL DRAWING.

The legend of St. Nicholas, from which the subject for this stained-glass cartoon was taken, has this paragraph:—"During a dreadful famine in his country, St. Nicholas went about from town to town visiting and consoling his flock, and upon one occasion he took up his abode with a man who was accustomed during the scarcity to steal little children, and serve up their salted remains to his guests. He set such a dish before St. Nicholas, who at once perceived the crime, and, charging his host with it, went to the tub where the mutilated remains of the children were kept in brine, and, by making the sign of the cross over them, restored them to life." In the cartoon St. Nicholas is represented with the children restored; while the innkeeper is looking through the grating to the cellar, fascinated by curiosity, which for the moment overcomes his anger and terror at the saint's discovery. Miss Florence Camm is the designer of this window, and her cartoon reproduced to-day was one of a set for which a National Silver Medal was awarded this past summer.

UNITED METHODIST FREE CHURCH, SNEINTON, NOTTINGHAM.

This building will stand on a triangular site at the junction of Sneinton Boulevard and Thurgarton-street, Sneinton, in the City of Nottingham, and is planned to accommodate 550 persons—328 on the ground floor and 222 in the galleries. Externally the building is of local pressed bricks, with Derbyshire stone dressings, the roofs being covered with permanent green slates. The internal woodwork is of pitch-pine stained and varnished. The architect is Mr. W. H. Higginbottom, of Nottingham, whose design was selected in competition.

CHILDREN'S CONVALESCENT HOME, ST. ANNE'S ON SEA.

This home is for ten boys and ten girls, and with provision for further enlargement of five beds for each sex. It is to be fitted up on the latest principles. The materials are brick, with

stone dressings, red tile roof. The whole of the cost will be borne by Sir John O. S. Thursby, who is endowing it to be free of expense for always. The architect is Mr. Thomas Muirhead, of Manchester.

LEEDS PUBLIC LIBRARY AND BATHS: SECOND PRIZE DESIGN.

This drawing was exhibited at the Royal Academy this year by Mr. Percy Robinson, who won the second prize in the competition at Leeds a short time ago. We illustrated the selected design from last year's Royal Academy drawing in the BUILDING NEWS for May 9, 1902. Mr. H. Ascoug Chapman, A.R.I.B.A., being the architect.

SELBY ABBEY.

THE illustration of Selby Abbey is from a sketch of the south aisle of the choir. The abbey was founded in 1069 by Benedict, the nave alone being of Norman architecture. The rest of the building is a remarkably fine example of the Early and Late periods of Decorated architecture. The choir, in particular, is noted for its beauty and wealth of detail, and among other portions may be mentioned the fine sedilia and altar screen, and the arcading around the aisles. The abbey was suppressed at the Reformation in 1540.

DIEPPE CASTLE.

DIEPPE CASTLE occupies a picturesque position to the west of the town on the side of the hill. It was erected in 1435, and is a good example of a mediæval fortress with its machicolations and deep fosse around one side. It was besieged several times by the English, and was taken by them in the year 1694, after a strenuous resistance. It is now used as an infantry barracks and the interior is only visible by special permit.

APPLETREETWICK.

THE picturesque old building at Appletreewick in Wharfedale, shown in sketch, was formerly a chapel of ease used by the monks of Bolton Priory, which is about six miles distant. It has long been in a state of decay, and is now used as an outhouse. The adjoining building is called Low Hall, and is used as a day school. These two sketches are by Mr. Edward L. Gaunt.

The parish church of Fotheringay is about to be restored from plans by Mr. Temple Moore. The entire scheme is estimated to cost £7,000; but the section now to be undertaken will involve an outlay of about £1,600.

A stained-glass memorial window is being placed in the parish church of Penkridge. The subject of the window, which has eight panels, is "The Parable of the Sower," and it is the work of Mr. J. A. Dix, of Berners-street, London.

Sir Henry Hibbert, chairman of the Lancashire County Education Committee, opened a new "provided" school at Hazlehurst, Ramsbottom, on Saturday. The school has been erected, at a cost of about £7,000, to accommodate 368 scholars.

The portal-stone of the new Benson Hall in connection with the United Methodist Free Church at Whitley Bay was laid on Friday. Messrs. Mould and Tasker are the architects, and Mr. A. W. Stayer the contractor. The U.M.F. church itself, it will be remembered, was destroyed by fire a few weeks ago, and will also be rebuilt.

The will of Mr. Deputy John Greenwood, builder, of 10, Arthur-street West, and Highfield, Catford, has been proved, the value of the estate being £114,046 9s. 2d. The testator nominates his son, John Francis, to be the chairman of the directors of Greenwood and Co., Limited, and gives to Mr. W. G. Sheldon, Mr. James Hayes, Mr. Philip Henry Wyon, Mr. Josiah W. Stone, Mr. Percival Spencer, Mr. Stewart Greenwood, Mr. Sidney Hammond, Mr. Matthew Smith, Mr. Thomas Black, &c., the beneficial interests in various management shares during such times as they remain in the service of the company.

Under the auspices of the Institute of Builders a lecture on "A Comparison of English and American Methods in the Erection of Buildings" will be given by Mr. Charles Heathcote, F.R.I.B.A., of Manchester, at the Society of Arts' Hall, John-street, Adelphi, on Tuesday, Dec. 1.

At a mass meeting of the Penrhyn quarrymen at Bethesda on Saturday night, it was resolved to declare the strike ended. The figures were:—For discontinuing, 192; for continuing the struggle, 161. The men returned to work in the quarries on Monday, and thus the struggle is finally ended, after being stubbornly maintained for over three years.

COMPETITIONS.

BLACKPOOL.—The Fylde Water Board recently invited competitive designs for new offices to be erected at the corner of Sefton-street and Dixon-street, Blackpool, and on Wednesday week they met and adjudicated upon those submitted. The competition was limited to architects having offices within the Fylde Water Board area, and fifteen designs were sent in. After consideration the first prize was awarded the plans forwarded by Messrs. H. and W. Wade, 27, Birley-street, Blackpool, and St. Annes, under the motto of "Fair Trade." The total cost is estimated at £7,500, and the entrance is so arranged that it will be opposite Church-street, so that the clock-tower which will adorn the front will be seen from Church-street along Temple-street. It will be a three-story building, with a basement, and built of brick and yellow-stone facings. The accommodation will include—on the ground-floor, chief and assistant collectors', engineer's, drawing, and outside manager's offices, and show-room; on the first floor there is the board-room to the front, with an ante-room, offices for the clerk, superintendent and accountant, and accountant's clerk's, together with the telephone and typewriting rooms.

MEMORIAL WINDOW FOR DUNFERMLINE ABBEY.

—Sir Rowand Anderson, Edinburgh, who was appointed adjudicator on the eighteen designs sent in for competition for the McLaren memorial window to be placed in Dunfermline Abbey Church at the back of the pulpit, has made his award as follows:—(1) Messrs. Ballantyne and Gardner, Edinburgh; (2) Messrs. Stephen Adam and Son, Glasgow; (3) Messrs. Heaton, Butler, and Bayne, London; (4) Mr. C. R. J. Evans, London. The design of Messrs. Ballantyne and Gardner, which will be adopted by the trustees, includes two pictures. In the upper section is shown the empty tomb, illustrating the angelic message, "He is not here, He is risen." In the lower is a representation of the Lord's Supper.

CHIPS.

The Grand Duke Michael unveiled at Newcastle-under-Lyme, on Friday, a statue of Queen Victoria, a Coronation gift to the town by Sir Alfred Haslam, M.P., in his dual capacity as Parliamentary representative and mayor of the borough. The statue in bronze is a replica of the well-known one by the late Mr. Birch erected on the Victoria Embankment near Blackfriars Bridge. It is erected on a pedestal of granite 9ft. high, and has been put up in a prominent position on which six thoroughfares converge.

The urban district council of Skipton have decided to promote a Bill in Parliament next session for an Act authorising the utilisation of the Embasy stream and the construction of a reservoir near Embasy Moor, and with power to supply with water not only the township of Skipton, but the townships of Embasy-with-Eastby, Steeton-with-Thorlby, and Carleton. The engineer is Mr. G. H. Hill, of Manchester.

The Light Railway Commissioners have submitted to the Board of Trade for confirmation an order made by them for the construction of light railways in the county of Essex, from Southend by way of Rochford, Creeksea, Burnham, Southminster, Asheldham, Dengie, Tillingham, Bradwell-juxta-Mare, and West Mersea, to Colchester, including ferries and piers or jetties at Creeksea, Bradwell, and West Mersea.

Memorial stones have been laid of a new Wesleyan church now in course of erection at the corner of Harnett-road and Wimpole-lane, Colchester. The building, which is Gothic in style and will have a spire, is of red brick and stone. Messrs. Dobson and Son are the builders, and Messrs. Goodey and Cressall are the architects. It will provide seats for 500 persons, whilst the schoolroom will accommodate 250. The estimated cost of both buildings is £5,000.

The Hon. Mrs. Meynell Ingram has contributed £30,000 towards the cost of a new church and vicarage at Holbeck, Leeds. The Church Extension Society of Leeds have promised £3,000. Lord Halifax on Saturday laid the corner-stone of the building, which is to be erected from the plans of Mr. G. F. Bodley, R.A., and is to be dedicated to St. Edward the King. It will seat 750 persons. Mr. Bodley is also the architect of the adjoining church school; while Mr. H. Chorley, of Leeds, is the architect of the vicarage.

The London Water Arbitration Court on Saturday heard further evidence from accountants and others as to the proper method of estimating the revenue of the East London Water Company, and the case as regards this company was completed. The Court adjourned till Monday next.

Engineering Notes.

BERWICK.—At the last meeting of the town council the condition of Berwick Old Bridge was discussed. The borough surveyor reported that he had discovered, while a new footpath was being laid, a cavity behind the spandrel of one of the arches, causing the spandrel to bulge outwards. The same external conditions were visible at other arches. Mr. James Stevenson, architect, who had been called in to examine the bridge, reported that the parapet walls on the west side, which were 12in. thick, had no proper footings, these having been broken or worn away to a thickness of only about 3in., and part of the parapet walls were in a dangerous condition, and might give way at any time with serious consequences. The main structure of the bridge, piers, and arches, however, was safe. He recommended the taking down of the parapet walls and their rebuilding as at present after the footings had been put right. A long discussion ensued, it being suggested that the present stone parapet should be replaced by a lighter iron trellis. Mr. Stevenson said by his scheme the old character of the bridge would be preserved, and he thought anyone with an understanding of that relic of the past, and the vandalism that suggestion would mean, would do what they could to preserve the character of the bridge. It was finally resolved that the services of an efficient bridge engineer be called in to examine the bridge, the works committee being empowered to carry out any repairs suggested.

SOUTHAMPTON.—The work of providing increased quay and dry-docking accommodation at Southampton Docks is in active progress for the London and South-Western Railway Company. The land on which the new graving-dock is being built, with its pump-house and all the other appurtenances, was originally part of an extensive mudbank on the shore of the Test, which was covered by every high tide. To reclaim the land a chalk bank was tipped round it, the chalk being taken from the company's cutting at Micheldever. The surface of the chalk bank was then pitched with stone, and measures were taken to render it watertight, and as soon as it was sufficiently sealed to keep the water out, a centrifugal pump was installed in the inclosure to dry the reclaimed land. When the land was dry, excavations by hand gangs, steam crane, and steam-navvy commenced, the earth being utilised towards the re-filling and reclamation of other mudlands on the Dock Estate. The permanent dock walls are 22½ ft. thick at the base, diminishing to 3 ft. at the coping level, while the floor is 16 ft. thick at the middle of the dock. The floor is reached by eight flights of steps, and the dock is provided with a travelling electric crane capable of lifting 50 tons at 80 ft. radius. The entrance gates, which are being constructed by Messrs. Head, Wrightson, and Co., of Teesdale, will have a span of 90 ft., and are constructed of steel. The pump-house will contain two centrifugal pumps capable of emptying 85,000 tons of water in 2½ hours. Alongside the pump-house is a boiler-house. The dock will be 860 ft. long (and can be lengthened if necessary), 90 ft. wide at the entrance, and 120 ft. wide at the level of the coping. It will give a total depth of 29 ft. 6 in. neap tides, to 33 ft. spring tides at high water. The portion of the docks constructed in 1875 is also being extended and deepened from the present depth of 20 ft. to 30 ft. It has been decided to construct the platform of ferro-concrete on the Hennebique system. The work has been carried out in three sections, the first of which was completed in August, while good progress is being made with the second. Designs have been prepared, and the work commenced, for a new electric power station, from which will be supplied the current to electrically light the whole of the Docks. This is being erected on reclaimed land near the new graving dock. The engineer for the new work is Mr. W. R. Galbraith, M.Inst.C.E., and the resident engineer is Mr. F. E. Wentworth Shields, Assoc.M.Inst.C.E. The contractors for the work are Messrs. John Aird and Co., whose representative is Mr. J. W. Londrey.

WESTON-SUPER-MARE.—The commemorative pile of the new pier promoted by the Grand Pier Company at Weston-super-Mare was driven on Saturday. The new pier starts immediately opposite the end of Regent-street. The cost is estimated at £30,000. The total length will be

6,600 ft. by 45 ft. wide, increasing in width when the pavilion will be erected to 160 ft. The weight of cast-iron and steel work required is nearly 4,000 tons, and 600 screw piles will be used. The pavilion is to be of steel and wood, with four corner turrets and central dome, the dimensions being 150 ft. by 90 ft. wide. The main hall, 85 ft. by 70 ft., is arranged to seat 2,000 persons, with a stage 62 ft. by 23 ft. The entrance-hall is 42 ft. by 28 ft., and the ground floor refreshment-room is 33 ft. by 22 ft. An electric tramway will run the entire length of the pier. The pier itself is to be lighted by electric arc lamps. The landing-stage will accommodate two vessels at one time alongside, and at any state of the tide. The first portion of the pier and pavilion is to be opened in June, 1904.

PROFESSIONAL AND TRADE SOCIETIES.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—The annual business meeting of the Leeds and Yorkshire Architectural Society was held at the society's premises, Park-street, Leeds, on Monday, Mr. Butler Wilson, F.R.I.B.A., presiding. The chairman stated that the opening meeting of the new session would be held on the 19th inst., when the lady friends of members would be welcomed. The hon. secretary, Mr. H. S. Chorley, presented the annual report, which stated that the aggregate membership of the society was 141, being made up of 36 honorary members, 61 members, and 44 associates, the total membership being an increase of four on the previous year. The report mentioned with satisfaction that the new school of architecture, established under the auspices of the society, though still in its infancy, was an accomplished fact, and a full course of instruction was provided for the associates of the society in all subjects required for the preliminary and intermediate R.I.B.A. examinations. The competition among the associates for the prizes offered by the society was keener and more enthusiastic than in the intermediate previous years, and the work submitted was judged to be of a better and more even quality than had been the case in the three previous years. The silver medal and prize of five guineas given by the president for the best measured drawing of any ecclesiastical or domestic building erected anterior to 1800 A.D. was awarded to Mr. Martin Shaw Briggs, for measured drawings of Swinsty Hall, Yorkshire. A special prize of three guineas was awarded to Mr. P. A. Horrocks, for measured drawings of Hall's the Wood, Bolton; the prize of three guineas for the best design of an entrance-lodge and gateway, to Mr. Ralph Thorp; the prize of two guineas for the best essay on "Modern Street Facades in Leeds" to Mr. Martin Shaw Briggs; and the sketching prize of three guineas to Mr. J. C. Procter. No further steps had been taken, it was reported, to create a chair of architecture at the Yorkshire College. Mention was made in the report of the council's active interest in the proposed laying-out of Victoria-square, and also in the improvement of City-square. In regard to the former, it is pointed out that the first essential is the enlargement of the square on its southern side, the present area being totally inadequate. In regard to City-square, the president formed one of a deputation from the Society to the improvements committee, and asked that a new frontage line at the south-west corner between Wellington-street and Quebec-street should be adopted, and also that the building to be erected on the vacant ground should harmonise, and as far as possible correspond in outline and skyline with the Standard Assurance buildings. It was satisfactory to record that these suggestions had been adopted. The council expressed their gratitude for the valuable collection of architectural works bequeathed to the Society by the late Mr. E. Birchall, and notified that steps were being taken to deposit the Society's library with the City Library authorities for better security and supervision. The report was adopted on the motion of Mr. G. F. Bowman, seconded by Mr. R. P. Oglesby. Mr. W. H. Thorp (hon. treasurer) read the statement of accounts, which showed a balance in hand at the end of the financial year of £95 5s. 2d., as compared with £96 8s. 1d. the previous year. The balance-sheet was adopted on the motion of Mr. H. Perkin.

THE ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.—A general meeting of the members of the Royal Institute of the Architects of Ireland was held at 20, Lincoln-place, on Thursday,

Nov. 6, at 4 o'clock p.m., Mr. G. C. Ashlin, President, in the chair. Also present, Messrs. J. Kelly Freeman, R. Caulfield Orpen, C. A. Owen, Joseph A. Geoghegan, J. Charles Wilmot, James H. Webb, J. Rawson Carroll, Edwin Bradbury, W. Kaye Parry, Geo. P. Sheridan, and W. M. Mitchell. The ballot papers for the election of Honorary Secretary and Honorary Treasurer were examined, and the President announced that Mr. R. Caulfield Orpen had been elected Honorary Secretary and Mr. Charles Ashworth Honorary Treasurer of the Institute for the ensuing three years. Mr. J. Rawson Carroll moved and Mr. William Mitchell seconded the following resolution, which was carried unanimously: "That the Institute at its general meeting take the opportunity of placing on record its hearty appreciation of the indefatigable energy and tactful skill which Mr. Kaye Parry has displayed in carrying out the duties of Honorary Secretary of the Royal Institute of the Architects of Ireland during his term of office." A cordial vote of thanks to the outgoing Honorary Treasurer, Mr. C. A. Owen, was moved by Mr. W. Kaye Parry, seconded by Mr. R. Caulfield Orpen, and carried unanimously.

CHIPS.

Among the Birthday honours announced on Monday is a knighthood for Mr. Charles Holroyd, Keeper of the Tate Gallery, and a well-known etcher and water-colour artist; Col. Dunlan A. Johnston, R.E., director-general of the Ordnance Survey, receives a Companionship of the Bath; and Mr. Louis Philippe Hébert, a Canadian artist and sculptor, receives a C.M.G. The Imperial Service Order is conferred on Mr. Cecil Wat Darby, engineer-in-chief for Public Works, New South Wales; and on Mr. David Ewart, chief architect to a Canadian Department of Public Works.

Hans Beham's famous fountain at Nuremberg, originally erected between 1385 and 1396, has just been undergoing restoration, and is now resplendent in gilding, red and blue paint. A great part of the work has been to obliterate the alterations made in 1587 and in 1821. The four lions at the angles have been removed, to be replaced by statues of the Four Evangelists.

The war memorial erected in Chester-le-Street cemetery by public subscription was unveiled on Friday by Lord Chesham. The monument is in the form of an obelisk standing 15 ft. 9 in. high, and is of Shap Fell granite throughout. On three of the four sides the name of some principal scene of action in the late war is cut in relief round the base of the pedestal. The fourth side contains the name South Africa.

The new All Saints' Church at Elland, near Leeds, was dedicated on Friday. The church has not yet assumed the dimensions of the original scheme, which was to cost £15,000. The building has been erected on a site given by Lord Savile, and consists of the eastern section of the church, including chancel, transept, morning chapel, and bays of nave. This portion seats 450 worshippers, has cost £11,500, and is Early English in style. The roof is waggon-vaulted.

The Great Western Railway Company have decided to erect at Westbury Station an engine-shed, giving accommodation for forty locomotives, to serve the new line from London to the West, on completion of the Castle Cary-Langport branch, which is now under construction.

A new school which has recently been erected by the London School Board in Kingsgate-road, Hampstead, at a cost of over £17,700, and which provides accommodation for 452 boys and girls, was opened on Monday.

The foundation-stone of a new church at Broadheath, in the parish of Hallow, near Worcester, was laid on Friday. The building has been designed by Mr. C. Ford Whitcombe, and is estimated to cost £3,050. Towards this sum £2,500 has already been raised. The church will consist of a nave, chancel, western tower, and an ambulatory on the south side, which will afford means for extension. Seating accommodation will be afforded for 210 people.

At a meeting of St. Annes-on-Sea Urban District Council it has been decided to adopt the Free Libraries Act. St. Annes, it was stated, has prospered more than any other town in the North of England, and at no distant date there will be a museum and a technical school. The council are promoting a competition among local architects for the best design for the Carnegie Library, the inclusive cost of which is not to exceed £3,500.

A memorial to the late Sir Frederick Perkins, J.P., was dedicated on Sunday at St. Peter's Church, Southampton. The memorial, which is the gift of Lady Perkins, consists of carved oak choir-stalls, executed by Messrs. Sinclair and Clements, of Oxford-circus, London.

Building Intelligence.

Bristol.—A branch police and fire-station is being erected for the Bristol Corporation at Horfield, on a piece of ground formerly used as a nursery at the corner of North-road and Somerville-road. The station will have a Classic front of Cattybrook bricks and freestone dressings. On the ground floor will be the inspector's office, and in the rear the charge room. The cell accommodation will be for one female and three males. Towards the corner are the fire-station and engine-house, and adjoining are a two-stall stable, a fodder store, and general store. Quarters are provided over the police and fire-station for one married and one single policeman. The buildings will be warmed by a low pressure hot-water system. The contract for building has been let to Messrs. R. Wilkins and Son, of Bristol, at £4,437.

Ranworth, Norfolk.—The nave of the parish church of St. Helen Ranworth, was reopened on Thursday in last week by the Bishop of Norwich, after having been closed for repair for about four years. A new roof has been erected over the nave, and the tower and walls made structurally sound, while the famous screen has been repaired. The old pulpit has been restored, and the ancient benches replaced with an oak block floor beneath them. Mr. J. T. Micklethwaite, F.S.A., was the architect, and Messrs. Cornish and Gaymer, of North Walsham, were the builders. The total outlay has been £3,100.

Embleton.—At the Northumberland village of Embleton, last week, the new club-rooms and village hall, erected as a memorial to the late Dr. Mandell Creighton, Bishop of London, were formally opened. The building is constructed of local basalt "whinstone," with Accrington red brick facings and rough-cast gables. The west portion of the structure provides for separate clubs for men and women, having billiard-room, reading-rooms, library, and four rooms upstairs for caretaker. On the east of the club rooms is the large hall, 65ft. by 27ft., with stage 15ft. by 27ft., under which is a store for tables and stage apparatus. The work has been carried out by Messrs. Elliot Bros., contractors, Preston, from the plans of Mr. J. Wightman Douglas, architect, Alnwick and Newcastle, whose designs were selected in competition.

Edgaston.—The new reredos which has been erected at a cost of over £700 in St. George's Church was recently dedicated. The reredos, which is of oak, and covers the whole of the east wall of the chancel below the window, is divided into five parts, the centre being higher than the sides. The top is 20ft. above the altar steps. There are a number of niches with canopies, and it is to be hoped that all will in due time be filled with figures. In the centre niche has been placed a carved figure of our Lord in the act of blessing. The side niches and canopies will contain figures of the four evangelists, two of which have already been given. The lower portion of the reredos is filled in with tracery in panels, while a moulding about a foot wide, decorated with shields and vine leaves, runs on the two sides and top of the centre portion. The reredos is the work of Mr. Bridgeman, of Lichfield, who has executed all the other carving in the church, and is from designs by Mr. J. A. Chatwin, architect, of Birmingham.

London County Council.—At Tuesday's meeting of this body, approval was given, after some discussion, to a report of the Fire Brigade Committee to purchase sites in Queen Victoria-street and Cannon-street, on which to erect a station in substitution of the present station in Watling-street, and also to build new fire stations at Knightsbridge and Shooter's Hill. The Main Drainage Committee recommended that the expenditure of £291,000 should be sanctioned in respect to the construction of a second section of the proposed new sewers between the Crossness outfall and the Plumstead railway station, and that the work should be carried out without the intervention of a contractor, and that the drawings, specifications, and estimate should be referred to the Works Committee for that purpose. After the rejection of an amendment to refer the matter back to the committee with a view of inviting tenders for the work, the recommendation was adopted. The Parks Committee reported that satisfactory progress is being made with the acquisition of the various properties required for the Hainault Forest scheme. Mr. E. North

Buxton had been actively employed on the work of reforesting the farmed land, the result of which would be very apparent by the time the land is thrown open for public use. It was agreed to lend the Westminster City Council £63,000 for the erection of working-class dwellings at Regency-street, to be repaid in sixty years.

Liverpool Cathedral.—At a meeting of the executive committee of the Liverpool Cathedral scheme, on Tuesday, Mr. George Bradbury (consulting surveyor) reported that the demolition of houses on St. James's Mount had been begun preparatory to the laying of the foundations of the cathedral. The committee decided to proceed, in the first instance, with the main fabric of the building, including the choir and the cross of the transepts. This part of the building will accommodate a congregation of 3,500, and the cost will approximate to £240,000. It was further announced that the superficial area to be occupied by the cathedral when completed will exceed that of any similar building in Great Britain. Since the meeting, Earl Derby, as chairman of the committee, has received a letter from Lord Knollys, intimating that the King recognises the importance of the work of building a cathedral for the diocese of Liverpool, and that it will afford his Majesty much pleasure to give every consideration to the request which had been made to him that he should lay the foundation-stone early next year.

Newcastle-on-Tyne.—A visit of inspection was paid on Friday to the new infirmary buildings in course of erection on the Leazes by the building committee and subscribers, who were conducted over the works by Mr. Henry Cockrell, the clerk of works. The new infirmary, which occupies a site of ten acres, given by the corporation, will provide accommodation for 420 patients, as compared with 270 in the existing institution. The buildings are on the pavilion system, designed by Mr. H. Percy Adams, of London, and Mr. W. Lister Newcombe, of Newcastle. All the pavilions and the other buildings are parallel, and they occupy almost every yard of the site, running close to the boundary-walls. The nurses' home faces the Jubilee gates at the Leazes Park. Immediately behind it is one short pavilion, and then behind that are two pavilions in one long block. Behind that comes the administrative block, facing the Spital Tongues-road, and at the rear of that are two short pavilions. Another block contains two pavilions, and, skirting the roadway, is the last long block, comprising out-patients' department, children's wards, and boiler house. The accessory buildings include mortuary, laundry, and lodges. A main corridor runs along the whole length of the building, giving access to each ward. The surgical wards are all placed on the ground floor, where the operating-theatres are, and the medical wards are on the upper floor, all the pavilions being of two stories, except that at the lower end of the slope, where three stories have been built. The nurses' home has been accelerated, and it will be ready for occupation in June next. It is of freestone and red brick, and contains 105 bedrooms, besides sitting-rooms and other apartments. The home will be joined to the pavilion behind it (No. 3) by a conservatory.

St. Bartholomew's Hospital.—The Governors of St. Bartholomew's Hospital, at a court held on Thursday in last week, finally decided to rebuild the hospital on its present site, with certain extensions. It was agreed that, in the general scheme of rebuilding, provision be made for additional operating theatres; new casualty and out-patient departments; new nurses' home; new quarters for the resident medical and surgical staff; an isolation block and other new ward blocks to supply the place of those to be demolished; new mortuary, post-mortem rooms, and pathological department; internal structural rearrangement of the east, west, and south wings of the hospital. The house committee, with power to add to their number, are requested to determine, after consultation with the medical staff, by which of the several plans submitted by the architects, subject to such modifications as from time to time appear desirable, provision for the foregoing purposes can best be secured.

Sandwich.—The new church of St. John the Evangelist was opened last week by the Bishop of Chester. Completed save for the erection of the spire on the tower, the church consists in plan of nave, north porch, chancel, organ-chamber, and vestry on the south side. The whole is built of mottled red sandstone from the Five Crosses quarries near

Frodsham. The interior is of chiselled stone; the roofs and ceiling and the chancel are executed in oak. The nave and chancel fittings are in brown ash; the organ-case and fittings in the sacristy are of oak, the former being carved, and the front is embellished with sculptured angels holding a deep scroll. The floor of the sacristy is of vari-coloured marbles, sedilia and credence being provided on the south side. The altar rails are of wrought iron capped with oak rail. The frontals of the altar and the dorsal are of needlework. The west window of three lights is filled with painted glass, the subjects being "Faith," "Hope," and "Charity." The east window, and also two windows in the west end, and one in the tower over the font, are filled with stained glass. The latter represents the baptism of our Lord by St. John. The church is heated by hot water, and the lighting is by acetylene gas. The exterior roof is covered by small Westmorland green slates, and on the north side of the chancel is a sculptured niche with the patron saint of the church, St. John the Evangelist. Messrs. Beckett and Co. were the contractors, and the masonry was by Mr. John Palmer, of Frodsham; the chancel and other fittings by Messrs. W. and F. Brown and Co., of Chester, and the organ-case by Mr. H. F. Thomas, the architect being Mr. Douglas, of Chester. The nave, porch, and vestry have been erected at the cost of the parishioners, and the chancel, with tower, by Mr. Douglas, who also gave the site on which the church is built.

CHIPS.

A bronze statue of the late Sir Titus Salt, Bart., was unveiled in Saltire Park on Friday. The statue has been erected in commemoration of the hundredth anniversary of the birth of the late baronet, and the fiftieth anniversary of the opening of Saltire Mills. Mr. F. Derwent Wood, of Chelsea, was intrusted with the commission for the statue, which is 9ft. 6in. in height, and stands upon a pedestal 12ft. high.

The chancel and two bays of the nave of the new church of St. Thomas, Bedford-Leigh, Lancs., were opened last week. It occupies the site of a previous church. The cost of the portion already built, exclusive of furnishing, has been about £7,300.

The Lancashire County Council on Thursday in last week, after considerable discussion, sanctioned an application for powers to secure property near the present offices at Preston with a view to the building on the site thus enlarged of new premises for the transaction of county business. The scheme, which will involve the expenditure of a sum of about £100,000, will be further considered before definite steps are taken.

On Thursday in last week a Local Government Board inquiry into the Sittingbourne Urban Council's request for sanction of a loan of £6,000 to purchase the Milton Council's interest in the water-works at Keycol Hill, was held at the town-hall, Sittingbourne, by Col. A. J. Hepper, R.E., Local Government Board inspector.

A portrait of the late Duke of Westminster was unveiled on Saturday in the town-hall, Chester. The picture is a reproduction by Mr. Hanson Walker, of London, of the portrait by Millais representing the late Duke in hunting costume.

The death occurred last week of the artist in stained glass, Mr. V. Ostrehan, who carried out many important works, including a window to the memory of Sir Thomas More erected by Mr. H. C. Richards, K.C., M.P., at St. Lawrence Jewry.

The Leeds City Council approved on Monday the purchase from Mr. W. Gervase Beckett of the model lodging-house at the junction of Dyer-street and Millgarth-street for £16,500. The property is required in connection with the Quarry Hill unhealthy area scheme.

The Hudson River Tunnel from Hoboken to Morton-street, Manhattan, has reached the pier-line with the northerly shield, and the remaining 800ft. under the island to the New York shaft will doubtless be completed early next year. The southerly tunnel is not so far advanced, and cannot be finished until 1905.

Messrs. Wm. Potts and Sons, church clock manufacturers, Leeds, and Newcastle-on-Tyne, have received instructions from the memorial clock committee to erect a Cambridge quarter-chime clock at the Killamash Parish Church, Derbyshire, before the close of the year. They have just completed a new clock with two dials at Netley Hall, Shrewsbury, for Colonel Hope Edwards, J.P., and are now erecting church clock at Newcastle-on-Tyne for the corporation—got in competition. All the above are from Lord Grimthorpe's plans, for whom Messrs. Potts have made clocks for over half a century.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., L., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

. Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—M. H. D.—N. P. W.—R. S. and Son.—J. G. S. E. (Bristol).—H. B. P.—L. A.

KALAMAZOO.—If we understand your question right, owner of fence may serve notice to No. 2 to observe his boundary. He had better do this before moving the fence. Instead of the sketch of fence you send, a plan would have been more useful.

"BUILDING NEWS" DESIGNING CLUB.

F. H. ROBINSON. (We do not think there ought to be any difficulty in getting the plans of Solicitor's House on the sheet to 1/16th scale; but if this really is the case, you can use 1/16th scale for the plans. The larger scale is desirable.)

Correspondence.

POLICE AND FIRE STATIONS, NEW WINDSOR.

To the Editor of the BUILDING NEWS.

SIR,—The Competition Reform Society Committee disapproves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reasons: No professional assessor; elevations only required. The Corporation reserve the right of erecting the building without further payment to the successful competitor than the premium of £25; premiums insufficient.

Architects are requested to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised.—I am, &c.,

HENRY A. SAUL, Hon. Sec.

10, Gray's Inn-square, London, W.C., Nov. 9.

UNSUITABLE MORTAR FOR METAL LATHING.

SIR,—Seeing how many patents there are for metal substitutes for lathing, it may be useful to your readers to have a note of an experience of mine in the use of one of these substitutes—namely, expanded metal. I was induced to use expanded metal, after a great deal of hesitation, on the lower surface of an iron and concrete floor, with the object of forming a key for a thick coating of ordinary lime-plaster, which was supposed to protect the floor from fire to a great extent. The expanded metal was entirely imbedded either in the cement-concrete or the plaster, and nowhere exposed to the air. After about eight years the ceilings are falling, the expanded metal having completely perished by rust. I am advised by an analytical chemist of great experience that this is due to the plasterer's mortar, which was composed of white lime and ground engine-clinkers—the ordinary materials here for "rough stuff." It is clearly necessary to be very cautious what the ingredients are of the mortar or plaster which is used with these metal lathings. I do not suggest that the expanded metal was any less suitable for its purpose than any of the other forms of these lathings.—I am, &c., E. W. M. CORRETT.

Castle-street, Cardiff, Nov. 5.

Intercommunication.

QUESTIONS.

[12022.]—**Worms in Furniture.**—Can any reader inform me how to destroy worms in furniture, and how to make it secure against further attacks?—CHAIRS.

REPLIES.

[12019.]—**Scarcement.**—You cannot claim more ground than that indicated by the figured dimensions, although your scarcements project beyond. In the absence of due provision in the feu charter the scarcements should not have projected beyond the boundary, and from the fact that they actually do, you have no claim to the ground they occupy.—D. FORBES SMITH, A.R.I.B.A., Kirkcaldy.

[12019.]—**Scarcement.**—If you write the Secretary, Surveyors' Institution, 12, Great George-street, Westminster, S.W., he would suggest good local man who could advise you.—REGENT'S PARK.

[12019.]—**Scarcement.**—The sizes given in the description of the piece of ground in the body of the Feu-charter, or—in the absence of such description—the figures on the plan, rule the whole matter, and apply to what is underground as well as above the surface. Anything outside the lines of boundary as laid down is an encroachment, whether it is by way of scarcement underground or by projecting rhomb above. Even the projection of a chimney cope or a window-sill over the boundary line can be objected to.—SCOT.

[12021.]—**Temporary Building.**—Landlord is likely to claim all put into his land, but, as I presume, not that resting thereon. Look out half a dozen names in Kelly's Directory of portable house builders. There are many special linings for inside of walls and ceilings, or outside for roofs, such as Uralite. A good insulating material is silicate cotton. There are also several roofing materials, felts, &c., in weekly building papers or in Kelly's worth inquiring about. Notice to local district surveyors, of course.—REGENT'S PARK.

The Bishop of St. Albans consecrated at Walthamstow, on Saturday, the Church of St. Barnabas, which has been built at the entire cost—some £20,000—of Mr. Richard Foster, of Chislehurst, Kent. The church is built of red brick, with stone relief work. It takes the place of a temporary iron structure.

Princess Christian of Schleswig-Holstein visited Limehouse on Saturday afternoon to lay the foundation-stone of the Limehouse Church Institute. The new institute is estimated to cost £7,000, towards which £5,722 is promised. The building will contain billiard-rooms, clubrooms, gymnasium, kitchen, a hall to accommodate 400 people, &c., with electric light throughout. The architect is Mr. W. H. White.

A statue of the Redeemer, about 17ft. in height, sent from Denmark, has been erected on the right side of the steps leading to the Royal Mausoleum, Frogmore, by order of Queen Alexandra, in memory of Queen Victoria, "the best of mothers-in-law."

A receiving order has been made in the case of William Henry Waterman, of Cullum-street, Fenchurch-street, E.C., architect.

LEGAL INTELLIGENCE.

HOLBORN AND STRAND IMPROVEMENTS.—EX-PARTE THE TRUSTEES OF ST. GILES' CHRISTIAN MISSION OF LITTLE WILD-STREET, LONDON.—In the Chancery Division on Saturday, before Mr. Justice Joyce, the petitioner asked the sanction of the Court to £3,865 being invested, and a sum not exceeding £7,000 laid out in erecting a chapel and buildings in substitution for the chapel taken by the County Council for the Holborn and Strand Improvements. The old chapel was leased to the Trustees in 1639 at a peppercorn rent, and compensation for taking it had been paid to the amount of £11,623 10s. The seventeen present Trustees agreed with the Council to purchase from them a contiguous site for £3,865 on which to erect new buildings, and the sanction of the Court was asked for dealing with this sum by investment, and for £7,000 to be expended on erecting a new chapel. (The new building will be erected at the corner of Great Wild-street and Wild-court, from plans by Messrs. Ernest Runtz and Co., and was illustrated by plan and perspective in our issue of April 17 last.) Mr. Justice Joyce granted the petition with liberty to apply as to the balance.

IS AN OPEN CHANNEL A SEWER?—WILKINSON V. THE LLANDAFF AND DINAS POWIS RURAL DISTRICT COUNCIL.—In the Court of Appeal, on Saturday, Lords Justices Williams, Romer, and Stirling gave judgment in the appeal by the defendants against a decision of Mr. Justice Phillimore's. The action was tried at the spring assizes at Cardiff in March last. The plaintiff claimed an injunction to restrain the defendants from permitting any foul or noxious matter to remain in a surface-drain at the side of Millbrook-road, in Dinas Powis, within the defendants' district. The plaintiff also claimed damages on the ground that foul matter in the channel had caused the illness of his child. The main question in the case was whether the channel was a "sewer" within the definition contained in section 4 of the Public Health Act, 1875. If it were a "sewer," the defendants were by section 19 of the Act bound to cleanse it. The channel was an open one, carrying off surface water from the road, and in the channel were gratings or gullies to carry the water into a deeper underground drain. The channel also carried off water from the roofs of some of the houses at the side of the road, and from the curtilages of those houses by means of pipes connected with the channel. Some sewage matter had found its way into the channel, but not through any fault of the plaintiff, who occupied one of the houses; it came from another house. Section 4 of the Act provides that: "'Drain' means any drain of and used for the drainage of one building only, or premises within the same curtilage, and made merely for the purpose of communicating therefrom with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed. 'Sewer' includes sewers and drains of every description, except drains to which the word 'drain' interpreted as aforesaid applied, and except drains vested in or under the control of any authority having the management of roads and not being a local authority under this Act." By section 19: "Every local authority shall cause the sewers belonging to them to be constructed, covered, ventilated, and kept so as not to be a nuisance or injurious to health and to be properly cleansed and emptied." Mr. Justice Phillimore held that the channel was a "sewer" within section 4, and that it was the duty of the defendants to cleanse it. And he granted an injunction, and gave the plaintiff £30 damages. The defendants appealed. The Court now dismissed the appeal. Lord Justice Vaughan Williams was of opinion that the decision of Mr. Justice Phillimore must be affirmed. There was no ground for differing either from his finding of the facts, or from the law as he had applied it. What were the facts? The rain-water from the roofs of several houses, and the surface-water from the ground in their curtilages drained into this space or channel at the side of the road. It followed that this channel, if it did in fact constitute a "drain," was not within the definition of a "drain" in section 4. Then the definition of "sewer" included "drains of every description," except certain specific drains, one of which was a "drain" as previously defined. It was quite plain that this channel was a drain of some sort, and it was not within the exceptions in the definition of "sewer." This being so, the only remaining question was whether this portion of the highway over which the surface-water ran was within the words "drains of every description" in the definition of "sewer" in section 4. It was contended that it was not, because it was difficult to define its lateral extension—that there was no edge separating it from the highway. This did not make any difference. The Court must have regard to the purpose for which the channel was made. It was made for the purpose of draining the water from the surface of the road, that the water might be held in a confined space until it reached the grating which was to carry it away. Under the circumstances it appeared plain that the channel came within the

words "drains of every description." It carried off the water from the road, and also from some of the houses. His Lordship only decided that in the present case the learned Judge was right in holding that this channel was a "sewer" which the local authority were bound to keep in proper order. He did not decide that an agricultural drain carrying off water from several separate premises would necessarily be a "sewer" which the local authority were bound to keep in order. It was said that it had been decided that a drain might be a "sewer" for some purposes and not for others. If that was the effect of the decision in "Kinson Pottery Co. v. Poole Corporation" (1899), his Lordship could not agree with it. But he did not think it decided anything of the sort; nor was it necessary for that decision to do so. Lord Justice Romer and Lord Justice Stirling delivered judgment to the same effect.

A HEYWOOD ARBITRATION AWARD.—Mr. Robert Evans, F.R.I.B.A., F.S.I., Eldon Chambers, Nottingham, has issued his award in the claim of Earl Wilton against the Lancashire and Yorkshire Railway Co. for compensation for lands compulsorily acquired at Broadfield, Heywood—viz., 1a. 2r. 18p. on the north side of the railway, and 2a. 3r. 27p. on the south side. The total amount of the claim was, approximately, £1,500. The witnesses for the claimant were Mr. W. H. Elwell, F.S.I., and Mr. James Green, F.S.I. (Messrs. Weatherall and Green). On behalf of the company, Mr. H. Sheldermine, F.S.I., estate agent to the company, and Mr. J. Sellers, land agent, Bury, were called. The arbitrator has awarded the claimant the sum of £947 11.

ESTATE AGENT'S COMMISSION.—Mr. Justice Kennedy and a common jury, in the King's Bench Division, heard on Tuesday a case in which Messrs. Giddy and Giddy, house and estate agents, carrying on business in the West-end, sought to recover commission said to be due from Earl Russell in regard to the sale of Amberley Cottage, Maidenhead, to Mrs. Atherton, the wife of Colonel Atherton. The defendant admitted that Mrs. Atherton was introduced by the plaintiffs, but denied that the sale was the result of such introduction. The property was eventually disposed of for £1,140, and the jury, finding in favour of the plaintiffs, and that defendant had promised them double commission, assessed the damages at £140 5s.

WHAT IS "CHIPPENDALE" FURNITURE?—Mr. Justice Darling and a common jury, in the King's Bench Division on Monday and Tuesday, tried an action brought by Von Zivergerberg, a Swedish gentleman, residing in London, against Messrs. Herbert and Co., furniture dealers, Tottenham Court-road, for damages for alleged false representation and breach of warranty in respect to the sale of furniture. Counsel, in opening the plaintiff's case, said his client bought furniture from the defendants to the amount of between £400 and £500, and among the articles he bought were some described as "Chippendale" furniture, but were really "Chippendale pattern," and distinctly inferior. To the plaintiff the name "Chippendale" carried the idea of old furniture. Certain other articles were alleged to be tapestry, but they were not tapestry, but were serge. Counsel argued that when a person calls an article "Chippendale" it was a warranty that it was made by Thomas Chippendale, and not merely furniture after the style of Chippendale. Counsel said his client was told that what he was buying was antique furniture. The defence to the action was a denial of false representation and a breach of warranty. The plaintiff then gave evidence, and said he was shown the furniture, which he was told was good old second-hand furniture by Chippendale, and worth three times the price asked. There were a sideboard, a mantelpiece, twelve chairs, and two armchairs, and he was asked £60 for them, which he agreed to pay. He had paid defendants altogether £485. In cross-examination plaintiff denied that what the defendants represented was that the furniture in question was "in the Chippendale pattern." He did not know that it was almost impossible to obtain real Chippendale furniture now, and that the pieces he bought, if genuinely antique Chippendale, would have been worth about £300. Mr. Leroni, a traveller in the furniture trade, said he considered the furniture was of ordinary quality, and had been sold at from 15 to 20 per cent. more than was charged by ordinary retail firms. In cross-examination, witness said the so-called Chippendale was a crude copy of Chippendale. Whether a reasonable man expected to get a Chippendale suite for £60 in Tottenham Court-road would depend upon the statements made to him. For the defendants evidence was given that the furniture supplied was well worth the money paid by the plaintiff. The term "Chippendale" was a recognised term in the trade to denote furniture of that pattern. Genuine old Chippendale was very difficult to obtain and was very expensive, and the defendants represented the furniture in question to be of the Chippendale pattern. Mr. Chiswell, the man who made the "Chippendale" chairs, said that he generally charged 30s. apiece for them. Mr.

Marler, a director of Gillow and Warrig, of Sloane-street, said he had valued the furniture in question, which was accepted in the trade as "Chippendale" furniture, at £100, a larger price than the defendants had charged. The price of £60 was a very reasonable price for the furniture he saw. He could not understand how the chairs he saw could be produced at 30s. apiece. In the result the jury found a verdict for the plaintiff for £50 on the claim. Judgment was given in accordance with the finding of the jury.

Our Office Table.

SOME seven years ago the noble sum of £100,000 was handed over to the town council of Edinburgh, as a bequest from Mr. Usher, for the erection of a memorial public hall. After heated controversies over the choice of a site, it has at length been determined to erect the Usher Hall on the land in Castle-terrace, now occupied by the Synod Hall buildings, belonging to the late United Presbyterian Church of Scotland. The site has only one good frontage, but that is placed between the parish council and school board offices on the high ridge overlooking the north-west angle of the gardens in the valley, beyond which is the High-street. It was originally expected that the building to be erected on so prominent a site, near the centre of the favourite view of Edinburgh, would be selected by competition; but acting on a recommendation from their Lord Provost's committee, the town council recently decided, by 32 votes to 14, to intrust the work to Mr. Morham, the city superintendent of works, a proposal which has aroused widespread dissatisfaction among those concerned for the amenities of the city. In view of the fact that this decision comes up for confirmation at the meeting of the council to be held on Tuesday next, a well-attended and influential public meeting was held on Friday night in Dowell's Rooms, George-street, under the auspices of the Edinburgh Citizens' and Ratepayers' Union, to urge on the council that competitive plans should be invited. Sir Colin G. Macrae presided, and in a stirring speech urged that the talent and genius of the council could not be evoked if important public works were intrusted to officials. An example of what competition could evolve was shown by the Scott Memorial, opposite the selected site for the Usher Hall, where an obscure and little-known young architect was successful out of 54 competitors. It was stated that the late Mr. Usher desired that a design should be selected in open competition. A resolution was unanimously adopted strongly disapproving of the plans for the Usher Hall being entrusted to the city architect, and urging that the design should be thrown open to competition.

Mr. F. W. Ruck, of Maidstone, the county surveyor, has addressed a letter to the members of the Kent County Council on the subject of Mr. D. Joscelyne's recent trenchant criticisms in his report on main road management in the county, epitomised in our issue of the 16th ult., p. 533. He proceeds first to deal with the matter as it affects him personally, inquiring into the cause for his implied dismissal in Mr. Joscelyne's recommendation for the appointment of a competent engineer-surveyor, who, it is suggested, should be obtained from outside Kent, and therefore new to the county and its influences. He deduces from Mr. Joscelyne's remarks the fact no sort of incompetence, inefficiency, or negligence in the performance of his duties can be charged upon him, and that the expert only finds that he is overworked. He admits his partnership in the firm of Ruck and Smith, but states that it is now undertaken by his partner alone, he devoting the whole of his time to the work of his appointment. He emphatically declares that he has never received any pecuniary or other advantage for the use of quartzite or any other material, and that he has no interest in any contractor's business. He cites his long association with road management, and protests his competency to manage the roads under the suggested district control system, or to carry out any reforms that may be decided upon; and he adds that he cannot suppose the council would willingly part with a county servant of his standing except upon the clearest proof that he is incapable of carrying out the duties pertaining to his office to the best interests of the county.

COMMENTING ON Mr. Joscelyne's criticisms of the collection of materials, he points out that there are really 5,237, instead of only 1,320, stone

depots—a fact which bore very materially on the question of second haulage upon which Mr. Joscelyne laid stress, and he quotes other counties which have such depots and do not take stone direct from stations or wharves to the roller. He enumerates the difficulties and disadvantages of purchasing material by weight; against these the advantages of the depot system are named, and he recalls the fact that in 1898 the number of assistant surveyors was reduced to four. Dealing with the preparation of estimates, Mr. Ruck argues that the actual experience and knowledge of their roads of the assistant surveyors is likely to be of more practical use in deciding which roads require repair than any procedure on hard and fast lines. He combats the statement that the roads are over-metalled, and says that now the haunches of the roads are thoroughly strengthened he looks forward to the quantity of material being annually lessened. Mr. Ruck controverted the suggested waste of between £200,000 and £300,000 on the roads during the past twelve years by asserting that an inspection would not bear out a statement which meant that 32,288 yards of material had been annually used that were not required.

A MEETING was held on Wednesday at the Society of Antiquaries, Burlington House, under the presidency of Lord Balcarras, M.P., for the purpose of founding a National Art Collecting Fund, analogous to the society already existing in Paris and Berlin, with the object of securing pictures and other works of art for our national collections. Viscount Knutsford moved a resolution constituting a council, and Canon Rawnsley seconded the motion, which was unanimously carried. Other resolutions in accordance with the object of the meeting were spoken to by Mr. Justice Darling, Sir Wyke Bayliss, Mr. Humphry Ward, Mr. Holman Hunt, and others, and adopted.

THE first meeting of the 150th session of the Society of Arts will be held on Wednesday evening next, when an address will be delivered by Sir William Abney, K.C.B., vice-president and chairman of the council. Among the papers to be read before the Society after Christmas are: "Lessons to be Learnt from the Fire Brigade Appliances at the late International Fire Exhibition," by Mr. Edwin O. Sachs; "Organ Design," by Mr. Thomas Casson; "Mahogany and other Fancy Woods available for Constructive and Decorative Purposes," by Mr. Frank Tiffany; and "Artificial and other Building Stones," by Mr. L. P. Ford. A course of three Cantor lectures on "The Majolica and Glazed Earthenware of Tuscany" will be given on successive Monday afternoons in the spring, by Mr. Langton Douglas.

THE Carpenters' Company are holding their annual examination on sanitary building construction in their hall on November 26 and 28. It is expected that the number of candidates entering will be as large as in previous years; but we would draw the attention of intending candidates to the fact that the last day for sending in their names is very close. We understand that the Company's certificates, and more especially the medals awarded, are more prized each year; candidates find, even in distant colonies, this hallmark of knowledge helps them in their careers.

THE report and recommendations of the departmental committee appointed to inquire into the administration of the Scottish Board of Manufacturers have just been published. The committee recommended that the Board of Manufacturers should be reconstituted and reduced in numbers, and its name should be changed to Board of Trustees. The duties of the board should be the administration and management of its accumulated funds, and the application of its income for the advancement of art in Scotland. They should further exercise a general supervision over and ultimate control of the National Gallery and National Portrait Gallery. They should also continue to hold in trust Dunblane Cathedral. A new school of art for Edinburgh should be established on the lines—so far as possible—of the Glasgow School of Art. The Applied Art School should be incorporated with the new school, but should remain subject to the control of Sir Rowand Anderson as long as possible. The constitution of the National Gallery should be assimilated to those of the National Galleries of London and Dublin. The present curator and his successors in office should bear the title of "director." He should possess liberal powers in the purchase of pictures, and in the general management of the gallery as a going
